With our present luxuries of gas, electric light and safety matches we can hardly appreciate the trouble our grandfathers had in lighting a fire, and the miserable light there must have been in old times. Tinder-boxes, with their accompanying flint, steel and tinder, early forms in wood and later in iron or tin, were on every mantelshelf, whilst in the houses of the more wealthy elaborate tinder-boxes which had the piece of flint firmly fitted into jaws, were fired off after the manner of a pistol. Rushlight holders of varying patterns and types were inserted in huge wooden blocks, or stuck into the beams of the houses of the poorer people, while the better class had stinking tallow dips which necessitated the frequent application of the snuffer. Candle snuffers and snuffer trays were then even more common in a household than card trays or ash trays are to-day. True, one may occasionally yet see a silver or plated pair of snuffers on a similarly elaborate tray, but they are now ornaments in the drawing-rooms where candles are unknown, and as often as not are modern imitations made to sell. The evolution of the modern safety match is very interesting when one can get a series from the sulphur tipped chip of wood to the present time. Then there were the various forms of congraves to the brimstone matches, and so on to the varieties we are now familiar with. Various fancy appliances for lighting cigars, &c., were in vogue at different times.

In the old days each farmer carried in his pocket scales for weighting guineas and other coin, as a safeguard against counterfeits, and in many other ways was equipped with odds and ends such as would be exceedingly strange to people of to-day. The keys in his pocket were of a very different type from those now used, and his old turnip watch and fob, which are now being revived by "fashionable" people, was quite in keeping with his time. Other objects which ought to be secured before it is too late might be mentioned to great length, but if one just mentions one or two which have recently been obtained it must suffice. Amongst these are moulds for making gingerbread; sand boxes, somewhat resembling pepper pots, used for drying ink before blotting paper was known; old forms of door knockers and other door furniture; in fact one might go on *ad infinitum*.

It is as well when possible to get a series of objects illustrating the various advances which have been made from the earliest to more recent times. To some extent this has been done with our matches, and we have also been similarly successful in illustrating the evolution of the

spinning-wheel and the bicycle. Our earliest specimen of the latter is the dandy-horse, consisting of a crosspiece and pair of wheels which took the weight of the body, whilst the means of propelling was by the toes on the ground pushing the dandy-horse forward. The next specimen is the wooden boneshaker, most properly so named; then the iron boneshaker; and later the high 52-inch wheeled bicycle. Following this was of course the solid-tyred safety bicycle; the cushion-tyred; then the pneumatic-tyred; and finally the motor bicycle, which most of us probably wish to see as defunct as is the boneshaker.

In bringing these items before your notice I do so with the dual object of showing that there is much interest in comparatively modern things, and also as a hint to our Beverley friends, who are thinking about having a museum, of a probable way of getting together an interesting and useful collection of objects without very much expense.

OLD BASING AND BRAMLEY.

THE last excursion of the season of the members of the Hampshire Field Club and Archaeological Society was to Old Basing, Sherfield and Bramley. The first halt was made, says the *Hampshire Advertiser*, at the site of the Old Basing House, the famous Cavalier fortress which played so prominent a part in the Cromwellian war and so gallantly withstood the attacks of Waller, though later on it had to yield to the forces of Cromwell, who afterwards razed to the ground what must have been a truly palatial building. Lord Bolton, the owner of the estate, who granted special facilities for the visit, has been carrying out considerable excavations on the site, the results of which are as interesting as they are surprising. The whole of the ground plan of the "Castle" has been laid bare, including the spacious courtyard, paved with flints, and an excellent idea may now be formed of the size and arrangement of the large circular building, the ramparts round which are still almost as perfect as when they were used to repel the fierce assaults of the Parliamentarians. Entering the site across the moat, where the remains of the curtain wall with two flanking towers are still visible, the visitors proceeded to examine the results of the excavations. The party spent about an hour and a half on the site, one feature of special interest being the crypt of the chapel, which was used as a dungeon for prisoners, and whose artistic efforts in drawing galleons are still visible on the ruined walls. They next visited the little museum just outside the ramparts, in which are displayed many relics of the siege found in the excavations, including a large number of cannon balls, bullets and a few skulls, and other evidences of the severity of the attacks on the fortress. Mr. Dale, the secretary, called attention to a bottle which was used for sack, and said that during the clearances of the Simnel Street area at Southampton some sixty or seventy of such bottles were found, but were all smashed, with the exception of about half a dozen. One bottle showed that the Marquess of Winchester had his own wine bottles made, as it bore his initials and his coat of arms. The visitors then proceeded to the columbarium or pigeon-house, and then went on to the adjacent barn or so-called riding school. Mr. Dale called attention to the fine Tudor brickwork of the entrance piers. Not only were the bricks smaller than those now in use, but they were most carefully laid and the work was very durable. There was a very good specimen of similar work in Cuckoo Lane, at Southampton, at the former entrance to Bugle Hall. The fine timber roof of the barn was a puzzle to him, and if they saw it on a stone building of the fifteenth or sixteenth century they would probably say it was as old as the building itself. But the barn was of brick, and that knocked away the idea of so early a date, unless it had formerly covered another building of stone, which, however, did not appear likely. It was not older than the Commonwealth period, or the early part of the seventeenth century. Sometimes people in churches told them these fine roofs were made of sweet chestnut, because spiders then would not build in them. He had no faith in that idea. He did not know why spiders should not build in sweet chestnut; at all events, the roofs were too high up for anyone to examine.

A move was then made to Old Basing Church, a building which has been previously visited by the Club, but is always interesting, especially by its connection with the Paulet family and the uses that were made of it during the military operations in the district during the Civil War. In

the Paulet chapel a brass has recently been erected on the east wall in memory of the members of the family who are interred there, the names being copied from those found on the coffin plates. These begin with Margaret, Countess of Wiltshire, who died in February 1682, and finish with Maria, Countess of Bolton, who died in November 1863, there being thirty-three names in all. There is also here a Flaxman monument to the "most noble Prince Henry, Sixth Duke of Bolton, premier Marquis of England." He died on Christmas Day 1794. Canon Hessey, the vicar, was from home, but his wife courteously met the party and explained some of the leading architectural features of the church. She said it would be noticed that some of the arms and initials on the Bolton shields, as well as the inscriptions, were unfinished. This was because the Italian artists engaged in the work fled during the siege of Basing House and did not return. Mr. Dale said the members of the Club often had churches explained to them by vicars and rectors, but this was the first time in his experience of twenty-one years that a vicar's lady had performed that agreeable duty, and he was sure they all heartily thanked Mrs. Hessey for her kindness.

The party then went on to Sherfield-on-Loddon to pay a hurried visit to the Decorated church of St. Leonard, which was restored in 1872, and then drove to Bramley Church, which is highly interesting, especially for its wall-paintings, the most noteworthy of which is a thirteenth-century representation of the murder of Thomas-a-Becket. There is a fine tomb to the memory of Bernard Brocas (who died in November, 1747) in the Brocas Chapel, with recumbent figures by Banks. Brocas, the inscription tells us, was a "Lieutenant-Colonel of the North Hampshire Militia, who was descended from a long race of ancestors as remarkable for their loyalty and attachment to their king and country as for their many other virtues." There are also some interesting brasses. Mr. Dale read a paper, prepared, we understand, by Mr. Eddy, from which we make the following extracts:—

Bramley Church in its older parts belongs to the Norman Transition style of architecture. It dates from 1220 A.D. at latest, but its original features have only been brought to light since 1870. The old exterior walls are best seen on the east and north sides. They are very thick and are built of flints and tiles brought from Silchester. The transept, known as the Brocas or Beaurepaire aisle, belonged to the Brocas family, who owned Beaurepaire from the fourteenth century down to 1870. It was built in 1801. The heraldic vanes represent a Moor's head crowned, the crest granted to a redoubtable Brocas, who cut off the head of a king of Morocco. His monument is in Westminster Abbey. The tower was built in 1636-40. The present doorway within the porch occupies the position of one of the original windows, a piece of which is to be seen in the wall to the right of the door. The oldest interior stonework may be recognised by its fine quality and by its crosswise tooling. It came, he believed, from the Isle of Wight. The font is of Purbeck marble; the corner pillars are a restoration made in 1891, when a shapeless mass of brickwork was taken down and the curious base was discovered, with the marks where the corner pillars had stood. On the west side of the basin is the Norman dog-tooth. On the east side seem to be the remains of a lamb and a flag. The gallery was erected in 1728 "for the servants and young people of the parish." . . . There were originally four Norman windows in the north wall (Norman Transition). In 1870 no traces of these were visible. The westernmost had been blocked up before the gallery was built, and is now half-hidden by it. The next window eastward had been enlarged in the fifteenth century into a three-light Decorated window. It contains some painted glass of the same date—the Sun of York and the Brocas arms. The third window, now restored, and showing a figure of Faith in stained glass, given by Miss Brocas, had had its splay cut straight back on both sides, and a square wooden frame inserted under a low brick arch. (When the upper arch was discovered the head was found plastered over and painted red.) The fourth and easternmost window, now restored and enriched with a figure of St. Hubert, the patron saint of huntsmen, given by Mr. Alfred Thornton, had been walled up before 1604, for the monument to Reg. Hannington of that date, now over the priest's door, was affixed to one of the jambs; in front of the other was a marble slab, now in the chancel floor. Beneath is the aumbry or cupboard, where the Communion plate was kept. It was stolen in 1712, and the flagon now in use was given by Mr. Brocas in 1714. The

east window is of a much later date, and belongs to the Perpendicular style of architecture. . . . The priest's door, dating perhaps from the fourteenth century, had been blocked up in 1848 and was reopened in 1878. In repairing it some ancient floor tiles were found built into the wall. These have been imitated for the chancel floor. The rood was a figure of our Saviour on the Cross, with St. Mary and St. John standing beneath. After the Reformation the roods were destroyed as idolatrous, and the rood-lofts, and even the screens, went down with them. In 1673, according to the Bramley churchwardens' book of accounts, the "Roode-lofte is taken down, and a poticon (partition) made up where it stode." Just to the westward of the Brocas aisle was discovered in 1874 the south doorway, formerly the principal entrance to the church. I claim the credit of having discovered all the paintings in the church. It was once covered with them. The earliest were perhaps painted in fresco, *i.e.* on the plaster when wet; the rest in distemper, *i.e.* on coats of whitewash. After the Reformation texts took their place, and were renewed from time to time. In some places, *e.g.* the Brocas aisle, the successive coats of plaster and paint may be seen like the layers in a sandwich, showing how, as one picture faded, another was painted over it. The painting of St. Christopher between two of the windows on the north wall is the most elaborate in the church. . . . The picture of St. Christopher was always painted opposite the church door, that the eye might rest on it first, which was thought to bring good luck. . . . Above the now blocked-up south doorway is the most interesting picture in the church, the murder of Thomas-a-Becket. He was murdered on December 29, 1170 A.D., and the picture may have been painted within fifty years of the event. The four knights have each triangular shields and chain armour. The foremost of them (William de Tracy) strikes with a level sword at Edward Grimm the sacristan, whose figure has unfortunately perished, only his surplised arm holding the archbishop's crozier being now visible. The second (Reginald Brito) thrusts his sword downwards into the Saint's head (Becket is on his knees). Out of this sword grow two roses. The third knight is also striking across the head. This knight must be intended for Reginald Fitzurse, for on his shield is a bear's head with a halter (it looks more like a horse); "urse" means "bear." The fourth (De Morville), too far back to strike, holds his sword erect. This picture formed one of a series under a chequer or dog-tooth edging; next to the left was another, of which all has perished except two figures with ugly faces walking in a procession. The new reredos is in the form of a triptych; it was painted by Mr. Victor Milner in 1885, and given by myself. The well carved altar rails came from Hexham. There were originally two altars of stone, a high altar and a lady's altar. They were "ridded" in 1541, and a table made, but they must have been re-erected under Queen Mary, for they were taken down again in 1561. One of the altar stones was sold to John White in 1589, "to laye upon his father," who was buried in the church. . . . The wooden panelling of the roof is a feature common to many Hampshire churches. There are two sets of it, one at the east end of the chancel and one at the east end of the nave. They seem to date from the Tudor period. East of the screen is a monument to Dr. Shaw, the Eastern traveller, in the shape of the Egyptian pyramids which he visited. His epitaph relates that his fame will outlive even these. This monument stood on the east wall, and its removal disclosed the painting of the Virgin and Child. The Beaurepaire aisle is modern, but the archway leading into it must be ancient, for the pillars had round capitals now broken off, and the stone arch was bordered with painting. It contains a brass to Richard and Ales Carter, who died at Bramley in 1529 and bequeathed to the church two cows. There is also a brass to Gwen More, wife to John Shelford and "modyr to the Abbess of Shaftesbury." She died in 1504. The handsome Brocas monument was sculptured by Banks, who also carved the beautiful figure of Chaloner Chute in the chapel of the Vyne. The inscription is legendary; there are no traces of the Brocas family in England before the time of Edward II. The window contains some very valuable glass, much of it belonging to the best period of glass painting, 1480-1520, the work of the Liège school. The window was restored in memory of Mr. Henry Welch Thornton. . . . Mr. Henry Welch Thornton restored the tower, Mr. Alfred Welch Thornton the floor of the nave, Mrs. Welch Thornton the Beaurepaire window. The east window was put up, the organ provided and the bells rehung by subscription. The

chancel, the seats and the font were restored by myself during my incumbency of Bramley, 1860-92.

The party then returned to Basingstoke.

THE COLONNADE.

ALTHOUGH the beauty, the grace, the picturesque effect of Grecian and Roman architecture are universally admitted, it is contended by many, to whose opinion some deference appears to be due, that the colonnade is but ill adapted to our climate. Colonnades and porticoes are delightful beneath the sunny skies of Greece and Italy, but in this country, at best, they are declared to be beautiful and costly absurdities, in which propriety and comfort are sacrificed to display. It is also urged that however tasteful they are considered as mere decorations, that the application of them in modern architecture is at variance with one of the first principles of correct taste, namely, that nothing can be essentially beautiful that is misplaced and misapplied. How far a license in this respect is admissible, when we consider that architecture is an ornamental as well as a useful art—that it not only provides for our necessities, but, like the other fine arts, addresses itself to the imagination and enlarges the sphere of our more refined gratifications—it is not our purpose to inquire: it will be sufficient to suggest that they can in England also possess the recommendation of utility and convenience.

Provided it were well founded the above objection would prove, if not utterly fatal, at least disagreeable, inasmuch as it gives considerable vantage ground to those who seek to depreciate the efforts of modern architects, maintaining that their system itself is erroneous, and that the style of the ancients can never be rendered subservient to our purposes. If our climate be indeed so ungenial as to render sheltered but open ambulatories perfectly useless; if our atmosphere be so inclement as altogether to destroy the effect of those ornamental sculptured details which confer such a charm on the edifices of antiquity, it will perhaps be unavailable to offer to the critics we have to contend with any plea derived from intrinsic beauty. We must confine such embellishments, they will say, to the interior of our dwellings. We must not erect loggias exposed to bleak winds and pelting storms, nor, merely to gratify the eye, form colonnades to exclude the sun and catch not grateful breezes but chilling draughts of air. Such are the cavillings that have again and again been made, probably under the influence of an ague or an asthma, for on listening to them one might be induced to ask why, since sunshine is such a rarity and luxury to us, we contrive blinds and Venetian shutters to exclude it, and what can induce English ladies to adopt fans and parasols which, although they may be exceedingly useful in India, are merely incumbrances to them in our northern clime, for which they were not originally intended? That the colonnade was admirably adapted to the latitude of Greece and Italy no one will dispute; but surely it does not thence follow, as objectors would have us infer, that it is worse than useless in our island. As well might it be said that an umbrella is excellently contrived to serve as a screen against the rays of a tropical sun, its very name indicates its destination, consequently it is highly absurd to employ it otherwise. Those who inveigh against the application of the colonnade as a mere architectural luxury, at once expensive and inconvenient, appear not only to forget that the sun does sometimes actually unveil his face to us, as appeared during several months of the present year, and that shade is often desirable during some portion of the year, even in this formidable climate of ours. They also forget that what in a hot climate is adopted for the sake of shade may here with equal propriety be employed for the purpose of shelter. Neither do they consider that we can derive both advantages from it—shade in summer when the sun is high, and shelter in winter when that luminary is too low in the horizon for the colonnade to cast a shadow of such depth as to darken the rooms before whose windows the columns project.

If, however, it be still urged that such sheltered walks are quite exotic, let us look for an example and authority in our indigenous architecture—in that style in which our ancestors excelled, and which we are assured is expressly formed with reference to our climate. Now in the Gothic style, which has been emphatically designated English architecture, we meet with frequent examples of the cloister or covered walk, so well adapted both for shelter in winter and shade during summer. We must, therefore, either admit that the colonnade—and the cloister is to all

essential purposes nothing else than one—is compatible with our climate, or confess that we have lauded our own architecture too highly; since, although native, it offers us examples of that very same arrangement which is alleged as a formidable objection against both the Grecian and Italian styles. Should we, however, not be allowed to avail ourselves even of such a precedent we must still contend that there must be something of utility in the colonnade or its substitute, whatever be the form it assumes; else wherefore have we borrowed from India its verandah and applied it indiscriminately to houses both in the country and in town, and that, too, in every aspect? It can hardly be alleged in its favour that it possesses any particular beauty to recommend it; that it is better adapted to a moist climate than a construction of stone, or that it harmonises better with the style of our buildings. That it is more economic will not be denied, but when we speak of architectural beauty we must not examine our object with the eyes of a surveyor, nor must we forget that we are now estimating architecture merely as a fine art. We are not endeavouring to prove that its refinements and the pleasure derived from it are indispensable any more than those of the other arts; it is because they are elegancies that they are also superfluities. Yet it really seems unfair to demand from architecture, and from architecture alone, that regard to economy which we hardly deem any recommendation to our other enjoyments.

Undoubtedly it is possible to display beauty of form and proportion even in the plainest structure, so as thereby to captivate the eye; and greatly is it to be regretted that this is a point so little attended to, and that we so rarely meet with this recommendation to atone for the absence of embellishment. If, however, we would enjoy the luxuries of architecture, we must not grudge their cost. The passion for them may be censured as folly, but it is assuredly not the most contemptible or injurious of our follies. To expend some thousands on the exterior of a residence may be deemed extravagance, by those very persons, too, who would not scruple to lay out the same sum on a diamond ring or a cabinet picture. Yet setting aside every consideration as to the enjoyment derived by the possessor of the mansion from the contemplation of its beauties, and the occupation which he thus affords to numerous artisans, it may be doubted whether, if vanity has at all influenced him, he will not obtain full as good interest for his money as the owner of the ring or the picture. Until, therefore, paste be preferred to diamonds (and the former glares on the eye nearly as well as the latter); until a print by Strangé be preferred to the original by Titian, let us not eternally be reminded of economy. Admitting, then, at once that architectural display is a luxury—an exquisite, a refined, yet a costly luxury—it is assuredly not so prevalent or so offensive as to require to be restricted either by a sumptuary law on the part of the legislator or by the more severe penal law of public opinion, a passion for architecture being nearly as intellectual as that for dogs and horses. One thing, too, is indisputable, namely, that whether he builds to gratify his vanity or his taste, or both, he who erects a splendid mansion or villa contributes to the enjoyment of others, as it will rarely happen that the structure is altogether secluded from public gaze. There are no restrictions upon admiration, and in matters of taste to admire is also to enjoy.

We have mentioned the verandah as a proof of the inconsistency of exclaiming against the unfitness of Grecian architecture to this climate, while at the same time no scruple is made of employing what is equally objectionable and still more exotic; and it must be allowed to form a very strong point in favour of that side of the argument which we are here advocating, for if we not merely tolerate, but admire these kind of constructions and obstructions before our dwellings, frequently allowing creeping plants to climb up the trelliswork, so as not only to form a dense shade, but also serve as a lodgment to rain and moisture; we may surely without any imputation on our judgment employ the colonnade as a more pleasing object, more durable and capable of being rendered more decidedly useful and applied to a greater variety of purposes. The colonnade—which term we here make use of by way of distinguishing it from loggias or from porticoes surmounted by a pediment—has seldom been employed by our architects, except for the purpose of uniting the wings to the centre of a building, owing to which it mostly serves merely as a corridor to the offices, and being likewise seldom higher than the basement (where there is one), has been of too inconsiderable proportions to form an important feature

in the design. Rarely, indeed, more correctly speaking we might perhaps say never, have the columns of the central portico been continued along the rest of the front; yet, although it is by no means desirable that such a method should be generally adopted, it might occasionally be had recourse to very advantageously, so as to impart a varied yet regular and consistent degree of richness to the whole composition. Great diversity of effect might be produced according to the depth of the colonnade and the manner in which its elevation was treated; that is, by sometimes carrying the order of the portico in one uninterrupted line on each side the centre; by terminating with a wing or pavilion at the extremity; by detaching it from the portico itself; or, again, by varying the order in these parts from that in the centre. This, it must be admitted, would open a very extensive field to the architect compared with the present monotonous system, while the result would be not only infinitely more graceful and picturesque, but under many circumstances highly convenient.

With regard to mere convenience, it may not be improper to anticipate here an objection that will probably be made. We admit then that when attached to the front of a private residence in a town, except it be merely as a shelter to the entrance, a colonnade can hardly claim the merit of any great utility to the occupier, however convenient it might be rendered to passengers in the street as a shelter from rain. If placed on a basement, however, it will at least afford all the advantage to be derived from a verandah, and will not only produce a more imposing and nobler effect, but in fact possess the advantage of the latter appendage without its inconvenience, inasmuch as, being loftier, it would not obstruct the sun so much from the windows to the rooms on the first floor. We ought not therefore to censure architecture as inapplicable to our domestic structures, unless we are ready to acknowledge also that we have attempted to naturalise what, without any intrinsic beauty to recommend it, is still less suitable in itself. In country residences, on the contrary, the covered walk, whatever be its name, or whatever form it may assume, may be rendered not only a classical embellishment, but a positive advantage—not, indeed, an indispensable convenience, but a luxurious accessory. Whether it be a portico of columns or an arcade, or, supposing the Pointed style to be selected, an open cloister, an ambulatory of this description will be found conducive to recreation and will afford an agreeable and salubrious promenade even at those times when the adjacent lawn and walks may be too damp to admit of the exercise of walking, especially to the delicate or invalid. Besides, its contiguity to the principal sitting-rooms—and care should always be taken to arrange the plan so that it is immediately connected with them, even where they do not open upon it—is an additional recommendation that ought not to be overlooked.

Not a little depends upon the aspect under which we consider things. We are told that open loggias and galleries, however beautiful in themselves as ornamental and picturesque objects, are absolutely unfit for a moist climate—for one where sunshine rather than shade is desirable. And undoubtedly if we choose to view them as rooms exposed to the air, they would be censurable; but they are not to be so considered, for they do not leave exposed what would otherwise be enclosed, but, on the contrary, they shelter what, without them, would be undefended either from wind or rain. When we listen to the cavilling of some of our chilly critics we might almost doubt whether it were possible for the human frame to endure exposure to our inclement atmosphere, even in the months of July and August; for whenever anyone speaks of the beauty of Grecian architecture, and of the richness of its pillared scenery, they are sure to remind him of our northern latitude. There are times, we admit, when even the shelter of the colonnade does not afford so agreeable a place for promenading or lounging as the gallery or conservatory. Yet if we condemn the former on this account, we ought in mere justice to confess also that the flower garden is equally unfitted for this climate, because we cannot enjoy it in the depth of winter when it is buried in snow; or with equal reason might we exclaim against the conservatory, as being not the coolest retreat in the dog-days. There is surely no reason why, of all our luxuries, from those alone which are furnished by architecture we should so pertinaciously demand that they should be uniformly well adapted to every season—that we should reject them altogether because it happens that they are occasionally unavailable.

So far from the colonnade being any encroachment on

the dwelling itself, any drawback on its interior comforts, it ought rather to be regarded as an additional convenience, serving as a link between our indoor and out-of-door amusements—permitting us, as it were, to combine them both—and affording a kind of substitute for the garden or pleasure grounds, when other circumstances prevent us from resorting to the latter. The sunbeams may be cheering, the air genial, but the grass of the lawn may be damp; at such a time the colonnade invites us to pace its terrace. Nor is it less delightful to pass from the gaily-lit drawing-room to such an *al fresco* gallery, when the moonbeams play upon its columns, now silvered by their touch, and thence to gaze on the surrounding landscape. Were we epicures in architecture, we should not grudge to bestow more attention on picturesque effects, even were our climate far more unpropitious to the enjoyment of them than it actually is; yet although a man may, without any disparagement to his judgment, cross the Channel from France, for no other purpose than that of dining on turtle in perfection on a particular day, he would doubtless be stigmatised as a fool were he to erect a rich architectural façade that he might have the pleasure of contemplating it. As long as our follies are like those of our neighbours we may indulge in them with impunity; it is only when the objects of them differ from theirs that they discover we are not altogether so wise as we ought to be. Apropos to this observation, we must be permitted to add another more pertinent in support of this point of our argument, which is this—the gratification arising from the amenities and graces of architecture is attended with a permanent satisfaction that continues after the positive delight they afford has subsided, and outlives the consciousness of actual admiration. The sturdy utilitarian, who affects to despise whatever does not directly minister to corporeal indulgence, and whose doctrines, if followed up, would banish all but the substantial pleasures of eating and drinking, ought in consistency to admit that, except as far as it is necessary to vegetation and temperature, sunshine might very well be dispensed with altogether as a superfluity in the scheme of the physical world.

UNIVERSITY COLLEGE, LONDON.

THE large volume of the Calendar of University College, London, indicates the extent to which ancient and modern studies are combined. By the Act of last year the status of the college has been altered, for it is now part of the University of London, and is in a better position for carrying out advanced education. The architectural department has also a completeness which was wanting in the days when Hoskins, Donaldson and Hayter Lewis had to perform all the duties almost single-handed. The following questions set in the class examinations are enough to suggest the range of the teaching:—

BUILDING MATERIALS AND CONSTRUCTION.

I.—First Year.

1. Draw to inch scale the plans of heading and stretching courses of a brick gate-pier three bricks square, with a 14-inch wall bonding into it on one side and a projection 9-inches wide and 4½-inches deep on the opposite side. The whole to be in English bond, and the joints may be shown with single lines.
2. How would you recognise (a) Portland stone, (b) Ketton stone? State what you know about the durability of Portland stone in London, and name three buildings in London where it has been used.
3. Sketch to about inch scale sections through the foundations of a 14-inch wall in ordinary soil. A wood-block floor on concrete is to be on the inside and the ground-level on the outside, and show (a) the floor above the ground-level, (b) the ground 18 inches above the floor-level.
4. Describe the ingredients and preparation of concrete, and state where it is used.
5. Draw to ½-inch scale a cross-section and rafter-plan of the hipped end of a roof of 20-feet span. There is to be a king-post roof-truss under the apex of the hips. Show the means adopted for tying in the angles of the building.
6. Draw to ½-inch scale the plan and cross-section of a lead flat 10 feet long and 3 feet wide, surrounded on all sides by walls. The outlet is to be at one corner.
7. What kind of asphalt would you use for flat roofs? What are the advantages of asphalt, and how should it be laid on flat roofs?
8. Sketch to about one-eighth full-size details of a

chimney breaking through a roof, showing a section through the roof and soakers with an elevation of the side-flashing at its junction with the chimney gutter. The slating is to be done with Countess slates.

9. Draw to $\frac{1}{2}$ -inch scale an iron roof-truss suitable for a span of 20 feet, and sketch the details of the various joints.

10. What precautions have to be taken in building on (a) rock, (b) made ground, (c) sand?

11. Draw full-size details of a skirting suitable for (a) plaster, (b) panelling, and carefully show all grounds and fixings.

12. Describe wood-block flooring and parquet flooring, and state how each is laid, and illustrate with sketches.

13. Draw to inch scale a four-panelled door 6 feet 9 inches by 3 feet wide. Name the different parts, and fully describe with sketches the various joints.

14. Sketch the linings of the jambs of internal doors suitable for a brick wall 18 inches thick. Show all grounds and fixings.

15. Which woods are generally painted and which not? State other methods than painting for finishing woodwork.

II.—Second Year.

1. For what purposes are the following woods used in joinery:—(a) Oak, (b) mahogany, (c) pitch-pine, (d) American white deal?

2. Draw full-size sections of floor-boards which can be secret-nailed.

3. Draw full-size sections of mouldings suitable for a panelled door 7 feet high and 3 feet wide, showing thickness of rail and panel in (a) oak, (b) deal; and state the number of panels in the doors.

4. Draw $\frac{1}{2}$ full size the head, frame, sill meeting rails and bars of a double-hung sash-window for an opening 6 feet by 3 feet; draw section of stone sill to same scale, and figure all sizes.

5. Draw $\frac{1}{2}$ full-size the jamb, head, sill, mullion, transom and casement style of a wood-casement window, casements to open outwards, and figure all sizes. Window opening, say, 6 feet square.

6. State all you know about the different kinds of plate-glass.

7. Specify the repainting of woodwork already painted, (a) in fair condition, (b) badly blistered.

8. Draw to inch scale the section through the bottom flight of a wood staircase 6 feet long from front nosing to nosing of landing, height from floor to landing 4 feet 6 inches. Show construction, newels, balusters, &c.

9. Describe ordinary three-coat plasterwork on brick walls and mention any substitutes.

10. A wall is in a dangerous condition owing to defective foundations; describe the procedure necessary to make it safe.

11. Draw the drainage scheme on the plan submitted, figure the size of each drain and state the fall. The rain-water is to be carried into the drain. There is a slight fall on the ground towards the manhole shown on plan.

12. Describe fully the different traps necessary for the above.

13. Describe the different tests for drains and soil-pipes.

14. What causes syphonage of traps, and how can it be prevented?

15. From what sources is water obtained, how can it be stored, and what precautions should be taken to prevent its freezing or becoming contaminated inside and outside a house?

III.—Third Year Diploma.

1. Draw to $\frac{1}{2}$ -inch scale the plans of two courses of a brick wall 18 inches thick, in English bond, 6 feet long from angle to door-opening, with a return-wall at the angle 14 inches thick and 3 feet long from angle to sash-window opening.

2. Discriminate between the following stones, and state for what purposes each is most suitable:—(a) Bath, (b) Portland, (c) York, (d) Hopton Wood.

3. What causes damp in buildings? Describe the precautions necessary to prevent it.

4. A room 30 feet long by 18 feet wide is to have a floor of steel girders and wood joists. Draw the plan of the floor to $\frac{1}{2}$ -inch scale, figure the scantlings of the joists and girders and give sketches of the construction. Chimney-breast 6 feet wide and 18 inches projection on one side. No restrictions as to thickness of walls, positions of windows, &c.

5. Specify a suitable fire-resisting floor for a room of the same size, and state the different ways it can be finished on top.

6. The above is to be covered by a lead-flat with a gutter on one long side only. Draw the plan of the flat to a scale of a quarter-inch to the foot, state falls and sketch details of plumbingwork.

7. A brick wall is 30 feet long by 18 inches thick, and the ground falls 3 feet from left to right. Draw to a scale of a quarter inch to the foot the elevation of the wall, damp-course, and stepped footings, &c., from the ground-floor downwards. Also one cross-section $\frac{1}{2}$ -inch scale showing ground-floor joists, &c. The damp-course is to be 3 inches above ground at highest point. There is no basement. For the purposes of determining depth of footings wall above ground-floor may be taken to be 25 feet high and the soil to be gravel.

8. Draw to $\frac{1}{2}$ -inch scale the skeleton forms of steel roofs suitable for spans of 30 feet and 50 feet, and sketch joints and connections to fair size. Angle of roof 30 degs.

9. Describe the construction of (a) stone stairs, (b) concrete stairs, and illustrate by sketches.

10. Illustrate by sketches the construction of a wood staircase, either newel or geometrical.

11. Draw to $\frac{1}{2}$ -inch scale the elevation of a stone mullioned and transomed window 6 feet 6 inches high by 6 feet wide in the clear, sketch the details for the same and figure their sizes.

12. Describe the precautions to be taken to prevent sewer-gas passing from a sewer or cesspool into a room where there is a sink or lavatory basin.

13. Specify the possible materials and sizes of pipes for (a) rising main (constant supply); (b) branch services; (c) waste from lavatory and from bath; (d) branch soil from water-closet; (e) soil-pipe; (f) branch and main drains; (g) ventilating pipe.

14. A wall is in a dangerous condition owing to defective foundations. Describe the procedure necessary to make it safe.

15. Draw to $\frac{1}{2}$ -inch scale the cross section through a billiard-room lantern, and sketch details of its different parts and figure sizes of each.

HISTORY OF ARCHITECTURAL DEVELOPMENT.

Third Year Diploma.

1. Trace the development of church planning in Italy from the fourth century to the end of the tenth.

2. Analyse the principal differences in plan and proportion between English and French cathedrals of the thirteenth and following centuries.

3. Illustrate by sketches the development of piers and arches in England from the eleventh to the fifteenth century, both inclusive.

4. Describe and illustrate by sketches the differences in form and construction of the domes of the following buildings:—(1) Pantheon, Rome; (2) Sta Sophia, Constantinople; (3) St. Vitale, Ravenna; (4) Florence Cathedral; (5) St. Peter's, Rome; (6) St. Paul's, London; (7) Les Invalides or the Panthéon, Paris.

5. Compare Roman, Romanesque and Gothic vaults, and state in what respects English and French vaults differ after the twelfth century.

6. Explain how the thrusts of ribbed vaults are concentrated and counteracted.

7. Compare and contrast Sta Sophia, Constantinople, and St. Mark's, Venice, especially as regards the plan.

8. To what extent did the buildings of ancient Rome influence the planning of Renaissance churches? and state in what respects the plans of the latter differ from the plans of Mediæval churches.

9. Write a brief account of Renaissance work in England between 1520 and 1760.

The Marylebone Borough Council last week by a small majority decided to refer back a proposal to engage an architect at a cost of 100 guineas for the purpose of drawing up a report and making a preliminary sketch plan as to the suitability of suggested sites for a new town hall. An effort was made to defer further consideration for six months and until the ratepayers have been consulted. At the same meeting the Council adopted a report of the works committee setting out that they had inspected the site of St. Paul's Church, Great Portland Street, in connection with an application for consent to the erection of a concert hall thereon, and had informed the superintendent architect of the London County Council that they objected to the application as it interferes with the rights of the public. The proposed concert hall is estimated to cost 200,000l.

GENERAL.

His Majesty has lent to the exhibition of the Collected Works of Mr. Holman Hunt, which opens on Saturday next at the Leicester Galleries, Leicester Square, the picture entitled *The Beloved*, which was painted for Queen Victoria.

H.R.H. the Prince of Wales has sent Sir William Treloar 5*l.* as a donation to his Crippled Children's Hamper Fund. The fund has for special reasons been opened much earlier than usual this year, and His Majesty the King, as has already been stated, has sent his annual subscription of 10 guineas. The object of the fund is to send a hamper of Christmas fare direct to every crippled child in London who cannot attend the annual Children's Banquet at the Guildhall. On an average 7,000 hampers are thus despatched every Christmas, each containing enough to enable the child to act as host to its family for the day. Subscriptions should be sent to Alderman Sir William Treloar, 69 Ludgate Hill, E.C., who has now kept the scheme going for thirteen years.

The "Public Health Engineer" has been amalgamated with the "Local Government Officer," and now appears as "L.G.O.," as the official organ of the National Association of Local Government Officers. It contains much special information. The publishing offices are 50-52 Ludgate Hill.

In the London University buildings, Imperial Institute Road, South Kensington, Mr. Banister Fletcher began on Monday a course on "The History of Architecture. On Tuesdays, at three and eight, Mr. Percival Gaskell, R.B.A., will begin a course on "Italian Painters." The architecture course will deal with Egyptian, Greek, Roman and Byzantine architecture, and it is proposed that it should be followed by later courses bringing the history down to modern times.

The New Buildings at the Royal College of Science, South Kensington, were occupied for the first time on the 4th inst.

Mr. Herbert Johnson, for many years on the art staff of the *Graphic* and *Daily Graphic*, died suddenly in a railway carriage between Brockenhurst and Southampton West. Mr. Johnson represented the *Graphic* at many important ceremonies at home and abroad, and accompanied the King when, as Prince of Wales, he visited India.

The Annual Meeting of the Society of Architects will be held at Staple Inn Buildings on the 18th inst. at 8 P.M., when the officers and council for 1906-7 will be elected.

Archaeological Lectures on the church of St. Bartholomew-the-Great, Smithfield, on Saturday afternoons, have this autumn, owing to the lamented death of the late rector, been postponed until Saturdays, October 27 and November 3, at 2.30 P.M.

The Late Mr. Thomas Barnes-Williams, who died at the age of fifty-eight, of 98 Piccadilly, W., architect, has left property of the estimated value of 60,141*l.*

At a Meeting of the Liverpool Cathedral committee on Monday it was announced that progress was being made with the lady chapel, the foundation-stone of which was laid by the Duke of Connaught on July 17, and that the erection of the cathedral itself would be started this month. Two windows in the choir were allotted for memorial purposes, one being a stained-glass memorial to Mr. Gladstone, the cost being borne by the Liverpool Gladstone Memorial committee, by whom a statue of the deceased statesman has already been placed in St. John's Gardens. The other memorial window will be to Sir Thomas and Lady Earle.

The Longforgan Parish Church, near Dundee, contains an old tombstone in perfect preservation, dated 1400 A.D., to the memory of one Dame Margaret Golightly, of that parish. A full-length portrait of Dame Golightly is carved on the stone, and also that of her husband, while a small male figure appears at their feet. The stone has been placed on a pedestal and fitted into the inside wall of the church, for its better preservation.

The Art Gallery Committee of Manchester are considering the practicability of using the buildings in their parks as picture galleries to afford accommodation for the works crowded out of the Mosley Street Galleries. An experiment has already been made at Heaton Park Hall.

There have recently been found at the works of Josiah Wedgwood & Sons, Etruria, letters and documents relating to Josiah Wedgwood, and containing interesting biographical information which none of the biographers have yet touched. They will be printed in book form. Numerous fine specimens of early Wedgwood ware have also been discovered.

The Earl of Leven (in addition to bequeathing 40,000*l.* for the restoration of the Chapel Royal at Holyrood, on the stipulation that the work should be carried out by Mr. Thomas Ross, of Messrs. McGibbon & Ross) left a sum of 20,000*l.* to his widow and his eldest son, upon trust to expend the sum in the formation of a family burying-place at Glenferness, requesting them to act in the matter under the direction of Sir John Stirling-Maxwell and Mr. Ross, architect.

Lori Burton, who is patron of St. Paul's Church, Burton-on-Trent, has instructed Mr. G. F. Bodley, R.A., to prepare plans for a new screen of wrought-iron, and richly ornamented, to occupy the arch in the north transept near the pulpit.

Over Ninety Designs had been sent in for the Convalescent and Nurses' Home, Glossop, which is to be erected at a cost of 30,000*l.*, and which is to be presented to the town. These designs will be examined by the assessor, Mr. Paul Ogden, of Manchester, and the author of the design placed first will be appointed the architect to carry out the work. A site has been secured for the home between North Road and Glossop Park.

The Bournemouth Town Council have abandoned the municipal buildings scheme, estimated to cost over 100,000*l.*, and it is probable a new scheme will shortly be prepared.

The Brighton General Purposes Committee have had before them a letter from the secretary of the Royal Commission on Coast Erosion, stating that the Royal Commission wish to take evidence from well-known engineers, and inquiring whether Brighton would be willing to furnish evidence. The borough surveyor, Mr. Weller, is authorised to give evidence before the Commission.

A Copy of the "Great He" Bible, so called from the fact that the word "he" is used instead of "she" in Ruth iii. 15, has just been restored to Ambleside Church, having been purchased by a few residents at Colonel Rhodes's sale. The book, which was taken away from the church under circumstances which have never become known, was in use in the old chapel at Ambleside from 1612 until early in the eighteenth century.

The Council of the Institution of Civil Engineers has made the following awards in respect of papers dealt with in 1905-6: Telford gold medal to Mr. G. A. Denny (London); George Stephenson gold medal to Professor W. E. Dalby, M.A., B.Sc. (London); Telford premiums to Messrs. W. R. Baldwin-Wiseman, M.Sc. (Southampton), G. N. Abernethy (London), H. R. C. Blagden (Alexandria), M. R. Collins (Jersey), and James Kelly (Preston); a Crampton prize to Mr. P. T. Gask (Peru). For students' papers the awards are: Miller prizes to Messrs. Ralph Freeman (London), A. F. Harrison, B.Sc. (Manchester), A. J. Grinling (Derby), T. R. Grigson (London), J. W. D. Ball (London), and A. Morris (Manchester). Mr. A. F. Harrison also gained the James Prescott Joule medal.

The Works Committee of the Westminster City Council will report at the next meeting of that body:—"That they have had before them a plan submitted by Mr. Belcher, on behalf of the fund for the memorial to the late Duke of Cambridge, which shows the position and design of the base of the statue proposed to be erected in Whitehall. The City Council on July 27, 1905, approved a site for the statue on the refuge opposite the Horse Guards, but the plan now submitted shows a site opposite the portico in the centre of the new War Office. This change would necessitate a slight rearrangement in the arc-lamps at this point." The works committee will recommend:—"That no objection be offered to the plan now submitted, subject to Mr. Belcher's paying a deposit to cover all expenses the City Council may be put to in connection with the matter."

The Statue of John Knox to be erected in St. Giles's Cathedral, Edinburgh, has been placed in position in the Albany chapel. It was designed by Mr. Pittendrigh Macgillivray, R.S.A., and is of bronze set on an ornamented stone pedestal and surmounted with a canopy, which is supported on pillars of dark marble. The inscription on the pedestal reads:—"Erected by Scotsmen at home, in Australia, in Canada and the United States." The memorial will be unveiled in about three weeks' time.

Workmen are engaged, under the auspices of the Crown, in the repair of the Donjon Tower of Arbroath Abbey. A staircase communicating between the vault and the dungeon, which has for many years been closed up, has been reopened. The original access to the dungeon will now therefore be available. Other improvements have been effected. Some portions of the abbey have yet to be pointed with cement.

The Architect.

THE WEEK.

THE Merchant Venturers' College at Bristol, which was destroyed by fire in a couple of hours on Tuesday morning, would have been interesting as an early experiment in the planning of technical colleges. It was erected some twenty years ago, and several experts gave advice on the planning. At the time of its construction Gothic had not passed out of favour, and the style is paramount in the building, although treated with unusual freedom. In the seventeenth century COLSTON, a Bristol merchant, left property to trustees to found an almshouse and a free school where the pupils were to be boarded as well as taught. About thirty years ago the Charity Commissioners proposed to erect a girls' school and a trades' school out of the income. But it was found that sufficient money was not available. By the generosity of the Merchant Venturers' Society the financial difficulties were overcome, and the building which succumbed this week was erected at a cost of about 55,000*l*. It became one of the most important technical schools in the country, although in the new building the old arrangements are not likely to be followed. During the last twenty years much more is known about the purposes which such a building should serve, and we may assume care will be taken to introduce the results of experience in this country and elsewhere.

In a late number we noticed some allegations about the cleaning and restoring of some paintings belonging to the Corporation of York. The education committee have made a further investigation, and have obtained a report from an expert. They have come to the conclusion that the work of renovation has been carried out in a thoroughly efficient manner, and without causing damage to the pictures as alleged, although no doubt the picture by ANSDALL and FRITH has at some time been damaged, but not by the restorer. They also consider that the treatment of certain pictures by washing and varnishing, and by the use of a "medium," injured those so dealt with, and particularly in the case of the picture, *The Mother*, by Joy, and that irreparable damage may be done to pictures if so handled. They also wish to state that such treatment of the pictures referred to was unauthorised. One member, after hearing the report of the committee, said that one of the sheep by ANSDALL was endowed with motor goggles, and he wished to know by whose order the addition was introduced. An alderman who is a member of the education committee said his suspicions were increased. There was an angry discussion, but finally the report was adopted. Those who have pictures to give away will do well to remember that "renovation" is practised in York "in a thoroughly efficient manner."

In the Journal of the Royal Victorian Institute of Architects is a portrait and memoir of the late DAVID CHRISTOPHER ASKEW, who was one of the vice-presidents. He was an Englishman and was born at Workington in 1854, and was in his fifty-second year when he died. After leaving school he was for a year engaged on cabinet-making and joinery, and then left for Australia, arriving in Melbourne in 1869. He worked with his brother-in-law, Mr. EDWARD TWENTYMAN, for some years. He attended the civil engineering course at the University from 1878 to 1881 (his coach being Mr. A. WATSON), taking his C.E. degree in May 1882. With Mr. TWENTYMAN as partner, in that year he commenced to practise as an architect, and was not long in being recognised as an able practitioner, especially in works of an engineering nature. His

early drawings prove him to have been an efficient draughtsman, although during the last few years he used his pencil but little. The only competition in which he engaged was for the design of the Cairns Memorial Church, East Melbourne, which he succeeded in winning early in the eighties. His practice in shops, warehouses, offices, &c., was large. He was of a retiring disposition, and when writing specifications for his large buildings preferred to remain at home. As an arbitrator he had great experience, his services were frequently in demand, and his awards were always accepted as from a mind never tinged with bias. He was esteemed by the profession, and, it can be added, was held by his contractors and workmen to be an ideal architect. He always maintained that when an architect saw a workman doing a bit of especially good or difficult work a word of encouragement would go a long way, and make the worker a happier man.

ALL visitors to Edinburgh will remember the columns on Calton Hill, which are the survivals of an effort to reproduce the Parthenon as a memorial of the Scotsmen who fought in the French war against NAPOLEON. The attempt was more expensive than had been anticipated, and the work was abandoned. Since that time many suggestions have appeared about resuming operations and using the completed building for some purpose. In connection with the late inquiry into the necessity for a new Scottish National Gallery the structure on the Calton Hill has been often mentioned. Mr. WILLIAM MITCHELL, Writer to the Signet, has prepared a pamphlet on the subject, and the proposal has found so much favour that the Lord Provost's committee have recommended that 100 guineas be voted by the Town Council towards the expense of circulating it. Mr. MITCHELL considers "that the disgrace attaching to Scotland in connection with our national monument might now be wiped out by completing it for our National Gallery; and that, for this purpose, there is in the hands of the Board of Manufactures about 40,000*l*. of purely Scottish money, which it rests with the Scottish people, if they see fit, to have so applied, leaving the institutions for the promotion of science and art in the Scottish capital, and the buildings in which they are housed, to be duly supported by subsidies from the British Treasury, like those voted towards similar institutions in London and Dublin." The savings are hardly sufficient to pay for resuming the reproduction of the Parthenon. It is doubtful whether a Greek temple if faithfully copied would serve for the exhibition of paintings, and if the memorial must be completed it should be used for the preservation of trophies of Scottish valour. The Calton Hill is not considered by all architects as an eligible site for a picture gallery. But if one is to be erected it should be of a kind which would allow the pictures to be displayed with advantage to the artists.

It could not be denied at the meeting of the London County Council on Tuesday that the trees on the Thames Embankment were damaged in connection with the laying of the tramways. The Chairman of the Parks and Open Spaces committee insisted that the extent of the damage was far larger than was necessary. The roots of ten trees had been severely cut. Further lopping would be necessary if ordinary cars were employed. When the trees were planted it was not anticipated that a double line of tramway would be laid down, and more or less injury was therefore inevitable. To have special cars constructed would affect the traffic and would not be approved by travellers. So much is sacrificed in London to what is supposed to be a necessity, the outcry about the trees must appear extraordinary. If old buildings had to be partially or entirely removed to make way for a tramway the majority of people in London would remain indifferent.

MR. HOLMAN HUNT'S PAINTINGS.

MOST of the pictures by Mr. W. HOLMAN HUNT which are now on view in the Leicester Galleries have been already exhibited. Visitors who from time to time have seen them elsewhere will be glad to perceive how kindly the years have treated them. There are few modern English pictures which after half a century have not lost much of any brilliancy they originally possessed, and in consequence there is generally a discord which was not contemplated in the artist's arrangement. Mr. HOLMAN HUNT had always a preference for strong colours, and their use gave rise to some of the objections raised against his work. Some pictures which once appeared rather harsh are now mellowed, and if they are less striking than when they were first displayed they are more satisfactory. The creator's ability as a painter can be tested by them without any of the allowances on account of fading which are put forth as excuses when dealing with the works of many artists. In this case, at least, time cannot be made responsible for shortcomings.

To the majority of visitors the pictures will probably be strangers, unless by repute. Amateurs of our day may be puzzled to discover why such works should have been at one time abused as if they were acts of treason against the supremacy of English art. "My name," says the artist, "was treated as a proverb of ignorance and wrong-headedness little short of criminality." When most enthusiastic Mr. HOLMAN HUNT could not sell a picture or get a commission for a portrait, and he tells us he was glad to accept a job in cleaning and restoring paintings at the Trinity House. Drudgery of that kind was enough to make any man disheartened, and Mr. HOLMAN HUNT had almost resolved to abandon painting. If critics and the public have become more tolerant, the change must be ascribed mainly to the numerous exhibitions in London of the works of individual artists. Through them the importance of independence in thought and vision has been recognised, and experiments have been approved which were far more extravagant than any of those by the pre-Raphaelites. Anyone who is accustomed to such exhibitions is not likely to be startled by the collection of Mr. HOLMAN HUNT's works.

The artist's methods have been discussed so often, it is not to be supposed that any new qualities can be discovered in the works he has produced. There is no doubt the painter was one of the precursors of modern realism. The word is now taken to express a treatment of details, especially in literature, which is not warranted by any conventional laws of decency. *The Awakened Conscience*, by Mr. HOLMAN HUNT (which is not in the exhibition, although a small reproduction of it appears in the catalogue), suggests the temptations which are before an artist whenever he proposes to present life as it is. But in an age when the insipid plates in "Books of Beauty" were supposed to represent not only English art but English virtue, there was some excuse for those who had the courage to challenge the self-satisfaction of artists and their patrons.

The *Claudio and Isabella*, which was painted in 1850, both in subject and treatment could be taken as a rejection of prescribed rules. The scene represented is not one for reading in the domestic circle. The play from which it was taken was long unknown to theatre-goers. To represent a scamp standing on one leg, as if shrinking from worms approaching him in the grave, was contrary to any rule of composition then known. An earlier drawing suggests that although only two figures were employed it was necessary to make changes in posing them. It was a disturbing picture for spectators, and the *Hireling Shepherd*, which was painted in 1851, was of the same category, for it was suspected to be symbolic, and as such could not be approved, especially by ecclesiastics. It was painted at Ewell, where MILLAIS also was experimenting. If it made many country idylls appear absurd, the amount of

detail crowded in the small canvas could not fail to startle the fashionable painters of the time. Neither in the *Ophelia* nor the *Huguenot*, which MILLAIS was then painting, is there such a variety. Not only sheep, but birds and butterflies, were introduced, and we can see the shadow of the hairs of the hireling's eyelash on his cheek. Then came *The Light of the World*, and its impressive mysticism did not give satisfaction to all who saw it, although it is now a popular subject with photographers. It was considered that the days for scriptural paintings had vanished. CARLYLE, who might be supposed to be in favour of mysticism, did not hesitate to condemn the picture when he saw it in the artist's studio, because it was not an exact presentment of CHRIST's life on earth.

Mr. HOLMAN HUNT must have quickly perceived that such realism as is seen in *The Light of the World* depended in a great measure on imagination. The profuse vegetation was English in its origin. It was possible to have a model made for the lamp and to imitate real examples of jewellery and robes. But the Bible is an Eastern record, and only amidst scenes similar to those described in its pages could any approach to actuality be obtained. Incidents from life in the Holy Land and Egypt had been produced by English painters during flying visits, but Mr. HOLMAN HUNT was the first who resolved to settle down in the land of the Bible and to make a study not merely of forms but of manners and customs. To that resolution his most remarkable works are owing. The pathetic *Scapegoat* was painted in 1854 at Oosdoom on the shores of the Dead Sea, and should be considered as a revelation of the coming of a true school of Biblical illustration. *The Finding of the Saviour in the Temple* exemplified in the fullest degree the significance of the change. "All the figures were painted from members of the Hebrew race. The architecture was designed in accordance with the fact that the Hebrew courts of the Temple were constructed after the manner of a vineyard by members of the Levitical family, educated as architects, hence the wealthy but barbaric character of the East." But to obtain representatives of the Hebrew race to serve for models was a difficult task. If one of them went to Mr. HUNT's house, so MILLAIS was informed, "he looks about like a scared bird, and if he sees any piece of carpentry—a window-sash or a border of a panel—that looks in his suspicious eyes like a cross, away he flies, never to come back any more. . . . The Rabbis keep up the bitterness by excommunicating all who come to my house, for they suspect me to be a missionary in disguise." In spite of such difficulties the picture, which now belongs to the Corporation of Birmingham, was completed, and surprised the Town when exhibited in GAMBART's show-room in 1860. There are certain heads among the world's pictures which, when once seen, cannot be forgotten. In *The Finding of the Saviour in the Temple* Mr. HUNT has added three—the blind Rabbi who tightly clutches the scroll of the law as if it were to be in death as in life his consolation, the venerable brother near him whose faith is disturbed, and the noble student beside them who appears to look into the future as if he were a prophet. The SAVIOUR is an intellectual athlete with the head of a ruler, and recalls the Infant in the *Sistine Madonna*. The picture was purchased for 5,500*l.*, and many speculators would offer four times that amount for it at the present time.

An artist who occupies himself with such efforts cannot be expected to engage in ordinary works. The *Lantern-maker's Courtship*, a humorous experiment which shows a young man endeavouring to remove the veil from an Eastern girl, was painted in 1854. The *King of Hearts*, a little boy in fancy dress posing as a miniature HENRY VIII., is dated 1862. A small but interesting painting of a girl kneeling on her bed—*Morning Prayer*—belongs to 1866. *Bianca*, which was painted in Florence in 1869, represents a young woman holding a mandoline and who wears a large amount of lace. That Mr. HUNT's reputation was then established

is suggested by the portrait of the artist, which was painted in 1868 at the request of the Council of the Uffizi Gallery. He represented himself in the Syrian dress which he wore when painting.

Italy, with all its examples of art, could not overcome the love of the East with Mr. HUNT. In a letter to MILLAIS he said that nearly all the old art was almost puerile as regards dramatic force, and he advised his friend to develop this particular power, by which he would be enabled to attain a higher position than that hitherto occupied in art. In other words, he recommended seriousness of subject as a necessity. With this conviction of a mission we find Mr. HUNT commencing *The Shadow of Death* in 1869 and *The Triumph of the Innocents* in 1870. In both we have a proof of an intense imagination. The former work now belongs to the Corporation of Manchester, and it has been exhibited several times. There are two versions of *The Triumph of the Innocents*, both of which are in the Leicester Galleries. In one there is a diffused moonlight over the whole picture. In the second the more subtle plan was adopted of having a mysterious light by which the figures are seen in all their detail. The Innocents are numerous, and although small in size, they have a development of a kind which does not characterise infancy, and which has not been adopted by painters in any age. When the picture was first exhibited we endeavoured to explain the muscular vigour and the absence of delicacy of contour by supposing that the painter wished to suggest that for the Innocents there was to be no further growth, and that they had lost the charm of immaturity. The reason for the peculiarity has not been stated, and may hereafter give rise to some speculation.

Another Eastern subject which must have cost Mr. HUNT much labour is the *Distribution of Holy Fire in the Church of the Sepulchre, Jerusalem*. The scene is no doubt exciting, but it is doubtful whether it can be considered reverential, and it is perhaps better adapted for photography than for careful painting. Apparently disorder prevails, and in such a case it is impossible to determine what is the principal feature. The *Christ among the Doctors* is a large water-colour showing a synagogue school "with a number of the celebrated Rabbis of the time." His love of truth has in some cases caused Mr. HUNT to introduce portraits, although better effect could be gained if he created the faces and figures. An example of this is seen in *May Morning on Magdalen Tower*, concerning which we are told "the artist thought it would add to the historic interest of the picture in future times to introduce some of the college dignitaries and choristers into the group." There are precedents in the works of the great masters for a similar treatment. But we may doubt whether they would have adopted such an arrangement if photography existed, for whatever may be its advantages it has not increased the importance of painted portraits.

The most remarkable of Mr. HOLMAN HUNT's later works is *The Lady of Shalott*. The first drawing was reproduced as a woodcut with other examples of the pre-Raphaelites in an edition of TENNYSON's poems which appeared in 1857. The poet did not consider that it expressed his idea. But Mr. HUNT has painted two versions in oils, which slightly vary from the original design. The last, which was exhibited in 1905, can be accepted as evidence of the painter's powers at their fullest development. The painting, like some others, requires a long description to be fully understood. But if judged in the ordinary way, as that of a girl bewildered by a rebellion among the threads of the tapestry she is working, and who is seen in a beautiful room adorned with reliefs and with a river and picturesque scenery outside, it must be regarded as a success not only for the painting of details, but for the unusual breadth and the unique disposition of colours. The best proof of its success is that it asserts itself amidst a collection of so many earnest paintings.

TRAJAN'S COLUMN.

THE announcement that Professor GIACOMO BONI has been able to complete his restoration of TRAJAN'S Column in Rome must give satisfaction to archæologists. He was allowed to explore beneath the column partly in the hope that some relics of ancient art might have survived. It was recorded that the ashes of the emperor were placed in a golden vase and deposited in the earth on which the memorial was raised, while according to other accounts the globe in the hand of the statue contained them. Many centuries back efforts were made to obtain the vase, and the excavations then carried out did not add to the safety of the column. By means of the careful underpinning which Professor BONI has been able to perform the great work is now almost as secure as when it was originally completed in A.D. 114. Fifteen fragments of the large swags above the pedestal were recovered and refixed approximately.

TRAJAN must appear to moderns as an ideal emperor of a military state. He possessed no hereditary claim to the throne. He probably was descended from a Roman family, but he was a native of the province of Spain, and he owed his selection as successor to NERVA mainly to his fitness as a commander. He realised that the existence of the empire depended on war, and during the greater part of his reign he was engaged in the field against foreign enemies. But during his absence the administration of the city was conducted with unusual ability and honesty. Large sums were expended on the improvement of Rome. Like his predecessor, TRAJAN constructed a Forum, and it must have been a magnificent work. According to one authority it had a roof of bronze. On two sides there was a double row of columns. The triumphal arch was at one end and the memorial column stood in the opposite extremity in an open space between two great libraries. Within the enclosure was a basilica. Professor BONI has revealed the foundations of the libraries, one of which it is believed mainly contained Latin manuscripts and the other Greek. The character of the shops and other buildings connected with the Forum has to be left to imagination. There was an abundance of gilded figures and an equestrian statue which was supposed to be inimitable by other emperors. TRAJAN'S Forum must have been impressive, for, according to a legend, GREGORY THE GREAT obtained the deliverance of the emperor's soul from Purgatory through admiration for the place.

The column, which fortunately has survived, is well-known from engravings, and there is a cast of it at South Kensington. It is believed that the architect employed to design all the buildings in the Forum was APOLLODORUS, who, if reports are true, was murdered out of envy in the next reign by HADRIAN. But although upheld by the authority of DION CASSIUS, modern historians are doubtful of the truth of the latter allegation. We may therefore suppose that the column was designed by APOLLODORUS.

A column which fails to support something is illogical. In this case there was a bronze statue of the emperor over 20 feet in height. It was overthrown, and it is believed that some of the pieces of marble which Professor BONI recovered were broken from the pedestal while the figure was falling, or clumsily taken down. It was also resolved that in addition to serving the purposes of a column, it should become an historical memorial by sculpturing the shafts with scenes from TRAJAN'S contest with the Dacians. The people occupied districts near the Danube; and in Transylvania a plain where one of the battles was fought is still known as the Field of Trajan. It is believed they were Thracians, and they certainly were among the most troublesome enemies of the empire. TRAJAN had to undertake two expeditions against them before he could be assured that they were conquered.

01

It has been calculated that about 2,500 figures are

represented in the spiral, exclusive of the boats, horses, military engines, trophies and other objects. Like the frieze and metopes of the Parthenon a great many sculptors were likely to have been employed on the work. But there can be no question the design came from one artist, who was likely to be APOLLODORUS. Care was taken to avoid degrading the figures of the Dacians, and if they corresponded with the representations they were well worthy to struggle for independence against Rome. With such evidence BYRON was justified in assuming that the statue commonly called *The Dying Gladiator* represented a Dacian warrior. The figures gradually increase in size in proportion to the height. While they are 2 feet at the lower part of the shaft they are nearly 4 feet at the capital. The Romans of the second century must have had better eyes than the majority of present-day visitors if they were able to make out details which were so closely packed. The whole of the figures have fortunately been engraved in De Rossi's book on the column.

We can see all the operations of war as then conducted on a grand scale. It was necessary to cross the Danube by a bridge of boats. On landing the emperor deliberated. Sacrifice was offered, after which TRAJAN harangued his army. The soldiers are next seen erecting defences. Scouts are sent out while TRAJAN examines the improvised fortifications. A couple of Dacians are brought back by the spies. Final preparations for battle are made, and the attack commences. As Jove arrives from high Olympus to aid the Romans, the enemy is quickly defeated and their fortresses are burned. The Dacians then send men to sue for peace, but as the terms are not acceptable the contest is renewed. By order of TRAJAN the women and children are placed out of danger. The Dacians retreat until, meeting with friendly cavalry, they again attack the Romans in one of the new fortresses. The siege is raised by the arrival of additional troops, and TRAJAN is able to surprise the enemy. In another place we see him listening to his scouts. There is a fresh battle, with similar results. Then Victory appears and inscribes a shield with a record of the successes, and in that way the first war comes to an end.

The second invasion in the preliminary stages resembled the first. But this time the triumph is more complete. The Romans are represented in an early scene as showing the head of DECEBALUS, the leader, to the Dacians. The enemy must have lost both courage and hope, for it seems to be easy to make them prisoners. Their settlements are set on fire, and the women and children are seen along with the cattle journeying to more remote regions. In all the scenes the Romans are shown as an irresistible power. But all through we can realise the influence of discipline. The horses of the enemy are so well protected, it may seem to be difficult for any other than Roman infantry to resist them.

Although the pillar relates to the Dacian war, TRAJAN was also engaged in Syria and the neighbouring countries. Indeed, the Senate is said to have offered him as many triumphs as he cared to claim, and it is related that the celebration of his victories occupied four consecutive months.

The column is of Roman Doric. The height has been variously estimated. It is generally supposed to be 97 feet without the pedestal and 115 feet with it. It is therefore about 20 feet higher than the York Column, but nearly corresponds in height with the column in the Place Vendôme in Paris. The shaft is said to consist of twenty-three blocks of white marble. JOSEPH WOODS, who appears to have scrutinised the construction of the column, says that "in this case it appears that the Romans, instead of making a flat and horizontal joint, formed a variously and irregularly undulating surface on the one piece and cut the other to correspond with it, a laborious and difficult process, of which the object seems to be merely to hide the joint, for the strength of the column would not be increased by it." The diameter of the column at the base is

12 feet and at the summit 10 feet. The pedestal is adorned with representations of Dacian arms and other trophies.

When the Ulpian basilica existed in front and the library buildings at the sides it must have been difficult to obtain a glimpse of the column, unless from a position from whence it could not appear to be very impressive. From an inscription on the pedestal we must suppose that one of the purposes of the column, if not the principal one, was to indicate the depth of the excavation of the Quirinal Hill which had to be undertaken in order to obtain the level ground necessary for TRAJAN'S Forum:—"Senatvs . Popvlvsqve . Romanvs . Imp. . Caesari . Divi . Nervae . F. Nervae Traiano . Avg. Germ. Dacico . Pontif. Maximo . Trib. Pot. xvii. Imp. vi. Cos. vi. P. P. AD . declarandvm . quantae . altitudinis mons . et . locvs . tantis . operibvs . sit egestvs." A modern railway contractor would smile at seeing so much trouble to record so small a quantity of earthwork, but it may have been a difficult task to perform within so circumscribed an area. Inside the column is a winding staircase of 185 steps. There is some uncertainty as to whether the statue of TRAJAN remained perfect or only a fragment of it when Pope SIXTUS V. ordered TOMMASO DELLA PORTA to model the statue of St. PETER which now stands upon the column. It is an anomalous crowning for the memorial, and it fails of its effect, for as long as Rome endures the column will be known as TRAJAN'S, unless in some fanatical outbreak it is reduced to dust.

THE ARCHITECTURAL ASSOCIATION.

THE opening meeting for session 1906-7 of the Association was held on Friday evening last at Tufton Street, Westminster, Mr. R. S. Balfour, president, in the chair.

Seventy-nine nominations for membership were read.

On the motion of the President a vote of thanks was passed to Dr. Pritchard for a donation of several hundred lantern slides and negatives, including sets illustrating Indian, Italian, Dalmatian, German and English architecture.

Prizes and Awards, Session 1905-6.

A.A. Travelling Studentship, value 25*l.*, and Silver Medal, A. Winter Rose. Second Prize, value 5*l.*, E. Brantwood Muff. A.A. Medal, value 10*l.* 10*s.*, T. W. Watkins. A.A. Essay Prize, value 10*l.* 10*s.*, and Silver Medal, G. Sanderson. Banister Fletcher Bursary, value 25 Guineas and Medal, Cecil Pinsent. Saxon Snell Scholarship, value 50*l.*, Vincent Hooper. Architectural Union Company's Prize, 10*l.*, R. C. Foster.

SCHOOL OF ARCHITECTURE.

Elementary Class of Design.—Prize value 3*l.* 3*s.* and Bronze Medal, Percy May. Certificate, H. P. L. Cart.

Advanced Class of Design.—Prize value 5*l.* 5*s.* and Bronze Medal, J. L. S. Dahl. Certificate, A. H. Brownrigg.

DAY SCHOOL.

First Year.—Book Prize for first place in History and Construction tests, G. F. Clarkson. A.A. Sketch Book for first place in Freehand Drawing tests, G. D. Gordon Hake. Book Prize for best work in Studio during whole session, L. Keir Hett.

Second Year.—Extra Studentship, free pass to Third Year's Course, G. Sanderson. Travelling Studentship, 15*l.*, P. A. Tilden. End of Session Test, special Prize offered by Master, P. A. Tilden.

EVENING SCHOOL.

Third Year.—First Prize, F. C. W. Dakers. Second Prize, A. N. Peckham. Third Prize, T. F. W. Grant.

Fourth Year.—First Prize, A. Welford and J. K. Ground, equal. Second Prize, B. H. Colclutt. Andrew Oliver Prize, value 5*l.* 5*s.*, J. K. Ground. A.A. Scholarship, value 5*l.* 5*s.*, H. A. Ross.

STUDIO.

Travelling Studentship, value 15*l.*, T. Braddock.

Division I.—Drawings of Old Work, volume of A.A. Sketch Book, F. D. Danvers. Construction, volume of A.A. Sketch Book, F. D. Danvers. Study of Ornament, volume of A.A. Sketch Book, N. W. Hadwen. Design, volume of A.A. Sketch Book, J. Filtness.

Division II.—Design, volume of A.A. Sketch Book, T. Braddock. Study of Ornament and Old Work, volume of A.A. Sketch Book, T. Braddock. Measured Work, volume of A.A. Sketch Book, Digby L. Solomon. Time Sketches, volume of A.A. Sketch Book, C. R. Davy.

LECTURES.

Greek and Roman Architecture (book prize), G. G. Leith. Elementary Construction (book prize), H. D. Ward. English Architecture (book prize), J. Newton. Mediaeval and Renaissance Architecture (book prize), G. Sanderson. Elementary Physics (book prize), W. Craven Rhodes. Geometry (book prize), R. Pierce. Materials (book prize), J. F. Schneider. Construction (book prize), Sir Rupert Ford, Bart. Iron Construction (book prize), Sir Rupert Ford, Bart. Drainage and Water Supply (book prize), Sir Rupert Ford, Bart. Ventilation, Lighting and Heating (book prize), Sir Rupert Ford, Bart. Professional Practice (book prize), C. E. Hanscombe. Land Surveying (book prize), R. J. Tyndall.

The President's Address.

An address was delivered by Mr. BALFOUR. In the course of it he said:—

The approach of autumn, and with it the first general meeting of a new session, awakens in your President for the time being a full sense of the obligations and responsibilities which his acceptance of that office entails.

The Association has hitherto been singularly fortunate in the choice it has made of men to guide its destinies, and having such a tale of names to ponder over, each new President must naturally feel some considerable diffidence and anxiety as to how he may acquit himself in a post which becomes year by year more exacting in its claims and onerous in its responsibilities.

The success or otherwise of a President's term of office depends not merely on his personal attributes and qualifications, but of necessity it is very largely influenced indeed by those who share with him the burden of the day, and on the loyal co-operation and support which they afford him.

If the Association has been fortunate in its choice of Presidents in the past, it has been equally lucky in securing the services of a good committee. From what I have seen of the present Council, I believe that they are, one and all, actuated by the traditions inherited from their forerunners. We are this year all as determined as ever to be of one mind, animated by one single purpose and ambition, namely, the continued and increasing welfare of this Association. If this good fortune always obtains, then I for one see no limit to its era of prosperity and expansion. It possesses within itself all the needful potentialities. Its vitality has been unimpaired, nay even fostered, by the lapse of six decades since its strenuous inauguration of the forties.

The current session completes the sixtieth year of the formation of our Society, and I suppose this fact at any rate entitles me to draw your attention very briefly to its progress, specially during the last decade. When we celebrated our jubilee in 1897 we had a membership of 1,111, and our subscription receipts for that year amounted to 8417. In the nine years which have elapsed since then our membership has gone up by one-third, and last session we had 1,681 members, and the subscriptions that year were 1,4067. We commence the present session with a roll of members numbering more than 1,700, and we may, I hope, be well over 1,800 before the session terminates. That is a very satisfactory position of affairs for us to contemplate, and is surely a very remarkable testimony to the vitality and utility of the Architectural Association.

My remarks have been, so far, more or less a review of our past and present position. I will say something now about one or two matters of importance to us all as members of a large Society.

I want to vacate this chair and hand it over to my successor, feeling that we have set our "house in order," that our roof trees are our own, that the floors on which we tread are honestly paid for, and that the walls which encompass us are secure from the depredations of unsatisfied creditors, and that with a grateful contentment we may contemplate our habitation in this historic region for a thousand years to come. I wonder how many of you are aware that if each member of the Architectural Association who has not already done so contributed only 15s., this 7677. debt of ours would to-morrow morning be an incident in our bygone history. It seems to me incredible that in a Society like this, composed of units all desirous of a common purpose, a Society free from all cliques and

schisms, a Society individually and collectively entirely loyal to their foundation, we should have to deplore the apathy of those 1,032 members who have hitherto forgotten or overlooked the appeals of our late President and Council, and whose lethargic consciences have permitted them to disregard their imperative obligations. I would the more urgently invite you all to help in the riddance of this millstone, because such a comparatively trifling amount is now alone required. I would particularly ask the younger members to subscribe even small amounts, because the senior members of the Association who have but little time to make use of the advantages it affords have in many instances already contributed so handsomely.

It was suggested to me, in one of our publications, I think, that when I took up the reins of office I must see to it that the welfare of the younger members, who use these premises more or less as a club, should have greater attention, and that things should be made more agreeable and comfortable than they are. I do not think any of you have been more fully alive to the need of improvement in this respect than I have been. The Council have recently appointed a house committee to deal with all these crying evils; you will hold with me that it is a step in the right direction.

But we cannot do much until we are absolved from our financial liabilities, and when I again remind you that, roughly, only 37 per cent. of our members have subscribed, you will agree with me that we should all strive to induce the remaining 63 per cent. to contribute to the abolition of this debt without delay. Funds will then be available for making our abode here more inviting, but I would personally go further and say that I look forward to the time when our premises may comprise a complete and regular clubhouse for our members. It rests with you, gentlemen, to inaugurate that happy day.

Besides this, there is another motive to be considered in our endeavours to annul our indebtedness; a matter of some urgency. It appears to me that in the future, and I believe that date is not far distant, we shall be compelled to seek means by which we can make our education and social facilities occupy a larger area than at present.

The A.A. day school, that young but vastly vigorous seedling in which the Association feels the proud proprietorship of parentage, is already bearing good fruit, and it has, moreover, assumed a prominent position in our daily life here. What food for consideration the following figures suggest:—In session 1903-4 there were thirty-two students; in session 1904-5 there were forty-two students; in session 1905-6 there were sixty-three students, and we have started the current session with sixty-five students, with the immediate prospect of several more joining, so that we anticipate having an increase of at least ten this term. Now I want you to understand that these figures by no means represent the grand total of students whom we might have on our books if we accepted all the applications we receive. In the first place, our accommodation is limited and we are by no means desirous of crowding our students. We are not a money-making concern, and therefore our sole wish is to give the best instruction we can under conditions as favourable as the exigencies of the case permit.

Our evening school under its new conditions will, we fully believe, establish itself firmly upon an even more permanent basis than hitherto, now that it has been brought into a line more fully approximating with the requirements of our general scheme. In the past it has been a complete success, and it is difficult to see how it can in any way be impaired by the rearrangement of its curriculum. The Council had every confidence that Mr. T. Frank Green would achieve this goal, and the fifty who have already joined distinctly indicates that they have not been mistaken. One is glad to think that so many of our students attend our evening school and lectures, and they are more worthy of commendation than those who attend the day school, for it is no light effort to summon up courage, after a hard day's office work, to attend the instruction given here, at hours when others are seeking relaxation and amusement. Such enthusiasm brings in the end its own reward, and even at the time it tends to gratify that primitive instinct of satisfaction within one of, as it were, stealing a march on others.

Anyone who has taken the trouble to examine in detail the recently published curriculum of our school of architecture must have noticed a very extensive revision in the courses of instruction. The experience we have gained by past years, those wider and ever-increasing needs of the profession, and the demands made upon us by those who

come to us to be taught, have caused your executive, after careful inquiry and a very full and complete investigation into the numerous suggestions and proposals laid before us, to adopt without any drastic modifications the new scheme prepared with so much care, and after an expenditure of a vast amount of arduous labour by the education committee, who, I can assure you, gentlemen, have, during this last summer, proved themselves veritable gluttons for work. To us it is a gratification to know that a practically unanimous chorus of approval from our instructors has sped our new propaganda to the hands of those for whom it has been drawn up, and so far I have heard nothing but the most favourable expressions from those architects and others who have in the past shown so much solicitude in our educational work.

The undoubted success of our schools will very likely bring us face to face with competition from other quarters, but I do not think we should regard this contingency with resentment or alarm. Indeed, I venture to think we should rather welcome it. It should stimulate our students to endeavour to distinguish themselves and their Alma Mater more highly. It will goad the education committee to continue and persevere in their intention to see to it that the Association schools shall always occupy the premier position amid any other institutions of like character. Moreover, even if competition does injure us, we shall, at all events, have the satisfaction of knowing that it all tends to the general advancement of that art which, in reality, fills so large a place in the daily life of mankind, and yet is so strangely neglected by them.

In drafting our new education scheme, the Council feel that they have by no means come to the end of their tether; they have still many directions in which they would like to enlarge the scope of their enterprise. It is not for me to go into matters of detail of this kind on the present occasion, nor have I any mandate from the Council to do so. There is one branch of study, however, which I think personally might well form part of a post-graduate course, which we hope shortly to institute, and I believe that several, if not many, of my colleagues on the Council would welcome the addition of a life class to our curriculum. It is true that the proposal strikes one as being a great innovation, and we should very likely, I think, have to combat some opposition. I believe, however, that such opposition, if it did come, would emanate from those whose misfortune it has been not to have experienced the advantages of such a course of study.

In the last few years, and curiously coincident with the inauguration of our day school, it has been brought to one's notice—indeed, it is patent to us all—that our profession, through the medium more especially of this Association, is being recruited from a section of the community of a better social status. That is a feature which we all welcome gladly. We hear a good deal about the proper recognition of our calling by the Press and public. It is far too trite a subject for discussion here, so I will merely say this, that if our profession does not meet with its proper deserts, we and not the public are to blame, and it lies with us to see that we only admit to our schools men who will be well calculated to uphold the dignity of the art of architecture. Our day school students come for the most part from the great public schools, and are often graduates from our universities. But that alone, of course, is not necessarily any guarantee of their suitability.

Considerable activity has been shown during the last few months among the junior ranks of the Architectural Association, resulting in the establishment of various societies under the ægis of the parent tree. The Council welcome the formation of these societies for many reasons, but chiefly because they tend so effectually to increase and cement the comradeship which has always been, to some extent, a feature in the career of this Society, and a characteristic which is surely capable of even greater prominence. The recently founded athletic club and the musical society are both notable examples of what I mean, and we have every reason to anticipate their permanent success if we may regard their present flourishing condition as a criterion.

And now I have only one other subject directly connected with the Architectural Association on which I should like, with your permission, to say a few words. It is a somewhat delicate matter, and one which should be handled, if it ever comes before you again, as I believe it will, with more tact, and, if I may say so, with a greater degree of urbanity than it met with some years ago. From time to time your Council receives requests from ladies desirous of

becoming members or of attending classes. These applications we are obliged to decline, because you, gentlemen, voted resolutely in opposition to the proposal for their admission as members. Your decision at that time was of such a determined character that we have hesitated to raise the question again. I, for one, have never been convinced of the cogency of the arguments brought forward, and it has always seemed to me on that one occasion in its career the Association fell away from its vocation, betrayed its traditions and adopted a policy distinctly reactionary in character. Since 1893, however, times have changed; the female sex has with its charming insistence ingratiated itself into many spheres which have hitherto been regarded within the sole prerogative of man. Even the R.I.B.A. has admitted ladies within its jealously-guarded portals of membership, they have invaded the offices of many architects, and from what I can gather all the prophecies of disaster have remained unfulfilled. We welcome ladies to our meetings; our conversazione without their presence would be an entertainment of intolerable gloom; at times they have been known to grace our spring and summer visits with their presence; and yet when they sigh to partake of the more serious side of the Association's work you sternly and even brusquely refuse to listen to their appeals. Surely the electorate of to-day in this Society cannot be misogynists, with such hard and unrelenting natures as the electorate of thirteen years ago. I believe that if we took a vote on the subject now we should find you all prepared to adopt the fashionable "open-door" policy, and be ready and anxious to welcome, metaphorically speaking of course, the fair intruders with open arms.

I do not propose on this occasion to say very much about the architectural happenings of the past year. Of course in London the great event has been the seventh International Congress of Architects. It is not within our province nor is this a suitable assemblage for the discussion of the results it has attained, and the disappointments of some of its procedure. These will of course be dealt with by competent authorities, and in their proper place. So far as we are concerned with it here in the Association, it may interest you to know that although we as a body were unable, owing to the strain we have recently had on our resources, to take any official part in extending a welcome to the Congress, over 330 of our members, including "their sisters, their cousins and their aunts," attended its entertainments and deliberations, out of a total membership (for the United Kingdom only) of about 864. That I think is a sufficient indication of our sympathies.

Another event in the architectural world since the last presidential address was given from this chair has been the international competition for the proposed Palace of Peace at The Hague. If the results of this competition were not such as we could feel unqualified satisfaction with in this country, I trust it will not merely be put down to insular prejudice on our part, engendered by the melancholy fact that none of our British competitors appear in the winning list.

We in this great Metropolis will shortly, as you know, be holding a great competition for the London County Council Hall. The London County Council, with that cosmopolitan benevolence which has so distinguished them since the interchange of visits with our charming neighbours across the Channel, has opened wide the competition lists, and invites all the world to tell the Londoner what his architecture should be like.

I trust, and I believe all, or nearly all, British architects are ready to recognise the merit in the noble modern buildings we see on the Continent and the United States of America, but in this instance I think we have some justification in expressing our dissent from the decision of the County Council. The County Hall has not, and it never can have, any international significance. It is to be a building from which the administration of the affairs of London will be conducted, and a home for those whose duty it is to see to its thousand needs. It is to be a structure for London alone, and London only. All English architects will commend heartily any steps which the County Council can reasonably take to secure a design of the greatest possible merit, but I feel convinced that in London we want—and, gentlemen, I am equally convinced that we intend to have—an edifice which interprets for us the great heritage of our national architecture. We desire in these days to see no alien structure, no matter of what magnificence, set down to face the quiet serenity of our Palace of Westminster and the very heart of this great Empire.

A British brain must conceive this great new building and British hands must alone bring it into being. I trust I am no "little Englander," but I would ask the London County Council, the educated citizen of London, or that particularly common-sense and level-headed member of the proletariat, the "man in the street," whether any of them have for one moment contemplated the possibility of our having raised up for our edification across the river a structure resembling, for instance, the grotesque design for The Hague Palace of Peace, as a monument to the taste of our municipal government, and as an everlasting protest by them against the incompetence of our own architects and as an object lesson to us of what they deem the highest form of our art. I very much fear that the County Council in their collective capacity have not as yet recognised a due appreciation of the broad national characteristics and constituents of our calling which go to form the history of its particular evolution in this land, and still less those subtle phases and delicate variations which invest its study with such infinite charm to the architect himself and to the educated portion of the community. Is this natural solicitude of ours for our own particular national type of architecture an effete product unworthy of consideration at the hands of the councillors?

The London County Council has exercised its beneficent sway actively during its short life and in many respects for the improvement of London, as well as in directions which should more nearly appeal to architects. I hesitate, therefore, to criticise its tendency to lose sight of, among the preponderance of the other interests involved, those matters of artistic importance (minor details perhaps the London County Council would call them) which, in the aggregate, mean so much in their appointed place. It would be a matter for congratulation if the County Council could see their way to institute a committee of taste, whose duty it would be to overlook all new schemes before they are put into actual execution, with a view to the avoidance of such unfortunate solecisms as those which have, alas! been perpetrated in the past, and to safeguard us in the future against thoughtless and unnecessary offences against the canons of art and the beauty of our great Metropolis. I would go further, and urge that this committee should be given the larger reference of seeking how actual æsthetic improvements could be introduced into those proposals which come before them for consideration.

It has been my pleasing duty this evening to hand a number of medals and other prizes to those of our students who have most distinguished themselves during the past session. Such rewards as those we gain in these early stages of our setting out on the career we have chosen bring with them infinitely more sense of satisfaction and pleasure than those larger and more important successes which some (I hope all) of you will attain later on in your professional life. The course of years, the greater occupation of our minds with the duties and worries attendant on the exigencies of actual practice, seldom permit us to pause over the good fortune which comes to some men after what is known as their "student days." Therefore make the most of the opportunities you now have. But you cannot all win prizes, and I would say both to those who have and those who have not, do not set much store on the value of these awards, for they will mean nothing to you later on. Do not forget what Ruskin has said about this:—"It is the 'effort' that deserves praise, not the success; nor is it a question for any student whether he is cleverer than others or duller, but whether he has done the best he could with the gifts he has." The prize-winners here are by no means certain winners in the struggle for the topmost rungs of the ladder of architectural fame, and they may very likely find those coveted situations already in the occupation of those who plodded steadily and quietly through our schools without achieving any very notable prominence. I do not believe in the "genius," so called. It is an uncertain and dangerous rôle to play. "Genius" is generally defined as the "infinite capacity for taking pains." But I think that is a better definition as a rule for what we call "success," the offspring of perseverance and hard work.

Before I close, and as a student myself, may I remind you of a little precept which has always seemed to me particularly appropriate to us architects, when the time arrives for us to meet that wide circle of society whose orbit we must cross in the exercise of our calling. "Do not talk but of what you know; do not think but of what you have material to think justly upon; and do not look for things only that you like, when there are others to be seen." And in conclusion, gentlemen, let me felicitate

those of you who this evening carry off the garlands of victory, and allow me also to congratulate with an even greater degree of heartiness those of you who, while not attaining the goal you strove for, have yet, let me assure you, gained that even greater triumph, in the full consciousness that you have done your best. To each of you I offer my good wishes, and may you one and all for ever zealously uphold the proud and ancient traditions of the Architectural Association.

Mr. E. GUY DAWBER, proposing a vote of thanks to the President, congratulated him on his election to the chair, though the office was one full of responsibilities, since the Association held the premier position for architectural education in Great Britain. While listening to the address he was greatly surprised to hear that as many as 1,032 members had not subscribed one penny towards the building debt. The apathy of these members could not be understood, and it came very hard upon those who had worked for the welfare of the Association. He thought all students, as long as they were members, should help in clearing off the debt, and he hoped this would be accomplished before the end of the session. He agreed with the President that there should be an examination for students who wished to join the day school, for he felt there was rather the danger of making the training too easy and popular. They had a great responsibility upon their shoulders in undertaking training for the profession, and he thought they ought to hesitate before admitting students into their school unless they had proved themselves fitted to become capable architects.

Mr. E. T. HALL seconded the vote of thanks and advocated the admission of ladies to the membership of the Association. Great care, he said, should be exercised in admitting students to the day school, for he understood that no fewer than 25 per cent. of the applicants were rejected as incompetent to commence the studies.

Mr. A. NEEDHAM WILSON blamed the training in public schools for the ignorance displayed by many of those who applied for admission to the day school. To remedy this he thought the Council should get in touch with the head-masters of public schools.

Mr. G. H. FELLOWES PRYNNE also supported the vote of thanks and agreed with Mr. Wilson that the Council should get into communication with the head-masters of public schools, and draw their attention to the neglect of useful knowledge essential to everyday work.

Mr. H. P. G. MAULE described specialising as the curse of school education.

FORESTRY APPOINTMENTS.

THE selection of candidates for the Indian Forest Service is at present done (1) partly by an examination held by the Civil Service Commissioners; (2) and partly by nomination. At the end of the three years' course, successful candidates receive 100*l.* for passage money and outfit, and are appointed assistant conservators of forests at a salary of 350 rupees a month, which, with exchange compensation, may be placed at 300*l.* a year. The grading of the department is such that they can rise to a salary of 2,500 rupees a month, or about 2,000*l.* a year. Indian forest officers can retire after twenty-two years actual residence in India on a full pension, with a maximum of 525*l.* a year, and after eighteen years actual residence on a proportionate pension. There is also a provident fund managed by Government. The recruiting of the forest departments in Ceylon and in the Federated Malay States is effected on lines similar to those applying to the Forest Department of India. Further details can be obtained by applying to the secretary of the delegacy, Professor Schlich, 29 Banbury Road, Oxford. Eighteen nominations will be made during October 1906 (without examination), and candidates for these should without delay apply to Professor Schlich, at the address given above. Candidates must have passed Responsions or an equivalent examination, and bring proof of having a knowledge of physics and mechanics and chemistry, according to the standard of the preliminary examination in the Honour School of Natural Science, Oxford. Some knowledge of botany and German is also desirable, but it will not be insisted on.

A Bronze Statue representing a nude girl with a hoop, by Herr Arthur Lewin Funcke, has been stolen from an exhibition in Berlin.

NOTES AND COMMENTS.

WE suppose there are few architects surviving who have heard of **FREDERIC DIAPER**, who died recently in New York. He was a pupil of **SIR ROBERT SMIRKE**, but he preferred to try his fortune in the United States. He was one of the founders of the American Institute of Architects. **Mr. A. J. BLOOR**, who was his pupil, says that he was rewarded by quick recognition and constant patronage from the merchant princes and wealthy financiers of New York. According to **Mr. BLOOR**, "as far as he found his chance in domestic work my preceptor showed a full appreciation and skilful handling of the Italian Renaissance in its purity, and his buildings emphasised the characteristics of that school with precision and dignity, without the slightest penchant toward the latter-day flamboyancy of its French variety. His designs for exterior work were free alike from pedantic overlaying and from baldness, while his planning was wonderfully apt and complete, and his construction uniformly of the most thorough, stable and enduring character." He was ninety-six at the time of his death, and until a few years ago he was engaged in quiet practice among the children and grandchildren of his old friends and patrons.

In last July, it will be remembered, the Tribunal of Appeal decided against the superintending architect of the London County Council in reference to the lines of buildings in Euston Road. The Council were ordered to pay 110% as costs. It was argued at the time that inasmuch as the appeal was made against a decision of the superintending architect acting in a judicial capacity under powers vested in him by Act of Parliament, and the Council were not a party to that appeal, the action of the Tribunal in ordering the Council to pay the costs of the appellants was *ultra vires*, but the objection was not upheld by the Tribunal. They, however, expressed their willingness to state a case for the opinion of the High Court. The Building Act committee having been advised that the matter is one of importance, which should be authoritatively settled, they have given instructions for the necessary application to be made to the Tribunal, and recommend that the solicitor should take the necessary steps to obtain the decision of the High Court. The case will be interesting, but inasmuch as the appellants were put to expense it would be strange if part at least of their outlay could not be returned to them. According to the Building Act the costs of any of the parties to the appeal, including the Council, shall be in the discretion of the Tribunal. Originally the Tribunal decided only appeals from the superintending architect's decisions as to lines of frontage, but now other acts by him come under their jurisdiction.

It is remarkable how quickly the theory is being accepted that it is advantageous to have all branches of fine art taught together in order that students may obtain more or less acquaintance with all of them. A meeting was lately held in Dresden for the purpose of advocating the necessary changes for the realisation of the theory. **Professor FRITZ SCHUMACHER**, who is an authority, described in detail the official arrangements for the teaching of the arts. He expressed regret that in Saxony architecture, painting, sculpture and industrial art continued to be taught in separate schools. Elsewhere, in Germany and other countries, efforts were made to bring them together, in order that students could realise the relations between them. And he considered that architecture especially would be the gainer if the unity of the arts was more recognised. For only in that way could it have the living spirit which prevailed in past times when the arts were not divided. If all the arts could not be taught under similar conditions, at least architecture and industrial art should be recognised as having the closest connection. There are several artists in Germany who do not adopt those views. But there is no doubt a change is inevitable.

THE completion of the great bronze doors for the cathedral of Milan was celebrated last month with much ceremony. In connection with it there is a curious history. In the fifteenth century several of the great Renaissance artists, including **BRAMANTE** and **DA VINCI**, gave advice as to the completion of the exterior of the building. In the next century the work was entrusted to **PELLEGRINI**. He made a design, but before it was realised in marble he went to Spain in order to erect the Escorial. The design was then altered, and, in fact, the work went on for an indefinite time. **NAPOLEON** expended over three millions of francs on alterations. In 1847 an Italian nobleman offered 100,000 francs towards the expense of doors for the principal entrance, which were to be in bronze. Nothing was done to carry out his intention until 1894, when a competition was arranged. The Milanese sculptor, **Signor POGGIAGHI** was successful. Delays, however, followed, for it was proposed to alter the façade of the cathedral, and the size of the opening was therefore uncertain. At length, however, the doors have been set up. One door represents the sorrows of the Blessed Virgin, the other the joys. As the doors are large and weigh several tons, it will be necessary to employ an hydraulic machine in order that they may be opened and closed with ease. The grouping of the different scenes is considered to be successful, and the new work will increase the interest of the building.

WEIGHTS AND MEASURES OFFICE, CITY GREEN YARD, E.C.

THE new Weights and Measures Office of the City Corporation, in Whitecross Street, is, as shown, a red-brick structure in the Renaissance style, designed by the City surveyor, **Mr. SYDNEY PERKS, F.R.I.B.A.**, and cost about 6,200/. The contractors were **Messrs. JOHNSON & Co., of Wandsworth Common.**

MARISCHAL COLLEGE, ABERDEEN.—ENTRANCE—MITCHELL TOWER.

MEMORIAL OF HIGHLAND LIGHT INFANTRY, KELVINGROVE PARK, GLASGOW.

THACKERAY was not well advised when he condemned the Guards Memorial in Pall Mall. Why should they, he asked, have any special recognition when other men, French and Russian as well as English, fought as well in the Crimea? It was like ordinaire giving itself the air of port. But a wider knowledge of life would have convinced the critic that the ordinary soldier does not grasp the idea of an army in which he is a unit. He is more limited in his belief, and prefers to be counted as a representative of a regiment. The Guards are, or were, the protectors of the Metropolis, and it was right that they should be honoured in one of its thoroughfares. The efforts of civilian rulers to do away with regimental or brigade associations was a failure, and it was found necessary to go back to what was practically the family system. Some of the memorials of the South African war express the old-fashioned but excellent desire of local fame for local warriors. One we now illustrate is an example. It has been erected in Kelvingrove Park, Glasgow, as a tribute to the officers and men of the Highland Light Infantry who fell in 1899-1900-1-2. It was unveiled by **Field-Marshal the Duke of CONNAUGHT** about a fortnight ago. **Mr. BIRNIE RHIND, R.S.A.**, the sculptor, has departed from the stereotyped treatment. He represents the typical soldier as a scout, and thus combines fitness with repose, which is desirable in sculpture. The memorial stands in an excellent position, and the effect against the trees is pleasing.

THE SOCIETY OF ARCHITECTS.

THE twenty-second annual report of the Society of Architects says there is a further marked increase in the strength and influence of the Society. Its membership is still steadily increasing, and there has been a large addition to the register of students. During the past session fifty-seven have been added to the roll of members, three elected to honorary membership, and fifty-four students have been registered, a total of 114. On the other hand, the Society has lost thirty-two by deaths, removals and resignations. The death of Sir Wyke Bayliss deprived the Society of an honorary member who was connected with it for a number of years, and took great interest in its proceedings. The total membership is now 778, a net increase of seventy-five over last year.

Early in the session the Council appointed a committee to inquire into the desirability or otherwise of revising the articles of association. The result is seen in the document submitted to the members on June 28 and confirmed by them on July 19. These new regulations come into force on November 1, and their chief points need only be briefly referred to. It has been decided to do away with the class of associates, the present three gentlemen in that class being transferred to honorary membership. The students who, up to now, have had no recognised status in the Society, are provided for as a class, with their own committee, under the chairmanship of a member of Council. At the request of a number of foreign members, provision has been made to enable them to compound for the annual subscription. The strength of the Council has been increased from twelve to eighteen, and each committee will have its appointed chairman. The office of honorary corresponding secretary has been abolished as no longer necessary. A new class of "retired members" has been formed. Various further slight alterations have been made, all tending towards increased facilities for carrying on the business of the Society.

The Council having been invited by the London County Council to make any suggestions with reference to the proposed new Bill, referred the matter to a committee, which has not yet made its final report, and, in view of the fact that the Bill is for the present withdrawn, the matter is in abeyance.

The Council, after careful and prolonged consideration of the report of the R.I.B.A. committee on registration, decided to proceed with the Society's Registration Bill. Advantage was taken of the general election to send a circular letter and prepaid postcard to every Parliamentary candidate asking him to record his opinion on the principle involved, and his intention or otherwise of supporting the Bill if elected. Many promises of support were received, while only one declared against the principle. The members of the Society were also circularised, asking them to co-operate by communicating with their local Parliamentary candidates, and in many cases this was done with satisfactory results. At the recent International Congress of Architects, Mr. Robert Walker, J.P. (past president), read a paper on "A Statutory Qualification for Architects," and subsequently the following resolution was passed:—"That it is desirable in the interests of the public of all nations and of the profession of architecture that all practitioners should have a statutory qualification." This resolution was immediately communicated to the members of Parliament, and of the Society, with a view of obtaining their co-operation and support to the measure on its second reading. Unfortunately the Bill was not reached, and its further progress has been for the present delayed, but the Council is in a position to say that the Bill has, this session, met with more support from members of the House of Commons than at any other period, and no effort has been or will be spared to secure the object which your Council has in view. It may be of interest to the members to know that a member of the Government, Mr. James Bryce, shortly after his speech at the Society's annual dinner, secured the adoption of a clause in the Irish Labourers' Bill, providing that every person whom a District Council in Ireland proposes to employ as an architect, for the purposes of the Labourers' Act, must satisfy the Local Government Board that he is duly qualified to act in that capacity. This is the first instalment of registration, and every architect will be grateful to Mr. Bryce.

In response to Mr. Belcher's appeal to the profession for financial assistance, the Council contributed 100*l.* from the Society's funds to the Seventh International Congress, towards the cost of entertaining the foreign delegates in this country, and during the Congress papers on the following

subjects were read by members of the Society:—"Steel and Reinforced Concrete Construction," by Mr. Henry Adams; "The Planning and Laying-out of Streets in Cities," by Mr. Raymond Unwin; "A Statutory Qualification for Architects," by Mr. Robert Walker, J.P. The president (Mr. Albert E. Pridmore) and the honorary secretary (Mr. Ellis Marsland) were appointed by the Council to officially represent the Society at the Congress, and a considerable proportion of the members gave their personal support to its proceedings.

One of the features of the year has been the growth and development of the students' section. This is due largely to the institution of the Society's travelling studentship of 25*l.* (which carries with it the Society's silver medal) offered by your Council for annual competition among the students of the Society. The subject for the 1906 competition was a small country house to cost 3,000*l.* The offer was well responded to, twenty-seven sets of drawings being received, with the result that the first travelling studentship competition was won by Mr. Victor H. Grist, of Reading. A special prize of the value of 3*l.* 3*s.*, placed at the disposal of the Council by the president, was awarded to the author of the design placed second; Mr. Alan G. Brace, of Knowle, Warwickshire, and three other competitors, viz. Mr. Geoffrey Morland (Croydon), Mr. Sydney G. Scales (Westcliff-on-Sea) and Mr. Robert O. Jackman (Kingston) received honourable mention. An exhibition of the designs was held for one week on the Society's premises, to which admission was free, and a large number of persons took advantage of the opportunity of seeing the drawings. A further exhibition was subsequently held in the Guildhall, Devonport, under the auspices of Mr. Edgar M. Leest, J.P. (member of the Council), and was an even greater success than was anticipated. The drawings were afterwards exhibited in the Art Gallery at Bath, where Councillor Herbert W. Matthews (member), of that city, undertook the arrangements.

The Council has since approved the work done during the winter's sketching tour, and in accordance with the conditions the balance of the money award, and also the silver medal, will be presented to Mr. Grist at the first ordinary meeting of the session. The Council also instituted an architectural scholarship of the value of 10*l.*, tenable for three years, and open to persons of not more than nineteen years of age, who are desirous of receiving a course of architectural training preparatory to their eventually adopting the profession of an architect. A competitive examination was held in the form of an essay on "Architectural History" and a freehand drawing, for which thirteen candidates presented themselves, the scholarship being awarded to Mr. Harold F. Trew, of Gloucester. Under the new regulations of the Society the students' section will, as before stated, be controlled by a committee elected from among themselves under the chairmanship of a member of the Council, and it is anticipated that the coming session will see a still further extension of this branch of the Society's work.

The Council is glad to find that its action in developing the library by the expenditure of a considerable sum on the purchase of modern technical works has been justified by results. More than 140 members and students have taken advantage of the loan collection during the past session, considerably over 200 books having been borrowed during that period. It is the Council's intention to supplement from time to time the useful collection already in the library. The members and students of the Society were invited to submit designs for a "book plate," a prize of the value of 3*l.* 3*s.* being offered; but though eleven designs were received, the Council did not consider any of them to be suitable for the purpose. Numerous gifts of books and some donations to the library fund have been received during the year, and the Corporation of the City of London has presented the Society with a complete set of commemorative medals struck from time to time during the last seventy-five years. The latter have been framed and placed in the reading-room.

The half-yearly examinations have been held as usual in London and Manchester, Mr. T. Cook, the local honorary secretary, undertaking the arrangements for the latter. Owing to the resignation of Mr. S. M. Wyborn, examiner in Section 1A (planning and design), a vacancy occurred on the Board of Examiners, and Mr. W. A. Scott, A.R.I.B.A., of Dublin, was appointed in his stead. The number of entries has been in excess of any previous year, but the percentage of successes is very low, and no candidate secured more than a pass.

The Council has been in communication with its local honorary secretaries in Bombay and Johannesburg with reference to the formation of branches of the Society in each of those districts, and, while the former is not yet completed, the South African branch has been formed and will be duly constituted at the commencement of the new session.

On March 24 the members of the Council were entertained to luncheon at the Guildhall by Mr. Alexander Ritchie, J.P., the chairman of the City lands committee, and other members of the Corporation. Subsequently the visitors and their host proceeded to the new Sessions House, where they were joined by a large party of members and their friends, who, by kind permission of the authorities, were enabled to view the building under the best possible conditions. On May 5 a party of members paid a visit to the Ilford Crematorium under the guidance of Mr. Albert C. Freeman (member). The annual summer excursion was postponed for this year so that the energies of the Society might be centred upon the International Congress, in view of which the annual dinner was deferred until July 19 in order that members attending the Congress might be enabled to take part in it. The chair was occupied by the president (Mr. Albert E. Pridmore), and a very successful evening resulted, the Society being honoured by the presence of a member of the Government, Mr. James Bryce, Chief Secretary for Ireland, and other distinguished guests.

During the past session papers have been read and discussions held on the following subjects:—Presidential Address; "Cheaper Cottages in Rural Districts," by Mr. J. R. Manning; "The Planning of Crematoria and Columbaria," by Mr. A. C. Freeman; "The Architecture of the Cotswolds," by Mr. Ellis Marsland; "The Painted Rood Screens of East Anglia," by Mr. E. F. Strange; "Shakespeare and Old London," by Mr. T. R. Croger; "Some Recent Law on Sewers and Drains," by Mr. A. P. Poley.

The Council joined in the petition of the Further Strand Improvement committee to the London County Council, with reference to a proposed improvement involving an alteration to the plan as proposed by the latter body, affecting particularly the island site at the foot of Kingsway. The memorial for signature lay at the Society's offices for some time, and the Council subscribed 5*l.* 5*s.* towards the committee's expenses on behalf of the Society.

The Society was represented at the Congress of the Royal Sanitary Institute and the Seventh International Congress of Architects.

The Council appointed Mr. B. R. Tucker (hon. treasurer) to represent the Society on the Council of the Photographic Survey and Record of Surrey in place of Mr. Herbert Knight, resigned. Mr. Albert E. Pridmore (president) will represent the Society at the International Congress on School Hygiene, to be held in London in August 1907.

The employment register continues to be of service to members and students, and the supply always exceeds the demand. Members requiring assistants should bear the register in mind, as a telephone message will bring a number of qualified candidates for the vacant post at short notice. There is no charge to members or students for the use of the register.

Early in the year the Council invested 500*l.* in Consols, bringing up the invested funds to 1,000*l.*, leaving a small sum on deposit. The auditors' report and balance sheet will be presented at the November meeting.

In response to an appeal for support, the Council offered a donation of fifty guineas to the Architects' Benevolent Society conditionally on having proportionate representation on the governing body; but on Mr. Belcher's assurance that the regulations did not admit of such an arrangement, the Council made the donation unconditionally. This was accepted, and subsequently the Council was informed that the Benevolent Society had revised its regulations so as to provide that societies making a donation of not less than fifty guineas should have representation on its Council in the person of their chairman or president for the time being. To mark the termination of his second year of office, the immediate past-president, Mr. Walter W. Thomas, J.P., qualified as a life member by a donation of 10*l.* 10*s.*, made through the Society, and other members also contributed to this most deserving charity. The Council commends the work of the Benevolent Society to notice; in more than one case it has been the means of securing substantial assistance to former members of the Society in time of need.

The Council, recognising the services rendered to the Society for many years by Mr. Walter W. Thomas, unanimously decided to ask his acceptance of the gold medal as

a mark of its and the members' appreciation. The medal was presented at the ordinary meeting in February. It may not be out of place to refer here to the honour which Mr. Thomas received about the same time on his being appointed a Justice of the Peace for the city of Liverpool, which was largely the result of representations made by the Council on a vacancy occurring owing to the death of Colonel Ellison, of Liverpool, the first president of the Society.

Much of the progress of the Society is due to the work done in committee. During the session there have been thirty-two meetings of standing committees, besides a number of special committees, and the work has so greatly increased, and is increasing, that it has been found necessary to make special provision for coping properly with it. Very many questions come before the committees of which the members of the Society hear little or nothing, but which require careful and prolonged consideration, and those who are honoured by being elected to represent you on the governing body are called upon to devote a very large amount of time and trouble in administering its affairs. In submitting this report of the results of its labours during the past session, the Council acknowledges and expresses its appreciation of the co-operation and support without which it would be impossible to carry on the work of the Society.

HERALDRY AS APPLIED TO ARCHITECTURE.*

IT may perhaps be urged that heraldry is now well-nigh an obsolete piece of pedantry. And Alfred Austin, in his poetical drama "Prince Lucifer" (act iv. scene 1), makes that Mephistophelian monarch say—

heraldic blazonries
Are fireworks for the foolish.

Yet, one might remark, his Satanic Majesty may be as over-interested in fireworks as those who look askance at the ancient art of armoury are in utilitarianism. Gray, in elegiac phrase, tells us—

The boast of heraldry, the pomp of pow'r
... lead but to the grave,

and seems to forget that heraldry, if she leads to the grave, very frequently stays there. For through the dignified decoration of sarcophagus tomb and monument with armorial insignia do we to-day possess so many fine examples of old-time heraldic ornamentation and emblazonment.

One could go back to the times of ancient Chaldaea, B.C. 4000, and to the accounts given in the Old Testament regarding the standards and ensigns of Israel, and still probably not then treat of the very earliest beginnings of this antique art. In the writings of Homer, Æschylus, Herodotus, Virgil, Tacitus and others are many references to the armorial bearings of Classic times. And the ancient Britons, the Picts, Scots and Celts doubtless, like the latter-day North American Indians, Maoris and our own aborigines, with their war-paint, tattooing and totems, each carried out their individual ideas of what heraldry originally was. Emblems and devices have world-wide use, and are easily understandable as designed for decorative purposes, or as a means of distinguishing certain persons. Such was assuredly the *raison d'être* of the emblazoned surcoat (from which comes coat-of-arms) worn by the mail-clad warriors of the Middle Ages, who would otherwise have been unknown to friend and foe alike.

To the architect, as well as the artist, archæologist, genealogist, sculptor, painter, engraver, medallist and numismatologist the study of blazonry is essential. And the sculptured monuments and carved shields may often elucidate history and clear up doubtful points. As Parnell says in one of his poems—

The marble tombs that rise on high,
Whose dead in vaulted arches lie,
Whose pillars swell with sculptured stones,
Arms, angels, epitaphs and bones—

are often of the highest artistic and historical value when the tale they tell is rightly comprehended.

The presence of armorial inscriptions on a building has decided complex law cases. There is the incident of an ancient church which formed part of a contested estate, and in searching for evidence of prior possession Lord Eldon had the old plaster—containing the Ten Commandments—chipped away. Underneath was found the coat-of-

* From a paper read by Mr. E. Wilson Dobbs at the Royal Victorian Institute of Architects, and published in the Journal.

arms of an ancestor of one of the parties to the suit, which decided the issue in his favour. And as Lord Eldon said, he was very glad he had broken the Ten Commandments. Then a hatchment placed in front of a mansion may, to the uninitiated in armorial law, be but an unsightly diamond-shaped frame, covered with grotesque figures and scrawls. Yet to one who possesses but an elementary knowledge of the subject a hatchment is full of meaning. It is seen at a glance that it is, say, exhibited by a widow in memory of her deceased husband. The Badge of Ulster, "a red hand on a silver inescutcheon," bespeaks him to have been a baronet; while the well-known motto, "Tria juncta in uno," surrounding the shield, shows he was a Knight of the Bath. The charges on the shield also denote that his wife was an heiress, possibly the daughter of a duke. Thus indeed is heraldry the handmaid of history, a benefit to biography and an aid to art and architecture.

During the reigns of the first three Edwards, comprising what is commonly known as the Decorated period of Gothic architecture, armorial devices were introduced in the principal edifices to a considerable extent. But when the Decorated gave place to the Perpendicular style of Gothic, heraldic devices and shields of arms were employed to a still greater extent, and formed an integral part of the design. Placed alone, held in the hands of saints, or supported by grotesque figures, they form corbeilles and brackets, and are frequently to be found over doorways, in stained-glass windows, over windows, on the spandrels of subellia and arcades, in panels, upon bosses in vaulting, on stone benches, enriching gables, columns and dripstones, and on encaustic floor tiles. On altars and fonts, sepulchral monuments and tombs, shields of arms and other armorial devices are displayed, along with analogous memorials, such as monumental effigies and brasses. In the church vestments also the figurings on the textile fabrics are sometimes purely symbolical and frequently of heraldic import. Cathedral treasuries abound with such work as the badges of their respective donors. About the middle of the thirteenth century Richard, Earl of Cornwall, gave to Exeter Cathedral a beautiful cope, figured with double-headed eagles. There is also the famous Syon cope, which is embellished with forty-five shields of arms, being perhaps the richest specimen of heraldic embroidery of the thirteenth century.

Similar evidences of hereditary dignity were conspicuously displayed on the castles and mansions of the nobility without and within. Gates, walls, windows, battlements and vanes, on each and all were exhibited the devices of their illustrious owners. The palaces of the kings and queens and the Houses of Parliament were also likewise embellished with the royal arms and emblems. In the will of Henry VII., for instance, when referring to his chapel at Westminster, he directs that "the walles, doores, windows, archies and vaults, and ymagies of the same, our chapell within and without be painted, garnished and adorned with our armes, bagies, cognoisants and other convenient painteng, in as goodly and riche maner as such a work requireth, and as to a king's work apperteigneth." The canopies of State, the furniture and plate, the rich tapestry and hangings were all emblazoned with the arms of the royal and lordly families connected therewith. As a modern example of this we have the fine specimens of heraldry as applied to architecture shown by Pugin's artistic and effectively treated armorial details in Barry's design for the present British Houses of Parliament. Views of these are illustrated in H. T. Ryde's work on the Parliament Houses, containing Sir Charles Barry's illustrations, entitled "History of the Palace of Westminster;" in G. W. Eve's "Decorative Heraldry," and in the photographic representations of the Houses of Parliament from the collection made by Sir Benjamin Stone, M.P. As is but fitting, these Houses of Parliament were designed in that Perpendicular style of Gothic architecture with which heraldic art seems so peculiarly associated.

Yet the Renaissance monuments, in common with their predecessors of the Gothic era, abound in every variety of armorial blazonry. The monument of Margaret Beaufort, Duchess of Richmond, in the chapel of Henry VII., of the sixteenth century, with its wealth of heraldic ornamentation, is a fine example of the influence of the Italian Renaissance. The badge-decorated fragment of the monument to Edward VI. in Westminster Abbey, by Torregiano, also shows the same Renaissance feeling. It now forms part of the altar in front of Henry VIII.'s tomb. On the other hand, the ornaments on the tomb of Lady Margaret Lennox, in Westminster Abbey, are of the early seventeenth century

full Renaissance style, being weak in form and wanting in balance. And the worst form of the Renaissance character in heraldry came in at the epoch of the Restoration.

So it is not at all to Gothic alone that heraldic decorations are limited, and fine examples of heraldic monuments are no less abundant than are the shields and other insignia that appear on particular memorials. It is, however, to the architectural enrichments of the cathedrals, and of the stately monuments they contain, we owe the large number of examples of the best kind and of the greatest interest, for the heraldry is always applied there with full regard to its decorative possibilities as well as to its meaning.

The principles which directed the selection of shields to be introduced into the composition of early monuments are worthy of careful consideration, and the same remark is no less applicable in the case of the architecture. Westminster Abbey is one of the richest treasure-houses of such work. Shields of arms of various great personages of the thirteenth century appear in the spandrels of the arches of the nave aisles. Therein also is the beautiful tomb of Queen Eleanor of Castile, the first wife of Edward I., which is an early instance of an application of a series of shields decoratively repeated in the adornment of a monument. The memorial crosses erected to this dear queen's memory between Nottinghamshire and London are also decorated with similar shields. There are also the monuments to Queens Philippa of Hainault, Elizabeth Tudor and Mary Stuart; of Kings Edward III. and Henry VII., and also those of Alianore de Bohun, Duchess of Gloucester, the Countess of Lennox, the Countess of Derby, the two De Valences, Earls of Pembroke, Edmund Earl of Lancaster, Lord Bouchier and Sir Giles Daubeney, K.G. In Canterbury Cathedral the monument of the Black Prince and of Henry IV. and Joanna of Navarre; in Salisbury Cathedral, the monument of Earl William Longespée; in St. Albans Abbey Church, the monuments of Humphrey, Duke of Gloucester, and of the Abbots Wheathampstede and Ramryge; also other fine monuments in the churches at Elsing in Norfolk, Ewelme and Northleigh in Oxfordshire, King's Langley in Hertfordshire, and Cobham in Kent; in Beverley Minster, and in the Beauchamp chapel at Warwick.

Nearly every church in Warwickshire and Leicestershire had a multitude of arms on its windows. Those still remaining in the east windows of Bristol Cathedral are early and good examples of the arms of the great barons Berkeley, Clare and Warren.

Mention should also be made of the fine work that existed in the cathedral of St. Paul, in London, and other great clerical establishments at Peterborough in Northamptonshire, Ely, Norwich, Lincoln, Newark-upon-Trent, Southwell, Kingston-upon-Hull, Selby, Chester, Lichfield and Tamworth.

Then, with regard to variety in composition, at Beverley in the Percy shrine in the Minster, upon a shield of England, the three lions are all of course heraldically the same; but there is nothing of sameness in them, nevertheless, because in each one there is some little variety in the turn of the head or in the placing of the paws or in the sweep of the tail. And again, at Westminster Hall, the favourite badge of Richard II.—namely, a white hart chained and in an attitude of rest—is repeated as many as eighty-three times, and all are equally consistent with heraldic truth and accuracy without any one of them being the exact counterpart of any other. Shields also can be of several forms, and the mode of suspending shields can vary so as to be in accordance with architectural requirements, being shown upright or hanging *couché* or diagonally.

A good example of the characteristic heraldic lion, with attenuated frame, yet full of fierce elasticity, occurs on the finely sculptured shield of Prince John of Eltham, younger brother of Edward III., together with his effigy in alabaster, in Westminster Abbey, dating from A.D. 1336. The lions on the tomb of Edward III. at Westminster are also excellent instances of the splendidly decorative quality of the earlier work of heraldic artists. The chivalric sympathy of Edward III., which impelled him to dedicate Windsor Castle to St. George, and found the most noble Order of the Garter, expressed and fostered the regard for armoury. And the several great seals of King Edward symbolise and show in their ornament and shrinework the development of architectural decoration linked with heraldry.

Then, as showing the decorative value of armorial bearings and badges as architectural ornament, the chantry of Henry V. at Westminster Abbey is a beautiful example, its heraldry forming a large and important part of the design.

With regard to other examples of good work, Champlévé enamels applied to monumental purposes are well represented by the well-known shields of the arms of the sons and daughters of Edward III. on his tomb at Westminster. Those who have studied the enamelled shieldwork of the fourteenth century and recognised the ornamental value of the method there adopted will also gain simplicity and directness in design and in colour or monochromatic effect. There is, besides, the equally familiar shield of William de Valence, Earl of Pembroke—reproduced in colour in Boutell's "Heraldry" and elsewhere—and the casket in South Kensington Museum, said to have belonged to the same Earl William. An actual crest and shield of Edward the Black Prince can be seen among the achievements over his tomb in Canterbury Cathedral, and exhibit excellent work. Then there is the fine example of the lion rampant on the shield of the headless figure in Rheims Cathedral, dated *circa* A.D. 1200. The collection of rubbings at South Kensington Museum from brasses and incised slabs contain many specimens of interest, and quite a lecture could be given on the strange and quaint work done in monumental brasses. And I am glad to learn that a lecture on that special subject will shortly be delivered before this Institute.

While not limited then to that style of architecture, it is still manifest that to Gothic work heraldry is always a consistent, beautiful and most effective accessory. Indeed, so thoroughly is the spirit of heraldry in harmony with the great architecture which grew up in the Middle Ages, that it must be considered rather as an element of its nature than as merely an allied art. Gothic architecture is essentially heraldic, and hence as well from its elastic nature as its equally effective and happy applicability to every use and requirement, heraldry is peculiarly appropriate to that style. For from the earliest years of its existence as a definite art or science, heraldry is found to be most intimately associated with the Gothic architecture of England, and happy it was for the early heralds that in their day the English Gothicists were at work in the full strength of their matured conceptions. And this alliance was never interrupted or permitted to decline from its original cordiality. So long as Gothic flourished heraldry held its own place in architecture. And in the finest works that exist in Great Britain as relics of the grand Gothic ages of English architecture, heraldry is ever present to adorn them with her graphic records. As has been already instanced, in almost every position in which such ornamentation could be admissible the early herald is found to have been the fellow-worker with the early Gothic architect. Gothic architecture accordingly has preserved for us magnificent collections and specimens of the most valuable illustrations of national heraldry. In addition to the fine examples before referred to—and many others that may be mentioned as existent in those splendid ecclesiastical edifices—one must not omit York Cathedral, with the chapel of King's College, Cambridge, as especially rich in heraldic display. The gorgeous chapel too of Henry VII. in Westminster Abbey is an example of decorative heraldry hard indeed to parallel, while Westminster Hall and the northern castles of Alnwick and Warkworth may be specified as containing grand examples of heraldic enrichments. Numerous heraldic encaustic or inlaid tiles of a very interesting character also remain in the cathedrals of Worcester, Gloucester and Exeter, and in the churches of Great Malvern, King's Langley, the Abbey Church of St. Albans and many others. Sometimes the devices are shown reversed on the tiles, evidently the result of the neglect to reverse the design upon the original die or stamps. (In the vestibule of our Federal Parliament Houses, Spring Street, is a fine example of heraldic encaustic tilework.) Unfortunately, in the so-called Reformation days, the Royal Commission of Henry VIII. with great vandalism destroyed many of the armorial insignia in churches bearing the arms of Roman Catholic families. And the fanatical zeal of Cromwell and his followers well-nigh completed the work of spoliation instituted by Henry. Stained-glass windows were ruthlessly broken, altars and screens destroyed, effigies mutilated and monumental brasses stripped for their metal.

Still heraldry had taken too firm a hold of the minds of the higher classes of society to escape the notice of the architects, who have been since engaged by the sovereigns of England and by the wealthy peers and barons and others to erect the palatial structures and stately homes which still exist as the architectural gems of Britain. And a branch of art which our forefathers found so useful as an ornamentation to architecture cannot be beneath the notice of those who are desirous of treading in their footsteps.

Surely at the present day heraldry can be found to be a far more effective means of even interior decoration than the unmeaning Italian and other scrollwork that is so much used. And why should not the arms of different countries be placed on the walls of an exchange as an indication of the various places with which it has dealings than mere conventional ornament? A striking instance of the use of shields of arms of various cities and countries, &c., is contained in the coffered ceiling to the Banking Chamber of the English, Scottish and Australian Bank, Collins Street. Therein twelve shields are tinctured in gold and heraldic colours, and form an effective and appropriate method of ornamentation. There are also some finely-carved shields of arms in the panelled canopy over the bank entrance from Collins Street.

These and other examples that will be noticed in connection with Melbourne architecture are of special interest when one considers that there is a recent revival in the use of heraldry as a decorative adjunct to architecture. For long heraldry has only been approached on the scientific side even in latter-day treatises. And the admittedly artistic side of heraldry has not apparently attracted that amount of attention which the highly effective and ornamental character of the subject might have been expected to secure. In fact, except for short, incidental references in general works on heraldry, and in papers read before certain learned and artistic societies, this decorative aspect has been practically neglected. Heraldry, however, from its origin in the personal adornment of a warrior, through its systematised splendour in the Middle Ages, down to its more modern and chequered existence has, however, been an object of especial interest both as an aid to history and as supplying a strong tone of colour to the times. Its value in decoration, moreover, importing and imparting, as it does, a note of personal historical interest hardly to be had in any other way, can scarcely be over-estimated.

Therefore, it is welcome news to record the remarkable revival which this fascinating subject shares with recent decorative art at large, and how in architectural decoration armoury, which has too often appeared in a small, ineffectual and shamefaced manner—as though it realised its weakness—is again beginning to take the proper prominence to which its value as decoration and its historical interest entitle it. Thus more and more is this heraldic work becoming effective with vigorous drawing, fine modelling and true decorative feeling.

The great change in architectural taste and the Gothic Revival, which took place in the early part of the nineteenth century, revived heraldry. Thomas Willmott, F.S.A., stained-glass artist (1812), was one of the first to re-study the really decorative stained-glass work of earlier periods, his best work being the beautiful glass windows of St. George's Chapel, Windsor, and the armorial window in the Great Hall of Hampton Court Palace. These examples show how well he understood Tudor work, and in his "Regal Heraldry" (published in 1844) the old-time arms and badges with which St. George's Chapel is so profusely decorated are admirably dealt with. Augustus Welby Pugin also assisted *con amore* with his heraldic details for the Houses of Parliament, as before alluded to. The neighbouring chapel of Henry VII. furnished him with the very best material for the designs in question, and the heraldic facts are handled with sincerity, combined with freedom of treatment, high executive ability and artistic excellence. For while following the lines of the Mediaeval method, denoting that the designer had recognised their ornamental value in form as well as spirit, still the more modern mode of application was also aimed at. Thus the resultant effect is characterised by great simplicity and originality.

Pugin's frieze, composed of demi-angels with badges, has served as a model for the embellishment of the lobby of the House of Commons as well as of St. Stephen's Hall. The royal arms on the throne and the arms and badges which form a large portion of the decoration, both within and without, are also very satisfactory examples of the modern use of such forms.

Another noted exponent of heraldic art was Father Dom Anselm Baker, a Cistercian monk of St. Barnard's Abbey, at Charnwood, Leicestershire. His work (of which the best known, though not the best examples, are his illustrations to Foster's "Peerage and Baronetage," 1880-2) vividly illustrates the supremacy of heraldic draughtsmanship that is based on correct ideals. Working with the patient thoroughness of his monkish predecessors, he was not content to copy the mere outline of his art, but succeeded in

infusing the true inner feeling of the earlier artists into a latter-day concept. The whole of his rendering was therefore strikingly in keeping, having true curve of line and tone of colour-tincture, combined into a rich yet subdued composition. He thus showed forcibly how possible it was by sincere effort and loving care to reproduce in the present time some of the best qualities of the early masters of the art.

In architectural design the beauty of heraldic decoration, when introduced as a prominent feature, is nowhere better shown in modern work than in the finely conceived Central Institute of the City and Guilds of London, designed by Mr. Alfred Waterhouse, R.A. There one sees well thought out and admirably modelled armorials fittingly embellishing a broad and dignified façade, forming a handsome example of the use of heraldry as applied to architecture.

Mr. Charles Alban Buckler (Surrey Herald Extraordinary), an architect, has also had executed work in connection with armorial decorations of a very high order. Such examples as those in the modern additions and restorations to Arundel Castle and for the heraldic decoration upon and in Mowbray House on the London estate of the Duke of Norfolk, prove him to be one of England's foremost heraldic artists. In the hall, staircase, gallery and dining-room of Allerton Park, the seat of Lord Mowbray and Stourton, several hundred carved and painted shields appear, modern in decoration and beautiful in design. These are also specimens of the heraldic artwork of Mr. Buckler. And the designs of Mr. Alfred Gilbert, R.A., in the shields forming part of the richly-elaborated monument to His Royal Highness the late Duke of Clarence, are excellent examples of armorial treatment. Then with regard to interior heraldic ornamentation, the British Houses of Parliament present fine examples, as illustrated in the excellent photographic reproductions from the collection of Sir Benjamin Stone, M.P. A great variety of decorative American *motifs* are exhibited in the various splendid apartments of that grand structure.

"The Gilded Chamber" is Gladstone's descriptive phrase springs to the mind as one stands at the bar and surveys the House of Lords. But though the chamber is glowing in gold and colours, the effect is not garish, for the hues of the superb decorations are subdued and harmoniously blended with an artistic effect that is a delight and refreshment to the eye. The solemn stillness and the soft light of a sacred edifice prevail. The figures of the kings and queens of England in the lofty stained-glass windows look like saints in their antique garments. On pedestals between the windows are large bronze statues of knights. At the top of the chamber is the imposing canopied throne. It is magnificently carved, glistening with gold and sparkling with precious stones, and suggests an altar, flanked as it is on each side by costly candelabra of wrought-brass. Formerly there was but one chair of State on this throne; it was designed by Augustus Welby Pugin, the eminent architect who was engaged—under Sir Charles Barry—in the erection and decoration of the new Houses of Parliament. This State chair had been in the House of Lords ever since the Chamber was first used in 1847, and Queen Victoria sat in it whenever she opened Parliament in person. On these occasions the lower chair on the left hand was used by the Prince Consort, and that on the right by the Prince of Wales. But by royal command of King Edward VII. on February 14, 1901, the throne was provided with a second State chair for Queen Alexandra, and for the first time in English history a queen consort accompanied the king in equal state at the opening of Parliament. The new State chair—that on the left of the throne—is almost an exact replica of the old one in design and ornamentation, the only distinctive difference being that it is an inch and a half lower. Both chairs are finely carved, gilt with English gold-leaf, and have the royal arms richly embroidered on the crimson velvet back.

"The Gilded Throne," used at the king's coronation, differs, of course, from those which are situated in other places, such as at the House of Lords and elsewhere. It, however, was very finely designed, and had the king's monogram in the centre of the back, surrounded by the royal and imperial emblems, the rose, shamrock, thistle, lotus and fleur-de-lis, while the royal arms appeared on the curved and carved top of the back part of the throne. The rare Persian carpet beneath the king's throne was also of very beautiful design. It was woven as long ago as 1540 A.D.

The new processional carpet was of dark blue—having been specially manufactured by Webb, of Worcester—of

deep and elastic pile, bearing a design in somewhat darker hue than the ground. This design included the Star of the Garter frequently repeated and an intertwining of the Tudor rose, the thistle and shamrock with the Egyptian lotus, the various spaces being outlined in wreaths of laurel leaves.

LIVERPOOL ARCHITECTURAL SOCIETY.

ON Monday the session of the Liverpool Architectural Society was opened. Mr. Edmund Kirby, in his presidential address, said that nearly twenty years ago that Society honoured him by also electing him president. Having briefly alluded to the Society's position in the old days, he dealt with the developments which had since then taken place in the improvement of the Classical style of architecture, and the influence of Mr. Norman Shaw's work in this direction. The result in the present day had been the erection of many fine buildings in London and the provinces. Among the latter one of the first examples of the Classical style on a large scale in Liverpool was the stately building and the costly offices erected by the Royal Insurance Company. There were also the fine buildings approaching completion, viz. the new Cotton Exchange and the new offices of the Mersey Dock Board. This latter presented a harmonious pile of buildings advantageously surrounded by spacious streets which allowed a full view of the entire groupings to be seen in their best aspects, and with the conspicuous dome centralising the whole composition. As regards the other two large vacant sites at the George's Dock, the northern one of which had lately been sold by the Corporation for the erection of new offices, whilst it was reported that the larger vacant space between it and the dock offices was also to be purchased for building purposes, Mr. Kirby said it was to be hoped that the best architectural efforts would be put forward by the purchasers and the new owners in the development of these schemes to render them worthy of such sites, rare in a great commercial centre, with unique advantages—privileges, he was going to say—for architectural display, with practically unlimited light and air, and great open spaces on every side in which to enjoy the beauties of the buildings they might surround. The opportunity was thus presented of achieving at what might be called the "gate of the city" an effect of architecture which, when completed and in conjunction with the dock offices already erected, would command a frontage to the noble river worthy of rivaling that presented by the quays of Venice. The new dock offices were the result of a design selected through a competition, and finally submitted before adoption to a careful study and revision. He did not know what control, if any, of the plans and elevations had been reserved by the Corporation of Liverpool over the erection of any schemes that might be put forward for the adjoining sites, but he would point out that in similar cases of choice of sites in London the Council of the Royal Institute of British Architects had for several years been asked to advise the Government and also the London County Council upon the designs of new buildings and the laying out of important new routes and street developments, before erections thereon were permitted to be begun. He felt confident that the Council of the Liverpool Architectural Society had men in its body to whom the City Council could, similarly to London, refer such questions of design, and with the same excellent results. In the last twenty years changes had been so numerous in Castle Street that it might be said to be nearly rebuilt. With the town hall as the end of the vista of view looking north, he knew no commercial street, even in the City of London, comparable with its appropriate and complete architectural effect. Having referred to the erection in an up-to-date style of branch banks, free libraries and schools, the great tobacco warehouse, the grain warehouses at the South end, and the new Corporation small-pox hospital at Fazakerley, which from the reports on all sides seemed to be the best hospital in the country, Mr. Kirby said he rejoiced that the new cathedral was rapidly being pushed on, and its progress would be watched with the keenest interest in the development of its fine and original design. He then gave an account of the International Congress of Architects, held in London in July last, at which one of the subjects discussed was municipal work and the housing of the working classes. In Germany much care and thought had been devoted to laying out the suburbs for workmen's dwellings; the new streets leading to them were contrived with a view to

spaciousness, for light and air, and were ample enough in width to allow for the free passage of tramways leading speedily to and from the business centres without disturbing the ordinary traffic. Liverpool was sadly backward in this movement. The medical officer had lately made some strong reports and some drastic orders were in progress for the sweeping away of some of the worst dwellings of the poor, but before these were carried into effect it was imperative that the great suburban schemes above shadowed forth should be immediately taken up by local authorities, bearing in mind in the disposition of the improvements not only the actual housing of the poor, but their easy and rapid transit by tramways or the overhead railway to and from the principal centres of labour. Whatever was done he trusted that cottage houses (preferably with small gardens) might be adopted in preference to the "flat" system, the cottage houses being more wholesome and healthier than high "flatted" houses. The subject of "Official or Municipal Architecture" was also one of the subjects dealt with at the Congress, this having been brought into prominence by the growing tendency of municipal bodies not only in England, but in many other countries, to give the designing of purely architectural works to their own officers. Lately architects in various towns had protested against the practice as being an injury to their livelihood and the art of true architecture. Clever as they might be, town surveyors were not generally born or trained as architects. Many corporations nevertheless spent large sums on art in various forms to train both the public and professional men in technical schools, schools of art, and in Liverpool especially at the art and architectural schools of the University. It stood to reason, therefore, that the natural development of this expenditure on this educational movement was in the employment of local talent. It was not fair to expect from salaried officials that they should render to corporations services of a high-class order equal or comparable to those of the first-class and trained architects.

Mr. P. C. Thicknesse proposed a vote of thanks to the President.

Mr. Grayson, in seconding, emphasised the importance of the authorities consulting with the Institute or profession in cases where, like that of George's Dock, they would have buildings springing up which might or might not be in harmony with the one now erected there.

Professor Riley, in supporting the vote, agreed with this view, adding that there was a magnificent opportunity afforded at the George's Dock.

Mr. E. P. Hinde remarked that whilst there appeared to be an endeavour to improve the town in the slum districts, no steps seemed to be taken for laying out the suburbs in a proper manner.

Mr. W. E. Willink congratulated the Society upon again having Mr. Kirby as president.

The motion was carried with acclamation.

MODERN VANDALISM.

A PARTY of members of the Sussex Archæological Society visited Chichester on Monday. The cathedral was described by Mr. E. S. Prior, M.A. In the course of his remarks he pointed out the dangers that threaten fine monuments of art in our churches and cathedrals from unscrupulous American visitors. He told his hearers that he was recently at Christchurch, photographing some fine carving in the church, and noticed that one of the best portions of the carving had been ruthlessly cut and hacked about since his previous visit, a few months earlier. When he called attention to this, the vergers told him that a party of ten Americans had recently visited the church, and that while six of them had held him in conversation at the other end of the building the rest had occupied themselves with cutting pieces from the carving—presumably to take away as mementoes. Since he had lived at Chichester he had himself noticed six distinct chips which had been knocked off the beautiful figure on the tomb of Lady Maud Fitz-Alan, one of the most beautiful monuments of its kind in the country. We kept the statues of Greece and Rome in our museums, said Mr. Prior, and visit any damage committed to them with severe penalties, but statues which are quite as valuable, as being the best art, and should be more so, as being English, we are content to leave at the mercy of the vulgar curiosity or the carelessness of the public.

Mr. P. M. Johnstone read a paper on church chests. Mr. W. V. Crake afterwards, at Priory Park, read a paper on

the history of the building and site of the Guildhall. The mayor (Alderman W. L. Gibbing), in referring to the work of repairing the roof, which the City Council had put in hand, said a great deal of money might no doubt be spent with advantage on the building, but money was scarce in the city, and although they recognised their responsibility for keeping the building in a state of repair and preventing it from falling into ruin, he was afraid if very much more was found to be desirable they would have to depend to a great extent on outside help from those who were interested in archæological matters.

GLASTONBURY ABBEY.

WE understand, says the *Guardian*, that the famous ruins of Glastonbury Abbey will shortly be for sale. We are informed, indeed, that an offer of purchase has already been received from America and refused. It would be extremely regrettable if these thrice-famous ruins were allowed to pass either into foreign hands or into the possession of some owner who would fail to realise his responsibilities. Glastonbury is inseparably connected with the legends of the Sangreal and the Holy Thorn. There in Arthur's Avalon stood from early British days down to the Reformation a Christian church, and there, as in a national Pantheon, were continuously buried kings and heroes innumerable, until the day when its last abbot was judicially murdered at the bidding of King Henry VIII. and the great monastery broken up. Now that Tintern has become a national possession, a precedent has been set which can hardly be ignored. What remains of Glastonbury Abbey may lack the scenic attractions of the ancient foundation among the hills by the Wye, but there is certainly no monastic building in England which can vie with it in architectural splendour or august association.

PARNELL STATUE, DUBLIN.

THE artistic work connected with the Parnell monument is now practically complete. That work has been greatly delayed by many unforeseen circumstances, among others by a fire which took place at the studio of the artist, Mr. St. Gauden, in America. He is under contract to complete the work in the year 1906, and has practically done so. His model of the central figure of the monument of Mr. Parnell is at present on its way to Italy to be cast in bronze, and with certain trifling exceptions the other ornamental work of the monument has also been completed. Tenders have been received from Irish firms for the erection of the monument. It is hoped that the contract for this portion of the work may be entered into very shortly, and that operations may immediately commence. Satisfactory arrangements have been made with the Dublin Tramway Company so to alter their lines outside the Rotunda as to suit the dimensions of the base of the monument, and it is hoped that the actual work of the architectural portion may be entered on very speedily.

The design consists of a slightly tapered triangular shaft standing on a circular platform 26 feet in diameter. The width of the base will be 13 feet, and the total length from the ground to the top of the tripod, which will surmount the shaft, will be 65 feet. In the pavement of the circular platform is represented in green granite a large conventionalised outline of the shamrock, within which is symmetrically placed the triangular shaft. Around the carved base the counties and provinces of Ireland are represented—the former by thirty-two bronze panels or tablets, surrounded by an inlaid bronze ornament of shamrocks, and the latter by four bronze laurel wreaths on the face of the pedestal which carries the statue of Parnell. On the angles of the base are inserted large bronze torches. Since the statue of Parnell is the most important part of the monument, it is necessary that the shaft should form such a background as will least detract the eye from the statue itself, and the plain surface against which the statue will be outlined on the proposed form of shaft will attain this.

In front of the shaft on an extension of the base, as a pedestal, will stand a bronze statue of Parnell, 8 feet in height. The attitude of the figure is striking—the facial resemblance is perfect, and great care has been taken to render all the minor details faithful to the surroundings of the chief in life. On the face of the shaft, just over the head of the figure, a large harp is incised, and also an inscription, including the following extract from the famous speech delivered at Cork on January 21, 1885:—

"No man has a right to fix the boundary of the march of a nation. No man has a right to say, 'Thus far shalt thou go and no further.' We have never attempted to fix the ne plus ultra to the progress of Ireland's nationhood and we never shall."

From this up the shaft remains perfectly plain, finishing, however, with a carved finial, surmounted by an immense bronze tripod flamboyant. The only other inscriptions are the word "Parnell" in large bronze lettering near the top of the shaft, and the words in Irish letters, "God save Ireland of the Clans."

ART COMPETITIONS.

THE following candidates were successful in the competitions for Royal Exhibitions (Art), Local Scholarships (Art), and for National Scholarships (Art) and Free Studentships (Art), 1906.

ROYAL EXHIBITIONS.—John D. Revel, Preston; William J. Watts, Liverpool; George H. J. Day, Chester; Percy Gleaves, Burslem; Richard Wallwork, Manchester; Frank C. Stone, Rochester; William O. Miller and Douglas S. Andrews, Brighton; Alan W. Bellis, Leeds; Percival Moore, Keighley.

LOCAL SCHOLARSHIPS.—George A. Lowis, Nottingham; Ernest Hartley, Rochdale; William H. Rogers, Birkenhead and Liverpool; Edward Ridley, Birmingham (Municipal); Lucy Wakefield, Maidstone; Grace D. Harold, Brighton; George J. Cox, Cheltenham; Leslie G. Brockhurst, Birmingham (Municipal); Alexander S. Hill, Royal Institution, Edinburgh; William F. Chandler, Bath; William MacBride, Belfast; George F. Quarumby, Holmfirth and Huddersfield; Benjamin Hancock, Birmingham (Municipal); John H. Molyneux, Carlisle; Ruby Sheffield, Poole Hill, Bournemouth; Adam B. Thomson, Royal Institution, Edinburgh; *Arthur Scott, Burslem; Frederick C. Herrick, The Newarke, Leicester; Raymond Jones, Ashton-under-Lyne; Harold Rhodes, Bradford; Frederick S. Smith, West Bromwich; John F. Bohs, Poole; *William Hill, Bradford; John W. Chester, Burnley.

* These candidates declined the scholarship, and the vacancies thus caused have been filled by the appointment of other qualified competitors.

NATIONAL SCHOLARSHIPS.—William T. Benslyn, architectural pupil, Birmingham (Municipal); Charles L. J. Doman, monumental sculptor, Nottingham; George Ruston, modeller, West Bromwich; Sidney Tushingham, china painter, Burslem; Frederick P. Brown, decorative artist and designer, Rochester; Tom Whitehead, textile designer, Halifax.

FREE STUDENTSHIPS.—John Smiley, Belfast; James F. Flanagan, Macclesfield; Walter Ashworth, Rochdale; John P. Clark, West Bromwich; James T. Niven, Sheffield; Dorothy M. Dyer, Clapham high school, London; Noel H. Leaver, Burnley; Sydney J. Pearson, Leeds; Edith A. Camp, Chelsea, London; Lucy E. B. Mackenzie, Elgin; Harold Gardner, Beckenham; Annie C. Acheson, Belfast.

TESSERÆ

Subject in Painting.

IT is not in the subject, but in the manner of treating it, that the man of true genius shows his capacity, be he painter or poet. The most captivating pictures of the Flemish and Dutch old masters are not unfrequently nothing more, as to subject, than the simple basse-cour behind their own domicile. Girtin was a Londoner, so was Turner. Varley was of the same great smoky town. These, deeply imbued with the love of art, and knowing that the real objects of nature and art were the proper subjects for their imitation, wandered not far from home in search of the picturesque—no, they used their eyes, and exploring the shores of the Thames between Blackwall and Battersea, found subjects enough worthy of being painted to supply material for new subjects, with all their multifold, yea, exhaustless combinations, ever changing as they are, to last, if the things themselves were durable, for a thousand years. A fastidious young painter of portraits, whose parents provided him with more money to purchase canvases and paints than nature had supplied him with talent to use them, calling with his father on Sir Joshua Reynolds, who was his countryman and friend—the good gentleman, on submitting a specimen of his son's work, a bust likeness, was astounded at the great man's not thinking quite so highly of it as himself. The tyro, who was not wanting in

self-conceit, expecting praise rather than advice, pertly observed, "You, Sir Joshua, can command your subject; whilst a young man like myself must paint from what I can get." "No, sir," mildly replied Sir Joshua, "I cannot command: you have had nature for your prototype, I suppose, and I always found that enough. It is neither your business nor mine to be fastidious—imitate what you find in your model and the fault will be yours, and not your prototype's, if you do not produce a good picture." To assert that one subject may not be very preferable to another as to its general characteristics for a picture would be nonsensical. It may, however, be safely asserted that taste and judgment, without which neither painter nor poet will ever do credit to his craft, will lead to the development of qualities in almost every object in nature, sufficient, if well applied, to constitute not only a picture but a picture "delectable to behold." It is not with pigments, oils and varnishes alone that a picture is wrought. Reynolds, Titian, Rembrandt and Wilson mixed their colours with genius, and painted not only with their brushes but with mind.

Eginetic Sculpture.

This school is dominated from the figures found at Ægina. The muscles and the veins, which are anatomically correct, exhibit the soft flexibility of life, and even motion of the body, in scientific harmony with nature. The limbs are strong, though not Herculean, and elegant without effeminacy. No preposterous muscular protuberance, no unnatural feminine delicacy offends the eye. They are natural without being harsh or rugged, and are composed with Doric severity, mingled with the airy grace of the youthful form. The perfection of the finish is quite wonderful. Every part is in a style worthy of the most beautiful cameo. The extremities of the hands and feet merit more particular admiration. Indeed, the ancients thought that elegant fingers and nails were essential ingredients in the composition of the beautiful. The most extraordinary circumstance, however, in these statues is the want of expression and the sameness of countenance, which is to be observed in all the heads. This approximation to identity is certainly not fortuitous, for the artists who were able to throw so much varied beauty into the forms of the bodies were no doubt able to infuse a similar diversity of expression into the features. Their talents were probably confined to one style of countenance by some religious prejudice. Perhaps some archaic and much venerated statue served as a model, from which it might not have been consistent with the feeling of reverence or with the state of opinion to deviate. The formation and postures of the bodies offered a greater scope and a wider field for the talents of the sculptor; for while the Doric severity of the early Eginetic school is evidently diffused through the whole, yet a correctness of muscular knowledge and a strict adherence to natural beauty are conspicuously blended in every statue. An unmeaning and inanimate smile is prevalent in all the faces. Even one of the heroes, who is mortally wounded, is supporting himself in the most beautiful attitudes and smiling upon death. In short, the conqueror and the conquered, the dying and the dead, have all one expression, or rather none at all. The high finish of the hair is particularly worthy of notice. Some of the curls, which hang down in short ringlets, are of lead, and still remain. The helmets were ornamented with metallic accessories, and the offensive weapons were probably of bronze, but they have not been found. All the figures have been painted. The colour is still visible, though nearly effaced. The statues are in the museum of Munich. Pausanias mentions the Eginetic school of sculpture.

The Greek Stage.

The theatres of the Greeks were not intended, as ours are, for performances during several consecutive months, but were open only for a short time at the seasons appointed for religious festivals, when the capitals were crowded with a population gathered from a wide circuit. The word "theatre" is associated in our minds with night, and gaslight, and heated houses; but the acting of a play in Greece took place under very different circumstances. The performance was invariably by day, and their theatres had no roof, so that the spectators sat beneath the open sky. It was thought improper for women to appear on the stage, and female characters were therefore personated by men, as they were in England in the time of our early dramatists. A great concourse of people was the natural consequence of the particular period, and of the shortness of the time during which the theatres were open, and thus

it was necessary to build them on a vast scale. Some were large enough to hold 15,000 or 16,000 people. In this fact we may discover some justification for certain peculiarities of costume that would not be tolerated amongst ourselves, because they would remove one source of pleasure with which theatrical amusements are witnessed. The actors were raised above the ordinary height by means of the cothurnus, or buskin, and their faces were concealed by carved and painted masks. From the great size of the building the spectators were too far removed from the stage to enable them to read on the actor's countenance that language of feeling and passion which speaks so powerfully, even when the tongue is silent. "And how did Garrick speak the soliloquy last night?" "Oh, against all rule, my lord; most ungrammatically. Betwixt the substantive and the adjective, which should agree together in number, case and gender, he made a breach thus—stopping as if the point wanted settling; and between the nominative case, which your lordship knows should govern the verb, he suspended his voice in the epilogue a dozen times, three seconds and three-fifths by a stop-watch each time." "Admirable grammarian! But, in suspending his voice, was the sense suspended likewise? Did no expression of attitude or countenance fill up the chasm? Was the eye silent? Did you narrowly look?" "I looked only at the stop-watch, my lord." "Excellent observer!" The critic's conduct, at which Sterne rightly dealt his sarcasm, would not have been so egregiously out of place in a Greek theatre. The masks were so fashioned as to indicate with more or less distinctness the person represented; and if they concealed the workings of emotion, the contrasting differences and nice transitions of expression, they helped to idealise the actor, and so far carried out the Greek notion of tragedy. Even the reader who never entered a theatre may conceive that the occasions are innumerable in which an actor, by his countenance, can add a most expressive commentary to his words, and at another time can hint a thousand words when he does not utter one. Yet all this kind of acting, and the pleasure derived from its successful accomplishment, the Greeks deliberately denied themselves by the use of masks. At the same time, it should not be forgotten that they were contrived with a view to increase the power of the voice, and that they were embellished to a high degree by the united efforts of the first sculptors and painters.

GENERAL.

Herr Max Rabes has completed three large wall-paintings for the foyer of the new theatre at Breslau. The subjects are the "Drama," "Opera" and "Operetta."

Mr. Sturge, one of the members of the London County Council, has given notice of a motion "that it be referred to the general purposes committee to consider and report as to whether the Council should, by application to the College of Arms or otherwise, take steps to obtain a coat-of-arms, with a view to commemorating worthily its work in connection with public improvements, such as the construction of new streets and bridges, the restoration of ancient buildings and the like."

Mr. G. A. Hill, of Albert Chambers, Manchester, has been appointed arbitrator on behalf of the Bolton Corporation in the claim by Sir Wm. Hulton for 143,554*l.* in respect of lands in Turton and Belmont required by the Corporation under the 1905 Act, and in the claim of Mr. Edward Deakin for 50,000*l.* for other lands in Turton.

A Memorial to the officers and men belonging to the Royal Irish Fusiliers who died in South Africa has been unveiled at Armagh. It consists of a bronze figure of a trumpeter of the regiment, and is named "The Last Post." The figure stands about 7 feet high, and is erected on a granite base with a pedestal 12 feet high. On the front face of the pedestal is a bronze badge of the regiment, giving the list of engagements. The other three sides contain the names of the officers and men. The bronze figure weighs 12 cwt., and was designed and modelled by an Irish lady artist, Miss Kathleen M. Shaw.

The New Fresco Painting entitled "Modern Commerce," which will form a companion picture to "Ancient Commerce" (by the late Lord Leighton), will be received on the 22nd inst. by the Lord Mayor. Mr. T. L. Devitt, the shipowner, is the donor of the picture, which has been painted by Mr. Frank Brangwyn, A.R.A.

A Paper on "Old English Customs and Folk Lore" will be read by Mr. P. Cowell at the meeting of the Liverpool Architectural Society on Monday next.

Mr. Edwin Ward, one of the assistants of the Royal Scottish Museum, is to accompany Professor Flinders Petrie to a district some 200 miles south of Cairo, where they will spend about four months in camp. Mr. Ward will assist in directing the operations of a regiment of Arab diggers and carriers, who will clear away the sand and *débris*, and, it is hoped, will bring to light a number of ancient tombs containing examples of Egyptian art.

The Newman Memorial Church, Birmingham, was opened on the 9th inst. The church has been designed upon the model of San Martino in Rome, in accordance with the wishes of the cardinal himself. He caused the exact ground plan and elevation of San Martino to be made for him in 1850.

The Works Committee of Ayr Town Council have resolved to recommend that the request of the Auld Brig preservation committee for an extension of time be granted until March 31, 1907.

Mr. Deputy C. T. Harris has presented to the Guildhall Art Gallery a picture by the late Mr. Frederick Goodall, R.A., entitled *Early Morning in the Wilderness of Shur*.

A Design for a new tympanum for the west door of the famous old parish church of St. Bees is to be submitted for the approval of the chancellor of the diocese at the Consistory Court which is to be held at Carlisle on the 16th inst. The design has been prepared at the request of a lady resident, who has also undertaken to restore the missing pillars in the stonework of the beautiful Norman doorway, and to repoint the arch. The west front of the church dates from the eleventh century.

The Belgian Government has sent its thanks to Mr. Pollock, ex-mayor of Birmingham, for the picture by the Belgian artist Stevens, which he has presented to the Belgian Museum.

The Society for the Protection of Ancient Buildings have consented to restore an old cottage in the churchyard of Theydon Garnon, Essex. The cottage dates many centuries back.

The First Ordinary General Meeting of the Surveyors' Institute will be held on Monday, November 12, when the president, Mr. George Langridge, will deliver an opening address. The portrait of Mr. Julian C. Rogers, the late secretary, will be unveiled. The Council have decided to award a gold medal for the best paper, if of sufficient merit, read during the session.

The Waterworks Committee of the Coventry City Council have decided to invite Professor Lapworth, of Birmingham University, to report upon the geological features of the site at Weston-under-Weatherley, where it is proposed to bore for water in order to increase the city's supply.

The Cape Cod Pilgrim Memorial Association, U.S.A., offered five prizes of 200 dols. each to be awarded to competitors submitting to them designs for a monument to be erected at Province Town, Mass., to commemorate the Landing of the Pilgrims and the Signing of the Compact. The monument is to be of granite, not less than 250 feet in height, built upon a hill of sand formation about 90 feet above sea-level and to cost 80,000 dols. It is to have an inclined walk (no steps) of concrete from bottom to top of interior.

The Birmingham baths and parks committee report that satisfactory progress is being made with the sinking of the artesian well for the supply of the proposed baths at the corner of the Aston Church Road and Nechells Park Road. The present depth of the well and borehole is 250 feet. It is intended to erect a building which shall comprise one large swimming bath and a suite of private baths for men and women. The committee have decided to ask the Council for permission to make applications to architects to send in competitive plans with a view to secure tenders for the erection of the baths.

A Consular Report issued from Washington states that both Great Britain and the United States are rapidly increasing their foreign sales of machinery. American statistics for the fiscal year ended June 30, 1906, show 18½ per cent. increase over 1904, while the British figures of export for those months show 24½ per cent. increase over the same months of 1904. South American markets proved the best field for British locomotive expansion, the sales there increasing from 157,000*l.* for the first half of 1904 to 636,000*l.* for the first half of 1906, being 50 per cent. of Great Britain's sales of locomotives this year up to June 30. The South American sales of British stationary engines advanced from 100,000*l.* in the first half of 1904 to 240,000*l.* for the first half of 1906.

The Architect.

THE WEEK.

THE late Sir RICHARD TANGYE, who died on Sunday, deserved to be taken for a typical Birmingham citizen. Yet, like many other men whose names will always be associated with the city, he was not a native, for he was born in Cornwall in 1833. He was known as the head of a firm that manufactured machinery. But he was engaged in other pursuits prior to undertaking that work. Fortunately for him he had two brothers who were acquainted with practical mechanics, and in consequence their productions always answered the purpose for which they were intended. They became known for hydraulic jacks which were used for lifting heavy weights. BRUNEL was in a difficulty with his colossal *Great Eastern* steamer. The vessel was too big and too heavy to slide gracefully into the river at Millwall. He therefore resolved to try the experiment of using jacks, not for lifting the mass, but for gently propelling it. In that way the fame of the firm became established. More general use was made of their improved differential pulley-block, with which most builders are acquainted. The business increased and the firm became one of the best known in Birmingham. More than two thousand men were employed in the works. In 1881 TANGYES, LTD., was constituted. It is absolutely necessary for anyone who wishes to stand well in Birmingham to take a share in municipal government. For a few years RICHARD TANGYE was one of the most useful members of the Council. He and one of his brothers, Mr. GEORGE TANGYE, may be said to be the founders of the Art Galleries and School of Art, for they gave 10,000*l.* towards the establishment of those institutions. Afterwards they contributed 11,000*l.* in addition. They also presented valuable works of art. Sir RICHARD TANGYE was the author of "Reminiscences of Travel" and "One and All," two interesting books. His name will long be remembered as one of the worthies of Birmingham on account of the example he set as a citizen as well as for his benefactions.

THE President of the Architectural Association in his address took care to refer to the Rifle Club of the Association. "One would imagine," said Mr. BALFOUR, "marksmanship should be a strong point with a body of men who, like ourselves, require an accurate eye, a steady hand, and who deal so much in straight lines. As to the patriotic point of view I need not speak." The rifle section has practice on Thursday evenings at the headquarters of the London Scottish, 59 Buckingham Gate. Although so lately formed a great many members have joined. The rifle club will be inaugurated at 3.30 P.M. on the 27th inst. by Major-General Lord CHEYLESMORE, C.V.O. It is to be hoped that the Association will be well represented on so important an occasion, when the members can demonstrate that they also are inspired by a spirit of defence. The honorary secretary and treasurer is Mr. J. H. SQUIRE, 69 Palace Court, W., who will be glad to attend to any communications made to him.

WHEN the London Building Acts came before Parliament last year for amendment all the parts were withdrawn with the exception of Part 8, which related to fires in buildings. It was anticipated that the parts withdrawn would be amended according to the suggestions of the Metropolitan Borough Councils and other authorities. But the Building Act committee have not been able to report in time for a Bill to be drawn. They say, however, that "there are two matters with regard to which we think that an amendment of the law

should be sought without further delay. These are the constitution of the Tribunal of Appeal and the method of remuneration of district surveyors. These two matters can be conveniently dealt with, apart from the others which require attention, and if a satisfactory amendment of the law in these two respects can be secured it will greatly facilitate the work of formulating proposals with regard to the other necessary amendments. An additional reason for urgency exists in the fact that a considerable number of district surveyors' districts are vacant at the present time, and it is desirable that the temporary arrangements made for the supervision of these districts in view of the possibility of securing at an early date legislation with regard to the mode of payment of district surveyors should be terminated as soon as possible." It may, therefore, be assumed that an application will be made for an amendment of the Building Acts to that extent. There will probably be opposition from officials affected by the arrangements. It will, of course, be assumed that the Tribunal of Appeal have incurred the displeasure of the Council by seeking an increase in their fees and by allowing costs to an appellant against the Council.

THE district lying between Clerkenwell and Holborn, where the poorer Italians most do congregate, is one of the parts of the Metropolis where sanitation continues to be almost disregarded. The foreign population look on London as only a temporary place of sojourn. They are miserly and they come from a country where godliness is not supposed to be allied to cleanliness. Most of the inhabitants spend the days in the open air perambulating the streets with organs or other means for obtaining money. On their return, if the evenings are fine, they prefer the streets to their noisome dwellings, and in consequence the death-rate is not as high as might be imagined. The density of population is more than four times that of the remainder of the Holborn borough. But in spite of overcrowding and other sanitary defects the Italians appear more healthy than the inhabitants of some of the districts in the East End. On Monday the adjourned inquiry of the Local Government Board was resumed. But it did not last long. Counsel for the Holborn Town Council said that all the owners of property in the district with one exception had agreed upon a partial scheme of improvement. Some houses will be demolished. Henceforth underground rooms will only be used as kitchens or as stores. The tenants occupying them received notices, and nearly all have left. The Chandos Land and Building Company, who own most of the houses, expect to complete the alterations and repairs to their property before Christmas. It was therefore decided to again adjourn the inquiry until April, when it could be ascertained whether a more extensive transformation of the area would be necessary.

EXCAVATIONS are in progress at Alise-Sainte-Reine, not far from Dijon, which is supposed by some investigators to be the site of Alesia, where VERGINGETORIX made his last stand. There is no doubt the village must have been occupied by Romans, for there was lately found a statuette of MERCURY, a bust of SILENUS, and other examples of ancient metalwork. The SILENUS is a remarkable work, and could only have been modelled by an ancient sculptor. The beard has been elaborately treated. A branch of ivy is round the head, and the eyes seem to have been encrusted with silver. After the departure of the Romans the inhabitants were unable to appreciate the beauty of the bust; a ring was soldered to the head, and the bronze was utilised as a weight for heavy articles. Henceforth the bust will, of course, find a place in one of the museums.

HOLYROOD ABBEY.

IT would be interesting to know what unbiassed people in Edinburgh must think about the adverse opinions which have been expressed concerning the restoration of Holyrood Abbey. The late Lord LEVEN AND MELVILLE, it will be remembered, bequeathed 40,000*l.* for the work, on the understanding that it was to be carried out from the plans of Mr. THOMAS ROSS, architect, one of the authors of a fine work on Scottish churches. It is always easy to find arguments against restoration. And yet we suppose there is not an architect in Edinburgh who would not attempt a restoration of the chapel if the commission were offered to him. Few of them probably would adopt the formula of the English restorer, who used to say that for years he was dreaming of whatever undertaking was proposed to him, and that it would be the crowning effort of his life. But we may be sure that good reasons would be found for accepting the responsibility.

Lord LEVEN was desirous of a restoration in order that a chapel might be provided for the Knights of the Order of the Thistle. But it is not unlikely that he was also urged to bequeath the money by the remarks which he heard upon the desolation of the ruins from Englishmen and foreigners. The approach to Holyrood through the Canongate may, in spite of all the influences of romance, raise doubts about the greatness of Edinburgh at a former time. One decayed house after another can be pointed out as belonging to some of the Scottish nobles. Various causes can be brought forward to explain the decline of the habitations. But the palace as a royal residence still retains a certain amount of grandeur. It cannot, of course, be compared with similar buildings in other countries. But when all that history relates concerning it is considered, the "princely bower" becomes an impressive building.

When, however, the visitor sees the adjoining ruins their condition must strike him as the most melancholy of such spectacles. All that can be said about the havoc caused by invasion and by the vandalism of the Edinburgh mob cannot explain sufficiently the desolation, which seems to be increased from the position of the building. No doubt there has been a great change in the religion of Scotland, and in consequence in the North, as well as in England, several beautiful examples of architecture have suffered. But it is only natural to assume that the rulers who possessed, if they did not always use, the palace would have taken steps for the preservation from the elements of an abbey which was connected so closely with the Scottish kings and with the national history. In the seventeenth century, it is true, the Barons of Exchequer ordered the ruins to be covered. But heavy freestone was employed, and sufficient allowance was not made for the weakness of the walls which had to support the masonry. In the course of a couple of years the roof collapsed, and caused great destruction of the ornamental details. No second attempt was made for the protection of the chapel.

The origin of the abbey is indicated by the name, which unites the Edinburgh church with several others in Europe. Many are acquainted with the story of St. HUBERT, the huntsman, who encountered a hart bearing a crucifix between its antlers. About the year 1128 the Scottish king DAVID I., when hunting, was attacked by a stag, and was in danger of death, when a cross was suddenly interposed, at the sight of which the animal fled. Out of gratitude DAVID resolved to found a church dedicated to the Holy Rood, which he endowed and placed in the charge of the Augustinian canons. In addition, many other privileges were granted to them. And indeed there was some reason for one of the kings describing DAVID as "an sair sanct for the crown." They were allowed the right to make a separate burgh or district

around the abbey. Many Edinburgh gentlemen were glad to escape from their creditors to the monks' district. Sir WALTER SCOTT at one time anticipated that he would have to seek refuge there, and THOMAS DE QUINCEY was quite familiar with it. It is well to remember that the abbey existed long prior to the palace. Some of the kings preferred the monastery to the castle as a residence. It is doubtful whether a separate dwelling for royalty was erected previous to the reign of JAMES IV. The building was connected with the abbey church by a cloister.

The abbey probably became the richest of all those in Scotland. On that account it was doomed to suffer whenever an English invasion occurred. In 1544 the monastery was destroyed but the church was spared. What is now known as the chapel of Holyrood is, however, really only the nave of the ancient abbey church. But whether that arose from the burnings by the English or through neglect it is now difficult to determine. In 1569 a bishop was charged with such neglect of the building that it was dangerous to enter it. His defence was that for twenty years the chapel was falling into a ruin, and that 2,000*l.* would not be sufficient for reparation. He proposed that the choir and transepts should be demolished and the materials sold to provide money for building a parish church for the Canongate.

The monastery, like others, was suppressed at the time of the Reformation. The ROXBURGH family obtained possession of property and privileges which they held until 1636, when the Corporation of Edinburgh obtained the rights over the Canongate and deprived it of its independent jurisdiction. JAMES I., when he ascended the throne of England, neglected Holyrood; but he revisited it in 1617, and in spite of its decay service was held in the chapel in the English manner, which offended Scotland. During the Civil War the palace was destroyed by fire and injury done to the chapel. CROMWELL gave orders for the rebuilding of the palace. But CHARLES ordered that the part built by the "Usurper" should be taken down. The Merry Monarch and JAMES II. gave as much attention to the new works as if they expected that sooner or later the palace would serve as a permanent residence for them.

JAMES II. created the Noble Order of the Thistle, and he desired that Holyrood Chapel should be used by the knights. The inhabitants of the Canongate were ordered to worship elsewhere. Carved stalls were introduced for the knights, a college of priests was also established, and daily services according to Roman rites could be seen in the chapel. This caused great dissatisfaction among the populace. When the news arrived of the flight of JAMES and the arrival of the Prince of ORANGE, an attack was made on the building. Some defence was offered, but finally the insurgents prevailed. They destroyed the new stalls and the costly fittings which JAMES had introduced. They even broke open the tombs, and the remains of kings and nobles were thrown about. Then came the attempt to roof the chapel, which, as we have said, only increased its ruin.

Afterwards the palace was long disused, and the local prejudices against the chapel were unfavourable to outlay on restoration. The palace was inhabited for a time by the Pretender. At the time of the French Revolution the Comte d'ARTOIS, who was afterwards known as CHARLES X., spent three years at Holyrood, and when the revolution of 1830 broke out he again returned to it. When it became known that GEORGE IV. was about to visit Scotland some of the Scottish peers and other gentlemen considered proposals for repairing and re-establishing the chapel for the king's use. But the desire was never approved. The late Lord LEVEN AND MELVILLE has therefore by his bequest endeavoured to have realised a project which should have been accomplished some eighty years ago. We hope that this time his aspiration will not be in vain. The parts which remain are insufficient to give an idea of the abbey which

DAVID I. founded. Indeed, if it were not for the associations, or, in other words, if the remains were found elsewhere in Scotland, they would not be considered as interesting as those of Melrose. On that account it should not be difficult to retain all the masonry which has survived. The additions which should be necessary in order to form a chapel for the Knights of the Thistle would undoubtedly preserve the remains more effectually than by any other arrangement. To enclose the present area by a structure of steel and timber would only make confusion more confounded, for under those circumstances the ruins would be little respected. What Lord LEVEN proposed and what Mr. THOMAS ROSS can accomplish is the only way out of a difficulty which certainly has not afforded much pleasure to those who have to deal with it. Restoration has of course many interpretations. But Holyrood cannot be restored in the same way which is possible with an English cathedral or church which has been carefully tended.

IRISH ARCHÆOLOGY.

THE Journal of the Royal Society of Antiquaries of Ireland is usually interesting, and the latest number is no exception. Every one who reads newspapers must be aware that a large number of the inhabitants are endeavouring to resuscitate ancient ways by joining societies which have Irish titles. An example of the length to which the enthusiasm can go was afforded a few weeks ago at Brighton, when a variety to the monotony of the sombre coats on the platform was afforded by the appearance of a son of an Irish Lord Chancellor, who was clad in a suit that was supposed to be the ancient garb of his countrymen. It is to be hoped that all the revivals will be equally harmless and amusing. Some wisecracks, however, attach to the make-believe performances a political signification, and interpret them as outward and visible signs of a desire for independence of English rule.

What is to be devoutly wished for is that the efforts will have the effect of inducing the people to show greater respect to ancient remains of building and sculpture. For generations Irish ruins have been treated as if they were quarries from which stone could be obtained without other expense than the cost of removal. It cannot be said that the practice is at an end. The Journal furnishes evidence of the prevalence of the evil. Mr. P. J. LYNCH, for example, describes a remarkable circular stone fort which existed at a place called Caherlehillan, in the county of Kerry. It is now, he says, a complete ruin, for the stones were utilised by the improving farmer and road contractor. According to him "the stones are being removed for any purpose they may be required for; and in hare and rabbit hunting many a fine old *caher* has been almost levelled to the ground. And there are those who believe that the improving farmer will be so fully developed by the recent Land Act that it bodes ill for some of our ancient structures. However, a new spirit is animating the youth of Ireland, which, in its efforts to diffuse a knowledge of the nation's history and language, will, I believe, in no small measure assist in preserving our national monuments." The Rev. Mr. CARMODY, when describing an abbey in the same county, says:—"It were much to be desired that the Board of Works would take up the care of what remains of the abbey of Killagha. Our old ruins are our country's asset. These walls, whose value to the builder may be reckoned at a few shillings, become priceless as interpreters of our nation's history. With them we may live the past over again. By them we read into the ways and habits and thoughts of those who went before us." Others propose that the new County Councils of Ireland should undertake the preservation of remains. But as it would be impossible to have guardians surrounding every one of the numerous survivals of antiquity, there is little hope for their protection by officials unless the people are

desirous to respect such objects, whether they are in the form of ruined churches or single inscribed stones.

The necessity for greater general interest in remains is more urgent because the scope of Irish archæology is becoming wider almost every year. At one time abbeys, round towers, castles and crosses were supposed to represent the science. Subsequently stones with patterns on them and ogham stones bearing inscriptions were recognised as evidence. Later still earthworks and other forms of primitive fortification were valued. From a paper by Mr. T. J. WESTROPP it is evident that a very remarkable variety of the latter has still to be worked out, viz. what he calls "promontory forts." From being an island the coast was exposed to invasion. Landings were so numerous that one of the early annalists was able to compile the "*Leabar Gabhala*" or "*Book of Invasions*." Not only hordes of foreign peoples sought to secure possession, but the inhabitants of one district of the island could easily be organised for attacking another district by sending men in boats instead of over the land, where the roads were few or most likely did not exist. The construction of forts on the coast became a necessity. Nature also offered facilities for defence which were often turned to account. Mr. WESTROPP does not like the term "*cliff castles*" for those duns along the deep. He prefers "*promontory forts*" because they are generally found on projecting points of the coast. Before the attempts described in the paper were undertaken very few efforts were made to study or classify the defences, although everyone knew of their existence. Dublin, for instance, had a fine example at Howth. But about the attractiveness of the inquiry there can be no question. Mr. WESTROPP says of his own experience:—

A most fascinating study it has proved to be; and it is wonderful that many have not examined these monuments, and that notes on the majority of the forts are not to be had. The structures by their very nature occur in the boldest and most picturesque spots of the coast. Those who have joined the sea voyages of the Society round Ireland will recall the noble beauty of several of these sites; the great fort and cliff-crowned hill of Ben Madighan over Belfast; the rugged "*Balor's prison*" of Torry Island; the huge tower of rock fenced by Doonvinalla; the cliffs and bays at Doonamoe; Dubh Cathair in Aran; Doondoillroe in Clair; the hill that overlooks the Blasquets and bears Dovinia's ogham pillar at Doonmore near Sleah Head; the ramparts of Dunbeg and the great entrenchments at Baginbun.

Mr. WESTROPP proposes a provisional classification like the following:—(a) The simple promontory fort with a single wall or mound and fosse. (b) The complex fort of several earthworks with or without a wall. (c) The entrenchment and citadel, and (d) The multiple fort with a fenced promontory and lower fortified headlands connected with it.

The investigation is only, as it were, in its infancy, and therefore it is impossible to say at present when the forts were erected, and who were the enemies that had to be resisted. Some probably are prehistoric. But some are supposed to have been rebuilt if not originally constructed in Christian times. Legends are connected with several of them. Mr. WESTROPP in his paper describes only the examples he has visited in Waterford and Wexford. In one there is a fosse of over 50 feet in width. In another there is still a platform measuring 141 feet by from 40 to 60 feet. Some had a souterrain as a sort of final refuge. In one case the fosse was cut through the drift nearly down to the rock. But the most picturesque of those described by Mr. WESTROPP is at a place called Dane's Island, of which he gives the following description:—

Nothing save an actual visit can convey any adequate impression of its natural strength and grandeur; descriptions, views and plans tell but little. A huge tower of dark rock, a natural castle, raises itself up out of a dark recess in the cliffs, and high above the southern headlands, nearly (and in places absolutely) perpendicular, covered in parts by shaggy mantles of long grass, and joined only by a

narrow neck to the mainland, along which a dangerous path leads down and up steep slopes to the level platform on its summit. It must have been nearly impregnable to ancient warriors, with even a few defenders on its summit. The platform measures 150 feet to 170 feet across in both directions: the older maps marked the sites of three dwellings on the summit. These we could not see on our visit, the only earthworks visible being a slight fence like that at Island Hubbock, and about 4 to 5 feet high along the landward face. There was, however, in 1840, memory of, and evidently some trace of, a large entrenchment on the mainland, which has now entirely disappeared, its place being taken by modern fences. Smith, in his "History of Waterford," describes this rock as the resort of fowlers, but, as usual, tells us nothing of the earthworks. However, we can easily see that it represents an entrenched village on the cliff, with a citadel secure from any foe who did not take the trouble to blockade it—so far as we can judge, a very rare expedient in early times. To the east of the tower in the bay is a most curious group of monument-like rocks and islets rising over the shallow water, a huge menhir of rock, a natural edifice called Templeobrick and numerous reefs.

The advantages of these ancient fortifications is suggested by the old saying,

At the creek of Baginbun
Was Ireland lost and Ireland won.

The reason for it is that REYMOND LE GROS, one of the early Norman invaders, was able to hold the position with ten men-at-arms and seventy archers against 3,000 men sent to attack him. If Mr. WESTROPP is not able to continue his survey of the cliff forts it is to be hoped some other archæologists will take up the subject.

The most important description of a building relates to the abbey of Killagha, which is about eleven miles north of Killarney. The abbey was founded in the twelfth century on the site of an earlier abbey, and the name signifies the church of the beautiful place, for the district is picturesque. It belonged to the Augustinian canons, who at one time possessed a surprising number of churches in Ireland. Mr. CARMODY says that after the dissolution of the monasteries in the sixteenth century they did not seek, like the Dominicans and Franciscans, to recover their lost homes and to renew old connections. The two Orders named are now to be found in several places in Ireland near the convents of their predecessors, while there are not more than one or two Augustinian houses. The reason for the difference probably arises from the fact that as LUTHER was an Augustinian friar the Order was suspected of heresy. At the suppression of the monasteries in 1536 Killagha was overlooked. The monks remained until 1576. The church alone exists; the abbey was destroyed and the materials removed for use in other buildings. The church was rectangular and without aisles, having a length of 125 feet 5 inches and a breadth of 23 feet 5 inches. At the intersection of chancel and nave there was a bell-tower. The east window is still to be seen, and is one of the best examples of its kind in Ireland. But the view of it from the interior is obscured by a hideous vault, for not only the site of the abbey but the space within the church are used as a cemetery.

There are two papers by Mr. R. A. S. MACALISTER on "Inscriptions." In one of them there is reference to the drawings made by the late Sir THOMAS DEANE. The Americans in their eagerness to possess examples of antiquity are quite willing to be enriched with rude examples from Ireland. Iniscaltra is one of the islands in Lough Derg. An American who was one of a party was heard to remark on seeing one of the inscribed stones how pretty it would look in a garden on the other side of the water, whereupon it was carried off in a boat, and no doubt now ornaments the grounds of some costly residence. Other stones have likewise vanished from the same place. Students of archæology will find much else in the pages which will afford them interest.

CHICHESTER CATHEDRAL.

IN the course of the observations addressed by Mr. E. S. Prior, M.A., to some members of the Sussex Archæological Society who visited Chichester Cathedral, he said that although in point of size it was not among our large cathedrals, it was second to none in the interest of its story. Chichester Cathedral was founded at the latter end of the eleventh century as the capital church of the diocese, to be served by secular canons, that is, for the services of a body of priests (the bishop their head) who were, in the Middle Ages and are now, under no monastic rule to separate them from the common public life. As so built, and so continuing to be served, the cathedral had a distinction which separates it from half the cathedrals of England. It is, in this respect of being a bishop's secular church, on the lines of the great cathedrals of the Continent, but is on this account distinct from many of the old great cathedrals of England, which were founded as the churches of monks and continued monastic till the Dissolution. This distinction of having been founded as a secular cathedral Chichester shared with some other English cathedrals, but among these it has preserved to our times a larger and more complete body of its original eleventh-century secular building than any other. Now on the side of the faith and the liturgy which this building expresses this is a most significant distinction, for it was in the eleventh century that faith and liturgy stamped the whole craft of building, and therefore here, if anywhere, we might recover the methods and forms of that building of mighty churches which was the unexplained outcome of the Norman Conquest.

But beyond and apart from the interest of these questions should be our wonder at the building of the cathedral in the eleventh century—so sumptuous, so immense for the purposes to which it was put. It is to be observed that this first erection was on such a scale that the needs of the next eight centuries of Christian worship, with the vastly increased populations and their vastly increased luxury, have not needed materially to enlarge its ground plan. How was it that there came the ambition and the power of building so hugely and so commandingly? Surely not as mere heaps of stones, not as shapes and styles, not as designs and fancies, should we rate this eleventh-century building. The wonder of the cathedral was in the spirit of the men of the eleventh century, a mere handful of population compared with what now covers the countryside, and yet how filled with this passion to build magnificently. Custom has made us take the Mediæval cathedral in an ancient town as a matter of course. We accept it as natural that a building enormously larger and more massive than the whole tenements of a city should be put up as its church. But when we go back to its beginnings, when as yet there was no precedent, when we see how big a meadow, edged by the Lavant, was set apart for it, how around it were mostly wattle huts and thatched hovels, and then think of the cathedral as so conceived—the enormous masses of stone that had to be brought from over sea to make its walls, the forests that had to be cut down for the scaffoldings—when we see it set out with so sumptuous a choir, so extended a presbytery, such wide transepts—all so much in excess of anything that was really required for the services of the canons—and when we think of these mighty masses of masonry in the walls, such as needed the whole population to build them, then in Chichester Cathedral as it stands to-day we may read what a power lay in the faith of the eleventh century and how strongly the passion for building was part and parcel of that faith.

And not only what was built, but the way of building, can excite our wonder and admiration. A second ground for satisfaction with our Sussex cathedral lies in its fine presentation of the methods of Mediæval mason-craft. If the eleventh and early twelfth centuries were those in which the religious life expressed itself more markedly than in any age in building, the ensuing three centuries were those in which the craft of the builder developed in a way unexampled in the history of the world's art. Though its exhibition of this development is here but on a small scale compared with what the thirteenth century can exhibit in France, still the record is unrivalled in the lessons it gives, and in letting us read clearly the story of the Mediæval masons, the creators of the greatest stone architecture of the world. For one thing, the cathedral (as far as its interior is left at present) has not, as yet, been surrendered to the senseless surface scraping and renewal which, in some cathedrals, has given a nineteenth-century skin to the ancient work—not only an action of evident

ineptitude, but as repugnant to decency and reverence as when the wrinkles of old age are plastered up with enamel and paint to ape the bloom of maiden youth.

Three savage hordes have swept down on our ancient churches and defaced them: the horde of the iconoclasts in the name of religion, the horde of the churchwardens in the name of tidiness and the horde of the restorers in the name of taste. Of the three the vandalism of the restorer has been the most destructive to religious art, because taste is such a fickle death-dealing engine of hatred; what it cuddles to-day it spurns to-morrow; therefore everything in turn comes to be annihilated at its bidding.

What can be called Victorian art has been something essentially different in expression and scope from what preceded it. The difference may be shortly put as this. Whereas the workshop artist made and sold his works, the Victorian artist does not make but sells his art. It is made for him. He employs others to produce, and sells their productions as examples of his taste and design. This is what is called commercial art. Pretty well all the nineteenth-century productions put in this, and other cathedrals are of this description. Art that is continually being made only to sell does sell only. It has no other quality. We need not enter upon the question of this present-day art in its relation to modern life, but even as an archaeological Society we are bound to do so in its relation to the ancient cathedral. We are bound as archaeologists to protest against one form of this commercial art, and that is its copies of the Mediæval arts. What a fate for a cathedral like this, full of the ancient beauty, that this should be swamped out and overlaid by objects whose conception is puerile, whose make is bad workmanship and whose make-believe is an offence to the religious mind. Will it be said that this has been inevitable, that there is no other art for cathedrals but the commercial art of the modern shammer? Believe me, this is not the case. The different eras of art are bounded by no fixed line. The workshop artist whose glory it was to make his works has lived on into the twentieth century. It is not the case that there have not been plenty of religious artists, from whom this church and others might have had works of genuine piety. Has there not been that celestial visionary, the painter Blake? And has there not been the eminent serious sculptor, Alfred Stevens? Has not the art of Ford Madox Brown, of Watts, of Rossetti been religious? Has not the craft of William Morris been worthy of church art? With these men—and there have been many others—their work has been prayer. But in this cathedral, if we look for the works of these, the artists of the nineteenth century, we become conscious that whereas in the past eras the cathedral has always received the best work of its times, in the nineteenth century it has taken to its bosom the worst.

TRINITY CHURCH, HULL.

A MEETING of citizens was held in the Hull town hall on the 10th inst., in response to an appeal by the Mayor, to hear a report upon the condition of Holy Trinity Church, and to support a scheme of restoration. There has been for some years a continuous settling in the foundations of the church, especially of the tower, and, according to expert engineers and architects, repairs costing fully 10,000*l.* must be carried out at once if the building is to be saved from ruin. The mayor (Alderman Larard) presided.

In front of the dais in the banquetting chamber, in which the meeting was held, says the *Yorkshire Post*, was arranged a series of photographs showing the state of the foundation, an ominous crack over one of the arches and the shoring up of the tower. There were also four glass jars filled with a dark powder, to which some of the oak beams have been reduced.

Mr. F. S. Brodrick, the architect who was consulted in the first instance by the church authorities, briefly described the present condition of the building. He said that the settling of the foundations of the tower had been going on for some time. This had rendered extensive repairs necessary six years ago to some of the arches adjoining the tower, and also to some of the windows. Latterly, having been asked by the vicar and churchwardens to watch the structure, he discovered that the movement had continued, and to such a serious extent that action should no longer be delayed. Knowing what a heavy amount of expenditure would be incurred, and not caring to take all the responsibility of advising it upon himself, he asked for the assistance of Mr. Francis Fox, and that gentleman was commissioned to examine the church and report. As soon as the report

was made it was resolved to shore up the tower, and the work was entrusted to Messrs. Thompson, of Peterborough, who had nearly completed their task. Upon examining the foundations of the tower they found a space of 10 inches of decayed wood upon which the tower was partially dependent for its support. They also found that the pillars of the nave were standing upon piles that were very badly decayed.

The Mayor said that as some doubt had been cast upon the accuracy of the report of the experts, he had been asked to get independent testimony as to the state of the church. Accordingly he communicated with the city architect (Mr. Hirst), who found that the cross timbers, upon which the piers of the tower rest, have been practically reduced to dust. There could be no doubt that the tower was settling down and unless the movement was arrested the church was doomed. He was certain that no man, whatever his religious opinions, would deny the desirability of keeping this magnificent fabric in order.

The Rev. A. B. G. Lillingston, the vicar, thanked the Mayor for the encouragement he had given them in this matter. Already 1,000*l.* had been spent in removing the organ and in shoring the tower in order to guard against imminent danger, and with these measures the church was now absolutely safe. But 9,000*l.* must be obtained beyond that sum in order to carry out the necessary work. He appealed not only to Churchmen, but to all the citizens of the town, because it was a national affair. Holy Trinity Church was the first place that strangers went to when they visited Hull, and he promised them that so long as he presided over it its national character should be preserved. He moved a resolution affirming the desirability of taking steps to carry out the proposed restoration and of opening a fund to be called "The Holy Trinity Church Restoration Fund."

The Bishop of Hull gave his hearty approval to the scheme. They had in the restoration of York Minster an illustration of what Yorkshiremen could do, and he had no fear that the men of the East Riding would neglect Holy Trinity, which was in a sense the centre of worship in that city, as well as its noblest edifice.

Mr. Francis Fox (architect and engineer) said that when he first examined the church at the request of the vicar and churchwardens, he thought the situation extremely grave. But he hoped they would be able to save the old church, which historically, archaeologically and architecturally was good enough to be a cathedral.

The resolution was carried unanimously.

EXETER CATHEDRAL.

THE secretary of the Society for the Protection of Ancient Buildings calls attention to the west front of Exeter Cathedral, which is, or was, one of the most interesting façades in the world. A short time ago the stonework of the large west window was rebuilt, and now the canopied work is being renewed.

Before the work was begun the Society asked the Dean and Chapter whether they intended to publish any report or statement upon the condition of the west front and what was proposed to be done to it. A reply was received to the effect that the Dean and Chapter, having taken the advice of a competent authority, declined to share their responsibility with any irresponsible authority.

The Society publicly called attention to the value of the west front and of the danger which threatened it, and although the Society was aware at a later date that the iconoclasts were at work, it took no further action, knowing that any remonstrance with the Dean and Chapter would be useless. There seemed to be nothing for it but to wait and see what the public would say. Now that holiday-makers are returning they are beginning to receive adverse opinions, and therefore it seemed wise to get a description made on the spot of what has been done, and the following is a quotation from it:—

"The most recent work done to the front is the complete renewal of a series of three or four canopies and a length of the cornice on the south division of the front. The shock of this work is almost more disturbing than any example of 'restoration' I have ever seen. In work mainly of sculpture this must be so, and the old images in such a setting are absurd. The new work is fully as striking as the marked photograph enclosed [a monochrome photograph marked in red]. As to the 'correctness' of the mere shapes, one might put a dozen things there and claim that they were 'correct.'"

"The canopied work is so weathered that to put a fixed form as definite as a piece of machinery on this faded lacework requires great hardihood, and that is what it has got.

"The great window, as you know, is now new, the upper gable is new, some of the raking arcade is new, pinnacles new. About half the front (except the images) is now new. Only a few years ago it seemed an ancient front. It looks strangely small and foolish now."

Deans and Chapters always say that they are solely responsible, but how the Dean and Chapter of Exeter can justify their action in this case it is hard to say. But it is quite certain, says Mr. Turner, that the Mediæval art treasures of England cannot be of modern carved stonework, and it is time to ask whether a modern cathedral or an ancient one is required. We believe, although we are not certain, that the evil deed cannot, as usually is the case, be thrown on to the shoulders of an eminent ecclesiastical architect. Of course, the real difficulty has been and is the surface decay of stone. In the opinion of the Society the application of lime and baryta meets this difficulty satisfactorily.

The Dean of Exeter, in the course of an interview with a correspondent, explained that the stonework of the large west window had not been rebuilt. It was restored when a stained-glass memorial to Archbishop Temple was inserted. At that time the stonework was found to be in a very dangerous state of decay, but not an atom that could be preserved was displaced, and, as a matter of fact, a good deal of the old stonework remains to this day. The work now being carried out in connection with the west front was absolutely imperative. There was a great risk of portions of the structure falling away bodily, with perhaps serious results for some of the public, for whom there is a footpath along its whole length.

The cathedral architect was, he said, not allowed an unfettered hand, for some members of the Chapter invariably inspect those portions of the building reported to require renewal, and in these cases every scrap of old material which could be retained was kept in place, and where new work was inserted details of the old work were faithfully reproduced. Great care was displayed in continuing the ancient features. "It is better," said the Dean, "to have faithful reproductions in new stone than a mere heap of black dust or a few broken walls of stone. That is our policy, and it has the warm support of the well-known ecclesiastical architect, Mr. Bodley."

THE HORNBY GIFT TO LIVERPOOL.

"AND I desire that my executors shall in due time offer to the authorities of the city of Liverpool my art library and collection of engravings, autographs, &c., on condition that they shall be kept as a separate collection for the use and benefit of the art-loving public of Liverpool. And in the event of their accepting the same on these terms, I further bequeath to the city of Liverpool a sum of 10,000*l.* to assist the authorities to provide a building in which to store this collection and in which the engravings, books, &c., may be exhibited to the public."

So runs a codicil to the will of the late Hugh Frederick Hornby, who died on September 5, 1899. Those instructions, so briefly and modestly set forth, have been fulfilled, says a correspondent of the *Liverpool Courier*, not with any great flourish of trumpets indeed, but with the utmost scrupulosity and enthusiasm. The magnificent gallery adjoining the Picton reading-room has been erected, the books, autographs, prints, etchings, engravings, mezzotints and bindings have been carefully systematised and catalogued, and on Friday, the 26th inst., the doors of the Hornby Room will be formally thrown open. That opening ceremony will be, no doubt, a comparatively brief and modest affair, but in spite of its brevity and its modesty it will mark not only an event of very profound importance in the art history of our city, but also the consummation of the life history of one of the most singular and most admirable of our city's sons.

Hugh Frederick Hornby was a man of considerable wealth, of wide culture, of strong and diligent enthusiasms, and during the last four decades of his life, with an energy that seemed positively to increase with increasing years, he devoted those gifts, both personal and pecuniary, to the pursuit of a single object. That object, as is now generally recognised, was the establishment in Liverpool of a collection of prints and art books which should take high rank

among the half-dozen most important private collections in the country, and in view of the codicil which we have quoted it is not difficult to believe that the ultimate goal of his efforts was the transference of that ideal collection to the city whose name was so inextricably associated with that of his family. It was a notable ideal and a difficult one, and although it is certain that many of his schemes were aborted by his death—although it is certain that the princely collection which he succeeded in making was scarcely more than the nucleus of the priceless collection he had designed—there is still room for not the faintest doubt that he moved admirably near to its realisation. He spent lavishly, but always shrewdly; he moved boldly upon occasion, but his plans were always laid with the extremest care; he knew the value of patience, the worth of the waiting game; he never permitted his own knowledge or instincts to carry him counter to the judgment of the little body of devoted experts whom he employed. And, as a result of these qualities, his collection has an interest and importance so great that it will inevitably command the most widespread public attention—an attention far from merely local, probably more than national—an attention, at all events, very dramatically at variance with the circumstances which marked its conception.

For it was with all the appurtenances of secrecy, in an isolation almost unbelievably complete, that Mr. Hornby followed his quest. No man, one would have said, was better equipped than he for the activities of society, the successes of public life. He was a man of singular charm and courtesy, eagerly intellectual, a lover of fine things as well as of rare. His own water-colours are distinguished by much delicacy and clarity. As a linguist he had something approaching a reputation. His fondness for music led him to take an active part in the foundation and early development of the Philharmonic Society. He had a knowledge of heraldry unsurpassed by experts, he had travelled widely, he read much, he corresponded freely, and he lived from first to last an intellectual life. And yet, in spite of these qualifications for the part of a man of the world, he lived a life of the severest reticence, a life almost monastic in its seclusion. It seemed to him that if he wished to realise his great ideal with any adequacy he must pursue his labours secretly. If his plans were to be prosecuted with complete success, if his collection was to become unique, he must make his moves both cautiously and covertly. And so, as his enthusiasm increased and his purchases multiplied in importance and extent, he withdrew himself more and more from the world, and built a high rampart between himself and the great public, whom he designed so splendidly to aid. These are no mere figures of speech; the precautions he took to secure his privacy were really quite extraordinary. He rented a room above Mr. Howell's bookshop in Church Street, and, carefully concealing the fact of its existence from his friends, from his intimates, even from his wife, brought there all the most valuable prizes of the last twenty years of his life, issued from there his instructions, retired there day after day to formulate his plans. A single individual shared his secret, and that individual was his aide-de-camp, Mr. J. S. Arthur, the well-known bibliophile and connoisseur. "The Crypt," Mr. Arthur used to call this stronghold in his letters to Mr. Hornby, and these cryptic references, and the atmosphere that surrounds all solitary and concealed endeavours, invest Mr. Hornby's figure with a curious romance. He sat there, forgetting his city awhile in order that he might one day become her memorable benefactor; and although the clangour of her movements surged ceaselessly about the walls of his chamber, he remained as remote, as unsuspected, as free from interruption as any wilderness-surrounded hermit.

Of the magnitude and variety of the collection itself it is impossible here to speak with any adequacy. The official catalogue of the books alone, compiled in the most admirable fashion by Mr. Cowell and his assistants, contains some 700 pages, and includes references to about 8,000 volumes, and there remain besides the autographs, the engravings, the art bindings. But it should at least be pointed out that, although Mr. Hornby was perhaps less an amateur than a connoisseur, more a student of "states" than of "états d'âme," he had also a keen appetite for the merely beautiful, for the things whose value is in no way dependent entirely upon their rarity. He was, as we have seen, a water-colourist and a musician, as well as a student of heraldry, and in this collection all that purely æsthetic side of him is very valuably reflected. Macbeth, Haig, Herkomer, Strang, Finnie, Blanchard, Cousins, Lowenstein, figure among the

engravers; there are some magnificent Whistler etchings, many Seymour Haden's, several Meryons, certain admirable Dürers, a complete set of the Kelmscott Press productions, a most excellent series of Walter Crane's, innumerable illustrations by Cruickshank and Bewick, a large collection of Constable reproductions and of Turner's "Liber Studiorum." Bartolozzi and his school are largely represented, and the series of eighteenth-century French illustrated books is of singular excellence and completeness. There are between six and seven hundred specimens of book-bindings, including examples by Marius-Michel, Thierry, Bozerian, Lewis, Bedford, Chivers and Fazakerley. It is no mere collector's collection; it is the collection of a shrewd bibliophile who was also a lover of art.

One word at least should be said with regard to the building in which the collection is to be housed. Constructed from designs prepared in the surveyor's office, its scheme is almost purely Classical, breaking here and there with a careful reticence into faint notes of the Renaissance. A bust of Mr. Hornby by Mr. C. I. Allen will be placed in the room, and there will be an elaborate arrangement of shelves, frames and cases, the result of Mr. Cowell's enthusiastic ingenuity. It is an admirable shell for so precious a kernel—dignified, reserved, austere—and reaching back through its Ionic columns to other ages and finer expressions, catching up these expressions, re-echoing and conjoining them, as does the collection itself, for the benefit and inspiration of modernity.

SHEFFIELD ARCHITECTS' SOCIETY.

THE opening meeting of the session was held on the 11th inst. when Mr. E. Holmes, president, delivered an address. After thanking the members for his re-election, he commented upon the fact that they were meeting again in their old rooms. Negotiations, however, were proceeding with the Sheffield University authorities which he hoped would result in all future meetings of the Society being held from Christmas onwards in the new University buildings. He also mentioned that a complete scheme for the education of architects and surveyors had been formulated by the Council of the Society, and now only awaited the sanction of the University authorities.

Mr. Holmes referred to the negotiations with the City Council as to the proposed new by-laws. Their criticisms, he thought, were now admitted not to have been in any way destructive, but intended to simplify the by-laws and render them more workable and practicable. He laid stress on the absolute necessity of providing better and healthier dwellings for the working classes, and expressed the opinion that it lies in the power of large landowners in the neighbourhood of large towns to correct the evil of overcrowding to a great extent by laying out their estates with wider roads and deeper plots, by judicious planting of trees, and by providing open spaces for recreation, &c. The co-operation of municipal authorities to this end was invited by framing by-laws more applicable to rural districts, and of less stringency than are necessary in purely urban districts, and he suggested that the Local Government Board should assist municipalities to this end. The housing problem might by careful thought be settled on natural and commercial, instead of on artificial lines, which did not commend themselves to business men. He then referred to the question of acquiring by municipalities open spaces round cities, and expressed the hope and the belief that the new road undertaken by the Corporation through the Rivelin valley would prove a success, both artistically and commercially. With regard to the vacant sites in the possession of the Corporation, he suggested to the members of the Society that they might usefully turn their attention to the solution of how to deal with these vacant sites. A vote of thanks was accorded to Mr. Holmes.

TRAJAN'S COLUMN.

AN article on Trajan's Column by Signor Boni appears in the *Nuova Antologia* for this month. The Rome correspondent of the *Morning Post* supplies an abstract of it. Signor Boni's excavations and investigations have led him to the following conclusions with regard to the column. First, that it formed no part of the original plan of the Ulpian Forum, for the surface of the latter was cut by its

construction. Secondly, that the column does not indicate, as is usually supposed from the inscription on the base and from the well-known passage of the historian Dion Cassius, the height of the rock which Trajan cut away and removed, and which before his time, in the picturesque phrase of Dean Merivale, had formed a "narrow isthmus" between the Quirinal and the Capitoline. Merivale himself regarded the statement of Dion Cassius as "quite inexplicable;" Signor Boni believes that he has disproved it by discovering, at the very base of the column, the remains of two ancient roads, one beneath the other, a drain, various pieces of archaic pottery and of terra-cotta lamps, and other archaeological strata of an obviously earlier date than the construction of the Ulpian Forum. Accordingly, he maintains that the column was not intended, as the inscription has been thought to imply, to be the record of an engineering feat, but as a monument sacred to the memory of the Great Emperor who had conquered the Dacians. Commendatore Boni's excavations certainly seem to have disposed of the conventional explanation of the inscription, "Ad declarandum quantæ altitudinis mons et locus tantis operibus sit egestus." At the same time his free translation of the words "To show how deep was the valley and how high the works," would scarcely, taken apart from his discoveries, satisfy Latin scholars. Pending further explanations, all that we can say is that there is a contradiction between the undoubted facts disclosed by the excavations and the words of the inscription.

Signor Boni's attention was first drawn to the column by the desire to discover the sepulchral chamber, where the golden urn containing the ashes of the emperor was placed. Although the fact of Trajan's burial there is mentioned by Dion Cassius in the third century, by Aurelius Victor, Eutropius and Eusebius in the fourth, and by Cassiodorus in the sixth, and although the sepulchral chamber and the loophole through which light could penetrate to it are plainly shown in plans of the sixteenth century, the entrance to it had been walled up in comparative recent times, and its existence had been denied by some competent archaeologists. Signor Boni's workmen with a few strokes revealed the entrance to the chamber, some 5 feet by 10. While making the recent excavations Commendatore Boni found some rough marble fragments, the remains, so he believes, of the primitive church of St. Nicholas of the Column, which rose at the foot of the monument, just like the still standing church of St. John of the Column at Athens. These pieces of marble, among them a portion of a screen, he has placed on the wall which bounds the excavated area of Trajan's Forum. Early in the eleventh century the spot must have been neglected and the very name of the emperor had been forgotten, for a document of 1003 describes it as a garden covered with fig trees, while the column was blackened by the smoke of a limekiln—a very dangerous but unusual neighbour of Classic monuments in the Dark Ages. In 1162, however, the Senate restored the church of St. Nicholas of the Column to the nuns of St. Ciriacus, and threatened to put to death anyone who might injure the monument of Trajan, and to confiscate the property of the offender. The church was demolished by Pope Paul III. about the middle of the sixteenth century in his zeal to preserve the Classical at the expense of the Mediæval buildings of the city. Before the century closed, however, Sixtus V. placed the existing figure of St. Peter on the top of the column, where that of Trajan had once stood, but whence it had long fallen. The biographer of that Pope tells us that the statue of the Apostle "supported the urn, in which the ashes of Trajan had been preserved"—a legend adopted by Addison and by Byron in the well-known lines of "Childe Harold":—

Apostolic statues climb
To crush the imperial urn, whose ashes slept sublime
Buried in air, the deep blue sky of Rome,
And looking to the stars.

As a matter of fact, the golden urn had long before that date disappeared.

A Proposal was made at the annual meeting of the Truro Cathedral building committee for a grant towards the cost of removing the stone pulpit to another part of the cathedral, in order that the preacher might be heard to greater advantage. The opening of the lantern tower, it was said, had resulted in an increase of beauty but an immense loss in acoustics, and until that matter was dealt with the services would never be satisfactory.

NOTES AND COMMENTS.

THE improvements committee of the London County Council were blamed on Tuesday for allowing themselves to be duped by speculators who obtained a promise of a lease for ninety-nine years of the central portion of the crescent site in the Holborn to Strand improvement at a rent of 55,000*l.* a year. The first year's deposit was to be paid on August 10. Then a fortnight's grace was given, and up to the present no money has been forthcoming. The syndicate offered the familiar excuse that they could have completed the arrangements if they were allowed more time. As the offer was accepted on March 20 last, or seven months ago, the excuse is of no value. Why should the improvements committee be blamed for the part they have taken? The so-called improvement was premature. An enormous sum was expended, for which there cannot be a speedy return, if ever there is one. And the improvements committee were only doing their duty in endeavouring to lighten the burden of the taxpayers to some extent. But the failure is likely to have an ill effect. The improvements committee, for a time at least, will be less disposed to meet the views of speculators, in order to avoid further abuse like that of Tuesday.

FROM the evidence which was given by Colonel HELLARD, director-general of the Ordnance Survey, on coast erosion during the last thirty-five years, it would appear to be difficult to balance the losses and gains. Particular districts, no doubt, suffer, and in some places there is reason to be panic-stricken. But, on the other hand, during the period mentioned the rateable area of land in England has been increased by over 30,000 acres. All the gain is not to be credited to the action of the sea. Some, no doubt, is due to reclamation, as at Southport, Morecambe Bay and the Wash. Lincolnshire lost 400 acres, but the area of the land was increased by 9,106 acres. Suffolk has been the greatest sufferer, having lost 367 acres, of which 250 were covered by the sea within the last twenty years. In the short distance between Littlehampton and Worthing, or about ten miles, there has been a gain of 1,018 acres. Northumberland is increased by 8,600 acres, Yorkshire by 1,404 acres. The coasts of Dorsetshire, Cornwall and Somersetshire have been little altered. The Royal Commission has yet to discover whether any methods can be adopted to prevent the loss of foreshore. But we suppose there is no discontent among owners of littoral properties where their lands have been increased in area without any expense to them.

THERE was a great deal of mystery about LEONARDO DA VINCI while he was living, and it was only consistent that there should be mystery concerning his death. VASARI says that the great artist was visited by FRANCIS I. after he had received the sacraments for the dying. He was seized with a paroxysm, and the king raised his head, and "the spirit of LEONARDO, which was most divine, conscious that he could attain no greater honour, departed in the arms of the monarch." The story is no longer believed. But it is remarkable that VASARI does not mention where the death occurred nor DA VINCI's burial-place. According to AMORETTI, DA VINCI made a will on April 13, 1518, or a year before his death, in which he expressed his wish to be buried in the church of St. Florentin at Amboise. He was living in the château of Cloux, near that city, and during the three years he was in France he was more occupied with a scheme for a canal than with art. Assuming that his intentions were carried out, there was not the least memorial set up in the church of St. Florentin. The building was demolished in the early part of the nineteenth century. M. ARSÈNE HOUSSAYE was allowed in 1863 to make excavations on the site of the church. A skeleton was found exceeding the

average size, and a skull that was remarkable in form. Fragments of slabs were dug up, on one of which "Leo" was inscribed, and on another "inc." The letters were assumed to be parts of a Latin inscription on the tomb. Afterwards a document was found which was supposed to be abstracted from a register, which stated that LEONARDO was buried in the cloister. The difference is not to be explained. The Società Leonardo da Vinci of Florence has announced that efforts are about to be made to discover the remains of the artist. But it is to be feared that no means were taken to distinguish LEONARDO's grave from those of ordinary men.

SCOTLAND is not rich in examples of the secular architecture of the Middle Ages. On that account Stirling Castle, parts of which date from the twelfth century, if not earlier, is of very great importance. JAMES III., who reigned in the fifteenth century, built the Parliament Hall which is a portion of the castle. The structure is still recognised as having some use as a fortification. It forms a most picturesque feature in the landscape, and for that reason has been a favourite subject with painters. At present the buildings are in the care of the Royal Engineers. They lately engaged in restoring the Parliament Hall, and there is no difficulty in imagining the manner in which the work was to be carried out. H.M. Office of Works for Scotland has taken the incomplete structure in Stirling known as "Mar's Work" into its charge. It is a sixteenth-century fragment containing a good deal of sculpture. The Town Council now wish that the castle should be transferred to the same authority, for with the officials of the Office of Works there is some certainty that there would be no destruction of any historic feature.

RITZ HOTEL, PICCADILLY.

THIS large building was one of the first examples of the American system of construction which was produced in the Metropolis. In it are steel framing, fireproof flooring, a grillage foundation and other specialties. It was a difficult site to deal with, for the space was limited and there was no place for the storing of materials. The mortar was mixed in the basement and the stone was dressed on a platform with a watertight roof over the footway. Some of the girders were 30 feet in length and weighed about 20 tons, and there were also cantilever girders weighing 11 tons each. For these special methods of handling had to be adopted, while the remaining steel was delivered in 2-ton lots and hoisted by derricks. The excavation was commenced in June 1904, and the building was completed by October 1, 1905. Messrs. MEWES & DAVIS were the architects. They also designed the whole of the decoration of the interior. The general contractors were the Waring-White Building Company, Ltd. The flooring was constructed by the Columbian Fireproofing Company, the elevators by the Otis Elevator Company, and the locks and other ornamental metalwork by Messrs. YALE & TOWNE, Ltd. As a contrast we also give a design for a hotel in the same position by the late firm of Messrs. WIMPERIS & ARBER, when Piccadilly was considered to be a select street rather than a great thoroughfare to which all the world may resort for accommodation.

BENFLEET AND HADLEIGH.*

THE great waterway to London town, which city from the earliest times has been both the wonder and envy of other nations, presented at its estuary the first opportunity to the marauding invader, who had braved the perils of the North Sea in his many-oared galley, of committing raids on the country side. In the days when the Norsemen and Danes visited our shores on those errands the river Thames must have presented at high tide an expanse of water many miles wide, while at the ebb miles of mud flats were revealed on one or both sides of the main stream, through which sundry tributary streams found their way.

At Benfleet such a one appears, and presented a favourable chance for a Danish headman named Hæsten, who landed and probably on the high land above the stream set up a castle with deep ditches, and it is recorded that from this stronghold "he and his men much infested the English thereabouts," so that King Alfred took the matter up, and making an expedition against the offender, took the castle, and after demolishing the stronghold and destroying the Danish ships lying in the creek, he took Hæsten's wife and children prisoners and brought them to London. Hæsten, however, escaped. The site of the stronghold can be traced between the station and the church. When the London,

shall refer presently. The raised emblem is in excellent preservation, but the corner of the slab is gone, and only four letters—"M A R C"—are visible. This slab now lies on the floor by the pulpit.

There is a fragment of an old brass affixed to the dado on the south side said to bear date 1568, and to be in memory of one William Cardinall, whose daughter married (temp. Henry VIII.) Sir Wm. Appleton, lord of the manor of Benfleet, and whose descendant in 1622 engaged the enterprise of Joas Croppenbergh and of Cornelius Vermuyden to repair the broken sea wall of Canvey Island and embank portions not till then enclosed. Of the letters of his name "C A R D" alone are decipherable, the remainder having been lost.

There is a well-preserved slab to the memory of a Sir William Appleton, his wife and their two sons, bearing date 1705, on which are the curiously quaint lines:—

Two blooming youths, Can you forbare a groane,
Inclosed ly, Beneath this marble stone.

There is also in the chancel a pretty cinquefoil-headed piscina well preserved. The south aisle was built 1320, and was originally at a higher level than the nave, and contained at its east end a chapel, the credence in which is an

SOUTH BENFLEET CHURCH.

HADLEIGH CHURCH.

Tilbury and Southend Railway Company were constructing the bridge over the creek on the London side of Benfleet station, they came, in sinking their pier foundations, upon the remains of some old viking's ships, very possibly those sunk by King Alfred in this engagement.

A Saxon church is said to have been in existence at Benfleet even at this early time, and if so we may assume that our gentle forefathers flayed their Danish prisoners and nailed their skins to the church door, after the manner customary in those days of celebrating a victory. The present church at Benfleet, dedicated to St. Mary the Virgin, is undoubtedly of Norman foundation, and is believed to have been built about 1140. It then consisted of chancel and nave only; the fact that the doorway to the tower at the western end of the nave is intact to-day shows that at this period it formed the exit door from the building. The chancel as it now exists was rebuilt in 1300, and there are several interesting points regarding it.

There is an old tomb slab fragment of uncertain history and date, but probably originally marking the grave of Wymarc, son of Suene and grandfather of the Suene who subsequently was known as Henry de Essex, to whom I

interesting feature to-day. In 1390 the tower was added, and you will perhaps have noticed the mixture of materials of which its walls are comprised, viz. flint, Kentish rag-stone, pieces of red tiles and other sundries, showing, as I think, that the remains of the earlier buildings, probably including Roman, were used as quarries. Consecration crosses are also noticeable on each of the tower buttresses. The north aisle was added, a new roof put on to the nave and the south porch built in 1430, and it is probable that at that time the arcades between the nave and arches were formed.

There was in pre-Reformation times a chapel at the east end of the north aisle matching that in the south aisle, and the credence or piscina is still visible, as also is curious recess on the north angle, where a picture probably was placed. The stairway up to the rood-loft is still intact in the last buttress of the north aisle wall, and it is remarkable for its position, inasmuch as a gallery must have been constructed across the aisle and the eastern nave arch opening to get to the rood-loft, which of course stretched across the chancel arch, and it is quite likely that there was also a rood-loft to the north aisle chapel, which was used as a lady chapel. Eight quaintly carved corbels are visible on the nave walls carrying roof bearers; four of them are said to represent the emblems of the four Evangelists. The

* Read at a meeting of the Upper Norwood Athenæum on September 8, by Mr. Frederick Higgs.

windows of the north aisle were inserted about the middle of the sixteenth century, and one of them contains fragments of ancient glass. The south porch is one of the finest examples of fifteenth-century woodwork of its kind extant, and deserves careful and close examination, particularly the beautiful cusped bracketing of the roof beams and the delicate form of the open panelling of the sides of the structure. It remains to-day almost entirely the identical article that left the hands of the craftsmen of five centuries since, saving only for the inevitable wear and tear of time.

There are five bells, the earliest dating 1636. The vicarage is in the gift of the Dean and Chapter of Westminster Abbey, and it was also in pre-Reformation times attached to that abbey and convent. The vicar, Rev. C. F. Box, has rendered a good service to our Society by being present and explaining the objects of interest connected with the church, and to-day we are grateful to him.

Hadleigh Church.

Hadleigh Church, which we next visited, is more interesting in some respects, inasmuch as the structure itself has been subject to less alteration than its sister building of Benfleet, and it is without doubt the identical Norman erection of the early twelfth century, the church having been erected in Stephen's time.

A restoration was effected in 1856 under the late Mr. G. E. Street, who apparently did away with several very interesting characteristics which he might very well have preserved, notably some delicately cusped niches on the jambs of the centre window on south side. The apsidal chancel clearly indicates its Norman origin, as also does the chancel arch in its bold simplicity. The credence niche is on the north side of the altar-table. There is an aumbry or cupboard recess on each side of the chancel, formerly having oak doors, which were removed as decayed and useless at the restoration. Each side of the chancel arch is a recess, which some authorities suppose were subsidiary openings, latterly blocked up, but I believe they have always been recesses, and served as altar-spaces for minor chapels.

Through the backings of these recesses are cinquefoil cusped hagioscopes, each formed on the skew.

On the reveals of the deeply recessed north aisle windows there are two remains of ancient frescoes. One a fragment only, representing an angel, the other, St. Thomas à Becket, who was the patron saint of the church, with the superscription "Beatus Tomas." This is quite an important fragment, and Mr. Street did well in both cases to take care of them. "Beatus" in the superscription, and the absence of a halo round the head, show it to have been executed subsequent to Becket's death, but anterior to his canonisation. There are also other pieces of old uncovered plaster, showing very faint traces of Mediæval mural painting, which many of you noticed to-day. The windows have in several cases been altered in the Decorated period, and contain no old glass, but the new memorial windows are very good of their kind, and there are some to the memory of the King family, who appear to have done a good deal in the way of assistance at the restoration and otherwise.

There is in the porch an old holy-water stoup which survived the reforming energies of the sixteenth century. A leper squint is said to have formerly existed in the south chancel wall, but no trace exists at the present day. A curious corbel is to be seen on the south side of the chancel apse, which once perhaps served to sustain an image, but now carries a quaint alms-dish presented to the church at a comparatively modern date, but is I believe ancient. It is illustrative of Paradise with the serpent tempting Adam and Eve. The font is of Purbeck marble. The pedestal dates from Mr. Street's restoration. I have said the building has been restored; plaster was freely used, and Mr. Street effected some wonderful ornamentation around the jambs and arches of the doors and windows, but one cannot but wish that he had (supposing such to have been possible) retained the old facings with simple repairs rather than entire renewal. The one bell (date uncertain) is hung in a wooden turret, shingle covered, at the west end, and supported by oak timbers built up from the nave floor. The church is dedicated to St. James the Less. In the churchyard is buried one "Cunning Murrell," who died as recently as 1860, and who is said to have "devoted much of his life to astrology, quack doctoring, veterinary surgery and the casting out of devils; an exponent of the black art, and capable of casting the evil eye"—eloquent testimony to the lack of enlightenment prevalent in this old-world district even so recently as forty-six years ago.

Hadleigh Castle.

We have seen how the Danish pirates in the eighth and ninth centuries harassed the then inhabitants of the country, and suffered alternately success and defeat. After a time they seem to have obtained the mastery, and we find three Danish kings occupying the throne. Their yoke could not have been by any means galling, as we find that they quite assimilated themselves with those they conquered. Accordingly, when William the Conqueror obtained sway, he found various lordships in the hands of Danes, and in these parts Suene, whose father-in-law's tomb we see at Benfleet, held fifty-five manors, including that of Hadleigh. His grandson, Henry de Essex, was dispossessed by Henry III. for cowardice during the Welsh wars. He was standard-bearer to the king, and in the thick of the fight, when it appeared that the Welsh would win, he flung down his colours and turned tail. The English lost the day, but subsequently won, when the degradation of this squire took place. This manor was granted by Henry III. to Hubert de Burgh, Earl of Kent, who constructed the stronghold whose ruins we have seen to-day. The situation is particularly fine, standing on the side of the bluff overlooking the Thames estuary, with the high land of Kent beyond. The enclosure measured about 300 feet by 120 feet, and was roughly oval on plan, standing north-east and south-west, with the entrance gateway at the north-west angle. The castle proper was at the eastern end, where two gigantic towers formed a chief feature

HADLEIGH CASTLE.

in the block. I suppose the dwelling was located at or in these two towers, and was constructed in three storeys, and I can quite imagine the gay times which must have taken place here when the courtyard was cleared for a tourney, and the royal and other ladies filled the window niches, encouraging by their glances the gallants who contended for their favours in the presence of all the country side assembled for the fête. The present ruins afford little indication of the arrangement of the place. It is evident that on the south-west side there were several apartments connected with the business of the place—ammunition stores, guard-rooms and the like, and perhaps a chapel. Although now little more than a mass of ruins, there is ample evidence that it was once a lordly and important palace. The thickness of the walls and their composition of flint, ragstone and mortar should be noted. One of the secrets of the sound building of this age was the ample grouting and flushing up they practised, rendering the walls thoroughly solid. After Hubert built the present building it fell into decay, and Edward III. appointed one John de Tyneside to repair certain houses in his castle of "Haddleye," at the rate of twelve pence per

day, principally in the apartments known as the king and queen's chambers, showing that it was a royal residence.

It remained in royal hands for several reigns, and we find Henry VIII. granted it to his fourth wife, Anne of Cleves, as a residence, together with a pension of 3,000*l.* per annum.

Edward VI. granted it in 1552 to Richard, Lord Riche, from whom it passed to his descendants, the Earls of Warwick. The castle and manor have recently been acquired by the Salvation Army social scheme organisation, and one hopes it may, like the Phoenix, rise from its ashes a nobler structure than ever it was before. I am greatly indebted to our secretary for his invaluable assistance in the arrangement of this ramble, and to his hints in the preparation of this paper; to the clergy of Bensfleet and Hadleigh for their kindness, geniality and hospitality.

GLASTONBURY ABBEY.

THE statement about the offer by Americans to purchase the ruins of Glastonbury Abbey may excite surprise. But they have of late years acquired so many works of art, it is allowable for them to imagine that they could increase the number by some examples of ancient architecture. So long as the Parthenon sculptures are to be seen in the British Museum, we should hesitate about condemning any people for endeavouring to enrich themselves in the same way. The selection of Glastonbury Abbey shows an appreciation of architecture. It is ancient, and it possesses extraordinary historic interest. The place is the poetic Avilon associated with the Arthurian legends. A church existed at so early a date at Glastonbury, the tradition was allowable that it was founded by Joseph of Arimathea. Geraldus relates that he saw a leaden cross in the twelfth century exhumed at Glastonbury, which stated that it marked the site where King Arthur was buried. In the beginning of the eighth century a new monastery was erected which was respected for centuries. A Norman was appointed by William the Conqueror as abbot, and he did much else to diminish its importance. But afterwards the abbey again prospered, and it was one of the mitred abbeys of the country. At the time of the Dissolution the revenue was about 3,500*l.* a year. The great church was cruciform in plan, and had a length of 380 feet.

When the Royal Archæological Institute visited the district some years ago the late Professor E. A. Freeman undertook the office of guide. He pointed out that in the morning he had spoken under the shadow of a great church which pretty well told its own tale. Standing under the cathedral church at Wells, and using their own senses, they might almost make out the history of that church in itself. At present here they were, some of them, standing inside another great church, the history of which was so special, so distinct from that of any other, that no man without knowing its recorded history could possibly make it out for himself. He could see that this was a great church of the first order, and would have little difficulty in proclaiming it a monastic church. The mere appearance on one side near where they stood would imply that there was a cloistery; here there was evidence enough to show there was a cloistery in the ordinary monastic place. They might see for themselves the central tower ending in an eastern chapel; they would turn round and see that there was a west end of that great church, and see that there was something beyond that. They could see the richest and most developed Norman tracery, and beyond that there was another building of the thirteenth century. What it was no man could guess for himself without knowing that history which placed Glastonbury in one of the first places, not only in England, but in Great Britain. The cause that gave the abbey of Glastonbury its peculiar, its special character, above all other places in our island, was that Glastonbury was the one great religious foundation of the Britons which lived on through the great storm of the English Conquest. People were very fond, sometimes from an historical point of view, and perhaps oftener from a theological point of view—with which, at all events, he had nothing to do—of talking about the ancient British Church, forgetting that in the greater part of this island the ancient British Church was swept away by the coming of the Anglo-Saxons. It was all nonsense, it was foolish when it was talked of in Canterbury, York, Winchester or London; but that which was nonsense and foolish there was not so here. In Glastonbury, in this old part of Somersetshire, in this one south-western corner of England, they were in

a land which was not conquered until after the English became Christians. In this land, therefore, the religious establishments of the conquered people were respected, and Glastonbury, the greatest of all, lived on as it had been the greatest of British ecclesiastical foundations, to become one of the greatest of English foundations; it belonged alike to the conqueror and the conquered. What Exeter was amongst cities Glastonbury was amongst churches. The great Dunstan, one of the most eminent men in the early annals of the country, the minister of Edward, Eldred and Edgar, belonged to the spot on which they now stood. He was born hard by this place, and his first great preferment was to the abbey. Reverting to the architectural features of the abbey, Dr. Freeman explained at some length that the great entrance into the abbey was on the west of St. Joseph's Chapel; it was an arched gateway, furnished with turrets, battlements and a heavy machicolation. A small arched way for foot passengers and the porter's lodge adjoined. The building remained nearly entire until a comparatively recent period, when the upper part of the gateway was taken down and a modern roof substituted; the great arch was enclosed, but the small arch and the porter's lodge still remained to this day, and the ancient gateway was now the "Red Lion Inn." The speaker went on to say that supposing they were walking down the nave of Wells Cathedral from the east, when they came to the western door they came to the end of the building, and walked into the air; but at Glastonbury the case was different. There was the west door—the west front of the great church, but unlike Wells and the great majority of churches, when they got to that door they had not got to the end of the building. There was a very considerable building beyond it—the building which, in comparatively recent times, since the fifteenth century, had been known as St. Joseph's Chapel, and in earlier times still was something venerable and precious beyond almost everything in our island—the original British church. There, in a figure, were the two churches—the old church of the Britons before the English Conquest, and the church of the English. When Canute came there and signed the charter, he signed it in the *lignia basilica* (wooden church), one of those rude and primitive churches of very early times. That old British church stood on the site of the chapel which is now standing there. It was one of the most beautiful examples of the richest forms of Romanesque architecture. That wooden or wicker church was standing when Glastonbury passed into the hands of the English; it was not destroyed but respected, and allowed to remain as a highly venerable place. At some distance to the east of it stood what is now called the English church, built probably by Kenred or Ina. Certainly Dunstan built a church there, a church of stone, so that they had two churches near together, but not touching—the wooden church of the Britons and the latter stone church of the English. Those were both gone, but they had left their impress behind. There were a great number of historical associations connected with that place. They had seen at Wells that morning the church of the Bishop; here they had the church of the Abbot. They should remember that the Abbey of Glastonbury was one of the abbeys whose abbots refused to surrender at the Dissolution. After St. Dunstan, one of the greatest men England ever sent forth, many men of more or less fame had to do with that place until they came to the last abbot, Richard Whiting, who was massacred on one of the hills above them because he refused to surrender the abbey to the king. Be it remembered that, different from most other monasteries, Glastonbury Abbey was never legally suppressed, whilst the lesser monasteries were regularly and lawfully suppressed by Acts of Parliament; whilst the mass of the greater monasteries made surrenders of their property to the king, which were afterwards duly confirmed by Act of Parliament, at Glastonbury, at Reading and Colchester the three abbots of these three great houses refused to betray their trust. The real crime for which Richard Whiting died upon the hill there—it might be the Tor or it might be the hill of Avalon—was that he refused to betray the trust which had been put into his hands; and he held therefore that Richard Whiting died a martyr. After this the abbey lay several years waste and desolate until gradually dilapidated by several persons whose property it successively became. In the succeeding reign of Edward VI. it was granted to Edward, Duke of Somerset, and afterwards, in the reign of Elizabeth, to Sir Peter Carew. Since then there had been nothing to disturb the owners of the land. The stones of that venerable fabric had been taken away and used in the building of cottages and even in the

repairing of the roads, but in the hands of the present owner, Mr. Austin, he was happy to say it was not likely to suffer any further damage. Passing on to the eastern part of the church, Dr. Freeman said he had brought them to that spot not so much to speak of anything that is, but to remind them of something that was. They would now be standing under the central tower; they were, he might say, in the eastern limb, and there upon that spot, he should imagine, was the high altar. There, near or on the very spot probably where some of his hearers now stood, was the tomb of King Arthur. If they held with him that Arthur was a real person, and Glastonbury was the chief monastery of the British race at that time, it was not at all unlikely that it should have been the place of his burial. There must certainly have been some general opinion that Arthur was buried there, or the monks would have found somebody else and not Arthur. They did profess to find Arthur and his queen, and they put them in places of great honour before the high altar. It was said in legendary lore that the place was a place of perpetual summer, a place where it never rains or snows, but after the experience of the past six months they could hardly bring their minds to believe in that part of the legend. Still, be that as it may, Glastonbury would be ever memorable in history. Let them call up to themselves the east end of that church as it was in the days of its glory. Westminster and Winchester would hardly surpass it in the greatness of their historical associations. There, before the high altar, lay what claimed to be the tomb of Arthur and his queen. On each side lay two men about whom there was less doubt—two of the greatest champions of England—the two Edmunds, Edmund the Meek and the Doer of Great Deeds, and Edmund Ironsides, who fought the sixth battle in one year against Canute, who came after his murder to make what atonement he could to the fallen hero in the shape of costly gifts to his tomb; and there, behind the high altar, looked on here as a saint, and therefore enshrined in his own chapel, was the resting-place of Edgar the Peaceful, the Lord of Britain, the king who kept all England happy and peaceful. There was the group—the two warriors, and two champions of England, and the peaceful king who ruled in that age between the two. Their tombs stood there; they were now swept away, but his hearers could call them up in imagination. They could see with their own eyes the royal tombs gathering round the apse at Westminster; with the eye of imagination they could call up the no less venerable royal tombs which, till the hands of the destroyer came upon them, stood round, before and behind the high altar at Glastonbury.

THE CHAPEL OF HOLYROOD.

INTEREST in, or criticism of, the proposed restoration of the ancient chapel at Holyrood Palace is as yet largely in abeyance, for the reason of an expected pronouncement by the trustees of the late Lord Leven and Melville, after consultation with the Crown authorities and the designated architect. The magnitude of the task of restoring the whole of the magnificent abbey will be apparent to none more than to Mr. Thomas Ross, but it is understood that the reconstruction in contemplation by the testator refers only to completing the ruined and partly demolished walls and interior, "putting into repair and restoring the chapel at Holyrood Palace, so that it can be used as a chapel for the Order of the Thistle." It may be anticipated that the trustees and Crown authorities alike will seek to take the nation into their confidence regarding any restoration of the historic ruin as a habitable chapel, or even what is equally important, should it be decided upon, trying to arrest the progress of "Time's effacing fingers." The enlightened policy of the present Office of Works, at whose head is Mr. Oldreive, the distinguished place which Mr. Ross holds as an authority upon Scottish ecclesiastical architecture, together with the eminence of Lord Leven's executors, may be relied upon to stop short of any improper restoration.

It is understood that Mr. Ross has had plans prepared for the restoration of the abbey, and these have been submitted to Sir John Stirling-Maxwell and Lord Balcarras, the trustees mentioned in the bequest of 40,000*l.* Until the Royal sanction has been obtained, however, it is thought to be premature to publish the details of the restoration.

Inquiry among Edinburgh architects, says the *Glasgow Herald*, revealed the prevalence of considerable difference of opinion on the subject. The members of the profession do not, however, readily disclose their views. The position,

they feel, is a somewhat delicate one, as an expression of opinion against the feasibility of the scheme might be regarded as prejudicial to Mr. Ross, who is to be entrusted with the work should restoration be sanctioned. But so far as opinions could be gathered they were rather against the proposal to restore the chapel, and certainly against any attempt to carry out the work at the figure laid down by the late Lord Leven (40,000*l.*), while there was practical unanimity that it was not a project to be entered upon without the most exhaustive examination and inquiry.

An architect who is in a position to speak with authority said that, of course, until the trustees and the Crown authorities had come to an agreement the work of restoration could not be proceeded with, nor was it possible to anticipate what their decision might be. But it was permissible to point to one or two difficulties in the way of carrying out the wishes of Lord Leven. In the first place, he considered the bequest was totally inadequate. If the restoration was to be a thorough one, and was to be carried out as it should be, the cost would probably be three times 40,000*l.* The ruin was a mere fragment of the original building, the foundations of which extended east, north and south far into the gardens of the palace. Then the condition of the ruins is such as will demand the greatest care in any work of restoration. A great part of it is far out of plumb and leaning over, and a considerable portion may have to come down. The question, therefore, which arises at the outset is where the additional money is to come from, and if the Government or the public in a private way will assist. If the partial restoration was gone on with it would probably be unsatisfactory, and altogether this gentleman regarded the matter as a very complicated business. There would be, no doubt, every desire on the part of the Government officials to make the most of the legacy, but, as had been said, it was totally inadequate for the purpose for which it was given.

Another gentleman, whose position among Edinburgh architects gives his opinion some weight, said the scheme was not feasible, and in saying that he was looking at the matter both from a practical and a sentimental point of view. It was, he said, a crying shame that for a whole century nothing should have been done to prevent the building decaying into its present dilapidated condition. Now it was too late, and the sum mentioned was quite insufficient to restore it. All we could do was to preserve what remained as carefully as possible. The first thing that would probably be attempted in any restoration scheme would be to put a roof on the chapel, but that would mean pulling down a great deal of the work already existing, in order to make it sufficiently stable. But there was the other objection, that any restoration work would sweep away all the sentiment which attached to the ancient building. In its restored form we would have a building with or without merit, according to the skill with which the work was done, but to those who loved the place uninteresting. A warm sentiment gathered round the walls of the graves, and to encase the old walls in new stonework would rob it of all that made it what it was. It was a national memorial which commanded universal interest, and was not to be lightly tampered with.

Something of the same view, though not quite so categorical, was expressed by an eminent member of the profession in Edinburgh, and one who has himself been identified with some important restoration work. His feeling was that the scheme was one calling for the fullest investigation before being embarked on. It might be that the process of decay had proceeded to such a degree as to make any scheme of restoration impracticable. But, on the whole matter, he had the feeling that the project was almost too big for anybody to undertake.

On the other hand, a prominent and successful architect, who also has carried through some big restorations, stated quite confidentially his opinion that the scheme was practicable, and if the restorer approached his work in the proper sacred spirit, he had no doubt the best results would follow. Mr. Ross, with his experience, ought he said to be able to do the right thing, though he ventured the opinion that it was too big a work for one man, and expert assistance might be necessary.

A meeting of the Scottish Ecclesiological Society (Edinburgh district) was held on Saturday in the chapter-house of Restalrig Church. Mr. Thomas Ross described the chapter-house, which is at present in a deplorable condition.

Bishop Dowden, in moving a vote of thanks to Mr. Ross, alluded to the bequest by the Earl of Leven and Melville for the restoration of Holyrood Chapel. He thought it was

particularly satisfactory that the work was to be committed to the hands of so competent, so learned and so historic an architect as Mr. Ross. One could only hope that the King would be wise enough, and good enough, to give his assent.

The Rev. Dr. Sprott, in seconding the vote of thanks, said he was greatly rejoiced to see the announcement in the papers the other day. He regarded Holyrood as a national monument, and thought that all the Churches should be interested in its restoration. As to the purpose to which it might be applied, one could imagine various things, but he should not think that there would be anything in connection with the restoration to offend anybody in the country. He hoped the work would be carried out, and was greatly rejoiced to know that Mr. Ross, who knew every stone in the building, had been selected for the purpose.

Mr. Ross said:—I thank you, my Lord Bishop and Dr. Sprott, for the kind compliment you have paid me. I assure you that I appreciate it very much. I join with you in hoping that Holyrood may be restored, that the King will give his permission for it, and, if he does so, well, I will do the best I can for it. I think Holyrood can be restored. That does not seem to be the opinion of my professional brethren in Edinburgh. No names are mentioned. But it would appear to be their pretty unanimous opinion that Holyrood is past praying for. Well, that is not my opinion, and I have the opinion of a gentleman who has probably had more practical experience of the fabrics of large cathedrals than any other man in this country, or, at all events, equalled by few, that it can be restored. And that is my decided opinion. We are also informed that it will be necessary to take Holyrood down before it can be restored, or pretty much to take it all down. Well, I do not see that that is necessary. I think the walls are quite competent to bear what they once sustained, and in my opinion there is a good deal of error in regard to the reason why Holyrood came to its present condition. It would not be easy going into that without sections and without drawings, but I am quite confident that there is an error in regard to the alleged reason that brought about the ruin of Holyrood. I feel confident of that, and that the walls are quite competent of sustaining a stone roof. I also believe that that will add very greatly to its stability and strength, although it brings a weight on it. I suppose I need say no more, but just that I hope the work will go on.

Dr. Dowden: A question is suggested whether 40,000*l.* was enough to do it.

Mr. Ross: That was also taken up. They talk of Holyrood, what is standing, being a portion of the nave, and that the transepts and the chancel have entirely disappeared. Yes, 40,000*l.* will put the fabric wind and watertight, and probably something more, but it will not build the entirely vanished part.

Dr. Dowden: There is no proposal to that effect?

Mr. Ross: No.

Dr. Dowden: The primal object being a chapel for the chapter of the Knights of the Thistle, the rest of the building does not require to be considered.

Professor Cooper: The 40,000*l.* means simply the making it wind and watertight, and the furniture and decorations must come some other way?

Mr. Ross: Yes, they will have to be provided otherwise.

Professor Cooper: It has been said that you will destroy a beautiful ruin. I do not think it is beautiful in its present condition. It always strikes me as one of the most dismal and sad places to be seen at present. And while there is a sadness in some other churches, such as at Melrose and Dryburgh, there is also a great deal of beauty, though we cannot bring them to any use. But this is to restore a church which has been used long after the Reformation. It is disgraceful that there should not be a chapel royal in Scotland that the King and his family can use if they were living in the palace. It is a great blot upon us that we have not anything of the kind.

ECCLESIASTICAL DILAPIDATIONS.

AT the diocesan conference of Peterborough the report was submitted of the committee appointed in October 1904 to consider and report on ecclesiastical dilapidations, with special reference to any recent recommendations and suggestions of the Houses of Convocation, the Houses of Laymen, or the Representative Church Council. The committee having carefully considered the suggestions, adopted as the basis of their report the three resolutions which were moved by the Bishop of Oxford, seconded by

the Bishop of St. Albans, and carried in the Upper House on February 22, 1906, as principles upon which they considered that a large amount of practical agreement had been reached as to the direction which amendment of the existing law should take, merely adding a few words to make the meaning more explicit. They thought it wiser to avoid details as far as possible until the draft of a Bill which, by a further resolution, the Upper House directed its committee to prepare, has been submitted for consideration. The resolutions were as follows:—

1. That a periodical inspection of all ecclesiastical property subject to dilapidations should be compulsory, and that such inspection should be made at least every five years.

2. That an annual payment, estimated upon the basis of this periodical survey, be required to be made by all incumbents to some appointed body.

3. That diocesan surveyors be paid by salary and not by fees, such salary to be met by proportional yearly payments from each incumbent.

While considering, however, that the true solution of the difficulties which at present surrounded the question lay in some such alteration of the existing law, the committee could not dismiss from their minds the almost greater difficulties that stood in the way of speedy legislation. They thought it well, therefore, to consider what further improvements seemed possible under the existing law, which might tend to diminish the hardships and difficulties which must occur when buildings were allowed to fall into disrepair.

The following resolutions were to be understood as suggestions in case of undue delay in obtaining fresh legislation on the lines indicated above:—

1. That it is desirable that Sections 12, 22 and 23 of the Dilapidations Act, 1871, relating to the duties of the patron, the rural dean and the archdeacon, be more regularly acted upon.

2. That to this end it is desirable (a) that the attention of patrons should be called to these sections in the Act; (b) that the rural deans should be requested to report to the bishop, through the archdeacons, on the Church property in their deaneries, and that the archdeacons should make a general report to the bishop.

3. That in the opinion of this committee it is advisable that a consultative committee, consisting of members from each of the three archdeaconries, be elected by the Diocesan Conference, or nominated by the bishop, to advise the bishop in difficult cases when called upon by him to do so.

4. That it is desirable that the attention of the clergy should be called to the "Other Benefits Fund" of the Clergy Pensions Institution, which affords facilities for making annual contributions towards future liabilities for dilapidations.

PROFESSOR HERKOMER ON ART STUDIES.

AT the private view of the annual exhibition of the Southampton Art Society Professor Herkomer was present, and he was asked by the President to give a few words of advice to the members. Professor von Herkomer said he had not come prepared for any lecture, and did not think he was going to teach them much. He did not come there as a critic, but as a friend. Their Society was celebrating its coming of age, as the present was the twenty-first annual exhibition. Any society that could hold out twenty-one years had got some stamina, and it was a difficult thing to keep up an annual exhibition, whether it was a small one or a big one like the Royal Academy. Difficulties increased rather than decreased, but he saw signs that they were energetic, and if they looked around they could get professional artists who had had to do with Southampton, and who naturally had a soft spot in their hearts for the place, to send to their exhibition, though they must not forget, as in his case, to invite them. He would most willingly send on another occasion, and they should get together more of the works of those outsiders who formerly belonged to that place, and who would do what they could, he was sure, to give the exhibition a little éclat, if they wanted that. It was a curious thing, but the amateur—he did not use the word as a term of opprobrium—who had just skill enough to paint the scene that he loved in a tangible, somewhat artistic way was a very happy person. The amateur had no responsibility; his career was his own, and if he did not sell his work he could still pay his rent, pay for his living and pay for his children's

education. He could go from subject to subject, and paint what he liked and loved, irrespective of what anyone thought of it. That was a thing the professional was not quite capable of carrying out, he (the speaker) did not care who and what he was. The public saw that he was under the necessity to sell, however much he might love to paint, something that he could not dispose of. That was not to the advantage of the artist or to his happiness, but happy sketchers could sit down where they liked, make their sketch, go home and look at it before they dressed for dinner and after dinner and when they got up in the morning. They could put hours into it, and it always seemed better than it really was. Their President had told them of the advantage of seeing their works on the wall, but if they wanted to know real misery he would recommend them to the professional artist for the first hour or two on hanging day at the Royal Academy, and it was not until after lunch and refreshment that he congratulated himself that his work was not so bad as he thought it. The speaker regretted his inability to sketch, and said he was brought up in the school of Fred Walker, who was then as much beyond his age as some of the very advanced artists were nowadays. He was a pioneer in his way, and his idea was to make a picture of everything he touched. In painting a picture with a figure in it, the speaker said the figure should be painted first and the landscape should be copied afterwards, the whole thing being evolved together. He congratulated amateurs who had the skill to sketch, because they enlarged their lives, enlarged the pleasures of their lives and their seeing powers, and he hoped it enabled them to see merit in the poor professional all the better. Amateurs—it was a term he did not like, as personally he only knew good, bad and indifferent art, he did not care who had done it—had a charm that they could go on with it, and but for societies like their own they would have very limited possibilities of judging their art. It was well to have their works on a wall, as they looked different to what they did on an easel or in their own studios, and even in the Royal Academy they found that a picture which looked bad when leaning against the wall, the moment it got on the wall it was a different thing altogether. He was glad to see there that they had still a love for England, which was going out as fast as it possibly could. There was a tendency in modern art towards a terrible decadence, and among other things, much work that was sweet and lovable was condemned by a certain cult as namby-pamby. He had seen a collection of pictures lately which he would have taken to be a huge joke, and not to be regarded seriously, if he had not known that the painters had done better work before. He would ask those who lived in that most charmingly artistic town to paint Southampton and its surroundings. There were corners and places in Southampton of which anything could be made. He had been charmed, and it came back fresh to him when he came to see some of the people there. There was no necessity to go so far as Mr. Short's home at Lyndhurst, where he did admirable work, but within three miles of the town he would like to see them paint Southampton. It would be quite interesting, and it would make them look for things that now escaped their eyes. As far as the exhibition was concerned, he was surprised to find where so many did not profess to paint that there was such a very creditable show, and he would urge them to get all the outsiders they could to come in to make the exhibition worthy of being there.

EARLY GREEK PORTRAITS.

THE earliest portrait on record by any great painter was neither of hero, philosopher nor athlete, but of Elpinice, the daughter of Miltiades and the mistress of Polygnotus, who painted her portrait as Laodice, one of the daughters of Priam, in his famous picture representing the "Rape of Cassandra," in the Pæcile at Athens. This picture was executed about 463 B.C., when Elpinice must at least have been thirty-five years of age. Dionysius of Colophon was also a distinguished portrait-painter and celebrated for his excessive finish. Nicephorus Chumnus, the grammarian, describes Apelles and Lysippus as making and painting "zosas eikonas kai pnoes mones kai kineseos apoleipomenas," being likenesses only wanting breath and motion. For one of his portraits of Alexander he received twenty talents of gold (5,000*l.*), which was measured, not counted out to him. He also painted the portraits of Campaspe and Phryne in the character of Venus, taking the face from Campaspe and the nude figure from Phryne. Speaking of

Apelles, Pliny himself relates in his 36th book that "he painted portraits so exact to the life that one of those persons called Metoscopi, who divine events from the features of men, was enabled, on examining his portraits, to foretell the hour of the death of the person represented." And this monstrous story Pliny apparently accepts. At all events, he does not question it. Parrhasius, "the most insolent and arrogant of artists," says Pliny, "painted a portrait of himself and dedicated it in a public temple to Mercury, and though the Athenians had publicly proceeded against Phidias for so doing, they allowed it to Parrhasius, thus plainly showing that the dignity of sculpture was higher than that of painting."

THE FIRE AT THE MERCHANT VENTURERS' COLLEGE.

SIR,—Very inaccurate and misleading accounts of the recent fire at the Merchant Venturers' Technical College, Bristol, having been published by the local Press and also by several of the London newspapers, we shall be glad if you will kindly give publicity to the following facts:—

1. The floors to the whole of the front portion of the building between the great hall and Unity Street (referred to in the early reports of the fire as being of fireproof construction) were in reality entirely of pitch-pine beams and small wood-joists and ceiling fillets supported upon iron girders.

2. There was no fireproof separation between the great hall and the classrooms, &c., above it, these being also constructed with pitch-pine beams, wood-floor joists, &c., as above described.

3. It was only at the first-floor level that the concrete floor construction was used to any great extent, and in no instance has the fire extended below the fireproof portion of this floor.

4. The floors constructed with timber are entirely burnt out, with the exception of the first floor between the great hall and Unity Street, and this is greatly damaged by fire and falling materials. This floor was erroneously referred to in some of the early published reports of the fire as a fireproof floor.

5. The whole of the fireproof floors are constructed on the "arched concrete" principle and remain intact, and have not only resisted the fire, but also the severe strain of impact from the falling timbers, &c., of the upper floors and roof. Noteworthy instances of the reliability of this form of construction are to be found in the concrete floor over the end gallery of great hall and the side gallery to the hall itself. These floors would be, in the first instance, attacked by the fire from above and piled with falling debris, then as the wooden floors collapsed the soffits would in turn be subject to the fire raging below, and this severe ordeal they safely withstood and remain in place intact.

6. At the east end of the building a large flight of stone stairs is practically destroyed above the first floor, and was perhaps not badly described in the fire officials' report as having "exploded." As a contrast to this, a main flight of stairs at the west end of the building, constructed in concrete, and with stone finishings to treads and risers remains intact from top to bottom. In conclusion, we may say that this building, constructed as it is partly of combustible and partly of fire-resisting materials, forms a splendid object lesson, and affords an excellent testimonial to the efficiency of the latter method of construction.—Yours faithfully,

DENNETT & INGLE.

24 Queen Anne's Gate, London, S.W.:

October 16, 1906.

P.S.—We enclose herewith copy of our engineer's report made after a visit of inspection to the site with a well-known architect, and also cuttings from the original accounts in the Press and corrections of same, so far as they have at present been published.

[Copy.]

October 11, 1906.

Dear Sirs,—By courtesy of the architects to the Merchant Venturers' Society, and the Sun Fire Office, who are at present in charge of the building, I made a thorough examination of these premises recently partially destroyed by fire. I find that (with the exception of a small area on

the lower floor next Unity Street) the floors constructed of wood beams and wood joists supported by iron girders are entirely destroyed, although the girders themselves remain in position, with here and there portions of the charred timber attached to them. The whole of the concrete arching shown on your plans, and described in the specification as having been executed by you under contract in 1882-3, I find is all intact, and its efficiency appears to be in no way impaired. At the first-floor level, which is the highest floor in the building where concrete flooring was used to any great extent, I find that this fireproof separation has effectually answered its purpose, and all the valuable machinery beneath this floor appears to be quite intact, although it may possibly have suffered injury from water. The concrete floor of the great hall is covered with debris from the falling woodwork from floors and roof above, but it has successfully resisted both the heat and the impact from falling materials. The underside of this floor, which consists of a series of concrete arches, shows no sign of damage beyond stains in places where water has percolated through to the ceiling.

On the upper floors, where there are some isolated and comparatively small areas of concrete flooring adjacent to timber constructed floors, I find that the wooden portions are entirely burnt out, but the concrete portions still remain in place, and appear to have suffered no damage, although in these cases the concretework has been exposed to the fire from below as well as from above. A noteworthy instance is a portion of concrete flooring over the end gallery of main hall, which not only remains in place, but by diverting the course of the flames has actually preserved to a great extent a wooden-built gallery immediately beneath it. The side gallery to the great hall, also constructed in concrete, remains intact and supports a considerable quantity of debris; and here, again, although the fire was raging below as well as above, the wood panelling on the wall beneath the gallery remains in a good state of preservation. A large stone staircase at the east end of the great hall is practically destroyed above the first-floor level, but at the west end between the hall and Unity Street a flight of stairs the whole height of the building, constructed in concrete and having stone finishings to risers and treads, appears to have suffered no damage at all. The conclusion I have come to is that, had the fire originated in the basement or ground-floor storeys, the concrete arching would undoubtedly have been the means of isolating it; but starting as it did from the top and immediately above the wooden floors, there was nothing to check its progress until the concrete floor at the lower level was reached. Had the concrete floors been used throughout instead of to such a limited extent a fire of any magnitude would have been quite impossible, as an outbreak could have been easily restricted to that portion of any one floor upon which it might have occurred.

With regard to the statements in the local Press, I have in the absence of the editor of the *Western Daily Press* gone thoroughly into the matter with a member of the editorial staff. He expressed himself as satisfied that the report as to the concrete failures was proved by subsequent events to be incorrect, and he assured me that corrections should be published in early editions of their papers.—Yours faithfully, (Signed) Frank Wilshire (Assoc.M.Inst.C.E.). Messrs. Dennet & Ingle, 24 Queen Anne's Gate, Westminster, S.W.

PRESS NOTICES.

"THE DAILY TELEGRAPH," Wednesday, October 10, 1906.

Original Report.

"The upper floors of the doomed building were ablaze from end to end long before the resistance of the fireproof flooring gave way enough to involve the great hall. At length its vaulted roof became alight, and it suffered extensive damage, though the pinnacled walls—which are of great thickness and solidity—remained standing firm."

Tuesday, October 16, 1906.

Corrected Report.

"A surveyor's examination of the damage done by the destructive fire at the Merchant Venturers' Technical College, Bristol, shows there was no failure of any fireproof floors. It is pointed out by the contractors for the fireproofing work that 'it was only at the first-floor level that the concrete floor construction was adopted to any great extent, and the fire has not, in a single instance, extended below the fireproof portion of this floor. The building,' add Messrs. Denuett & Ingle, 'being constructed

partly of combustible materials and partly of fire-resisting materials, offers an excellent testimonial to the efficiency of the latter method of construction.'"

"THE WESTERN DAILY PRESS," Tuesday, October 9, 1906.

Original Report.

"A strange thing about the whole affair is that the floors were built on the fireproof principle. It was an uncanny sight to see these go before the fierceness of the fire. They seemed to crack, and then in no time burst into a red-hot glow. . . . Above the gallery the carved oak ceiling remained—a sample of that which had gone. The side gallery had outlasted the ordeal wonderfully well, but was piled with wreckage; below it the boards on which are inscribed many names prominent in the college history had also escaped destruction. The range of classrooms between the hall and Unity Street were in ruins. They had had concrete floors surfaced with wood blocks."

"THE WESTERN DAILY PRESS," Friday, October 12, 1906.

Corrected Report.

"We have been asked by a well-known architect to publish the following statement:—

"Some surprising statements in some recent issues of your paper, having reference to the fireproof and concrete floors at the above building, have led me to investigate and ascertain the facts. Amongst the statements I refer to are the following:—(1) In your issue of the 9th inst. you state that 'A strange thing about the whole affair is that the floors were built on the fireproof principle. It was an uncanny sight to see these go before the fierceness of the fire,' &c. &c. (2) In your issue of the 10th inst. you state 'That the range of classrooms between the hall and Unity Street were in ruins. They had had concrete floors surfaced with wood blocks,' &c., &c. (3) In a leading article in your issue of the same date you refer 'to the circumstance that the concrete floors and iron girders collapsed under the excessive heat,' &c., &c. (4) In your issue of to-day you refer to certain holes in the concrete floors. I have made a careful personal investigation of the state of the ruins, and find as follows:—(1) No concrete floors have collapsed, and, so far as I can see (and I was able to see almost the whole of the concrete flooring originally put in), the concrete floors are as good to-day as they were the day they were erected. (2) Wherever concrete floors were adopted the fire was arrested. A remarkable instance of this is the case of the gallery at the back of the great hall. The roof of the hall, being of wood, was entirely destroyed, but above the gallery was a piece of fireproof flooring. This floor is intact. A considerable portion of the ceiling underneath it remains; also the wood gallery underneath this ceiling, although it had the fire playing against it from the hall, had not been destroyed, as it would have been had there been no concrete floor above it. The side gallery, which is of concrete, also formed a complete protection from the falling debris, for even the wood panelling to the side of the hall below it has not been destroyed. No better instance than the present can be afforded of the value of properly constructed fireproof floors. It is only to be regretted that these were used to a comparatively limited extent throughout the building. (The row of classrooms you refer to in the quotation above had wood-joisted floors.) I wish to clearly explain my objects in writing to you thus. I was not architect for the building, and have no connection with it whatever, but from a professional point of view I am naturally interested in the subject of fireproof floor construction, and regard it as unfortunate that the public should have a wrong impression as to its practical value. Also I feel strongly that those who were responsible for the construction of the building should receive fair play, and I consider it is due to them that you should make an early correction of the statements to which I have referred above, and am quite certain that you will be only too happy to do this. I may mention that what I think perhaps misled your reporters may have been the fact that on one of the upper floors of the building a number of small pieces of broken concrete are lying. This concrete was no part of the fireproof floor construction, but fell because it was carried merely by wood-joists, which were destroyed."

"THE TIMES," Wednesday, October 10, 1906.

Original Report.

"The fire broke out in the top storey and soon spread to the second floor. The main portion of the building was of pitch-pine, and it burnt with such rapidity that within ten minutes the whole structure was in flames from end to end."

GENERAL.

Mr. G. F. Bodley, R.A., F.S.A., will on October 21 leave for Washington, by the invitation of the Dean and Chapter of the cathedral in that city, to prepare preliminary plans for a new cathedral. The cathedral will, it is stated, be one of the largest in the world, and is to cost between one and two millions sterling.

Messrs. H. Burke, of Toronto; **A. Chase**, of Montreal, and **D. Ewart**, chief architect of the Department of Public Works, have been appointed a jury to pass on the competitive plans for the new Canadian Government Buildings at Ottawa. Prizes of 8,000 dols., 4,000 dols., 2,000 dols. and 1,000 dols. have been offered in this competition, which is open to all Canadian architects.

A Copy of **Raphael's Cardellino Madonna and Child** was offered to St. John's Church, Windermere, on the condition that it should be hung in the church. At a vestry meeting last month it was decided to accept the picture and to apply to the Chancellor of the Diocese for a faculty. The application has since been withdrawn owing to some opposition.

The Cottage Hospital at Crieff, of which we published an illustration a few months back, was opened last week by **Mr. W. Younger**. The architect, **Mr. E. C. Maidman**, of Edinburgh, delivered an address, in the course of which he said that the extras only amounted to 12/.

A Report has been prepared by **Mr. C. Stewart** and **Mr. J. A. Ogg Allan**, architect to the Aberdeen School Board, on a proposed technical college for northern Scotland. The building would cost about 62,000/., while a Fisheries Institute would cost an additional 20,000/. The scheme comprises schools of architecture, engineering and artistic crafts.

Mr. F. W. Dixon, architect, of Manchester and Southport, has accepted the invitation of the Southport Town Council to act as mayor for the coming year.

The Architect for the new County Council schools on the Harwoods estates, Watford, has been requested to provide bath-rooms in the plans. Each of the departments will have a hot and cold-water bath.

At a Meeting of the Liverpool Corporation housing committee last Friday the chairman stated that the Chilean Government had recently sent over to this country to obtain plans of workmen's dwellings. The Chilean Government's representative in London consulted the Local Government Board in the matter, and was referred by them to Liverpool as being the best place from which to take an example. The Consul-General added, "I think this reflects great credit on the city." The Chilean Government intend applying all the moneys subscribed for the relief of victims of the recent earthquakes to the construction of model dwellings for poor people rendered homeless.

The Bishop of Manchester, in the course of his charge to the Bolton Rural Deanery, said:—"The clergyman's study is not the place where parish documents should be preserved. Every church ought to be furnished with a strong fireproof chest, large enough to hold a series of parish records, and I shall not in future sanction the plans of any church which do not show such a safe as part of the original fabric."

The Candidates for the membership of the French Academy of Fine Arts, rendered vacant by the death of **Jules Breton**, are the following painters:—**MM. Chartran**, **Commerre**, **Gervex**, **La Touche**, **Tony Robert-Fleury**, **Raphaël Colin** and **Toudouze**.

At **Westminster Abbey** on Saturday the 542nd anniversary of the opening of the new choir of Westminster Abbey, and of the translation of the remains of **Edward the Confessor** to their present resting-place, was celebrated.

Mr. F. Gorringe Killick, surveyor to the Finsbury Borough Council, has been the recipient of a presentation on behalf of the staff, to celebrate the completion by him of twenty-five years continuous service.

At a County Meeting at Winchester on Monday it was unanimously decided to organise a pageant in or near Winchester in 1908 in aid of the cathedral restoration. **Mr. F. R. Benson** outlined a scheme embracing a period from pagan times to the Civil War, and suggested St. Cross as the most suitable site. Fifteen hundred pounds has already been guaranteed.

M. Henri Bouchot, the director of the department of engravings in the Bibliothèque Nationale, Paris, died a few days ago. In addition to special and descriptive catalogues, he wrote volumes on Callot, Clouet and other artists.

The Westminster Library Committee have instructed **Mr. J. Murray**, architect, to report on the suitability of **Caxton Hall** to serve as a central reference library. It is also desired to transfer to it the branch library in **Great Smith Street**.

An Exhibition of Paintings by Russian artists in the **Grand Palais, Paris**, was opened on Monday by **M. Fallières**.

The Royal Society of British Artists on Monday elected **Mr. Louis Grier** and **Mr. Edwin Noble** as members. There were sixty-six candidates.

A Bronze Statue erected in the **Elder Park, Govan**, by the inhabitants to the memory of the late **Mrs. John Elder, LL.D.**, who was a life-long benefactress to the community, has been unveiled. It is the work of **Mr. A. McFarlane Shannan, A.R.S.A.** It shows the lady in a sitting posture in a meditative mood and wearing the academic robes of a Doctor of Laws. It stands upon a pedestal of dark grey Scotch granite.

Mr. Colson, in a report on **St. Mary's Church, Cowes**, expressed the opinion that the church is in a serious condition, and that something must speedily be done to avoid disaster. He recommended the shoring of the galleries till permanent work could be done. In a further letter the architect recommended the closing of the galleries. The vicar says that the galleries have been closed in accordance with the advice given, but he believes the church is in a safer condition than it was years ago. What he fears is not that the church will suddenly collapse, but that perhaps a piece of brick might fall upon some one during a service and cause a panic. It has been decided to call in the opinion of another architect.

At the Autumn Meeting of the Association of Municipal Corporations, which will be held in London on Friday, the Lord Mayor of Manchester will submit resolutions to the following effect:—(1) "That Parliamentary powers should be conferred on Town Councils and other local authorities to enable them to control, by means of town extension building plans, the laying-out of all land within the boundaries of the towns, or which may hereafter be incorporated." (2) "That it is desirable that some central authority should be empowered to confer with local authorities in regard to the plans for contemplated building upon the areas between contiguous towns." He will also move:—"That the proceedings of the conference held in Manchester on October 11, 1906, meet with the approval and concurrence of this Association, and that the same be referred to the Council with a view to their taking action."

In the Manchester Municipal School of Art the number of individual students enrolled for the session 1905-6 was 883 (472 men and 411 women), including 185 elementary school teachers attending the new course of drawing on Saturday mornings. Of the enrolments 410 are day and 473 evening students. In the preceding session the numbers were respectively 221 day and 446 evening students. The extension of the school on the plot of land at the south-west corner in **Ormond Street** has now been completed, making better provision for drawing from the life and in architecture. The annexe will shortly be opened by the Lord Mayor.

A Competition was recently organised in South Africa to obtain designs for a memorial to the men of Rand regiments who fell during the late war. The selection committee, the technical advisers of which were **Messrs. Medley and Watson**, nominated by the Transvaal Institute of Architects, set apart six of the designs sent in for the memorial, but could not recommend the adoption of any of the designs submitted owing to the estimated cost for the completion of the work being in excess of the limits laid down in the competition. It was recommended, however, that the authors of three of the designs should be asked to justify their estimates, and in the event of their being able to do this to prepare more elaborate drawings and submit designs in detail. Should they fail to do so it was suggested that the competition should again be thrown open according to the stipulations to be drawn up under professional advice.

Messrs. Simpson & Wilson, of Glasgow, have been appointed engineers for the works of preservation of the **Auld Brig, Ayr**. An archæological expert will aid them.

The Alloa Municipal Buildings were partly destroyed by fire on Monday night.

The Opening Meeting of the session of the Auctioneers Institute will be held at 34 Russell Square on Wednesday, October 31, at 7.30, when the president, **Mr. Henry D. Buckland**, will deliver the inaugural address.

The Architect.

THE WEEK.

It is not often that there are imitators of Mr. CARNEGIE in the towns which he has enriched with libraries. It is therefore imperative to put on record an instance where a rival has been discovered. Mr. CARNEGIE promised to give the town of Worthing 5,000*l.* for the erection of a free library, and when it was found that the estimated cost was 5,500*l.* he increased his gift to that extent. When that fact was announced, an anonymous benefactor offered, through a firm of local solicitors, to provide the whole cost of erecting an art gallery and museum for the town upon the following conditions:—"That the plans and estimates for the building were approved by the donor; that the building should be erected simultaneously with the free library, and that it should never be opened on Sundays." It is needless to say that the Town Council gladly accepted the offer. The condition by which the gallery must be closed on Sundays will not be approved by all visitors to the watering-place. There, as elsewhere, rain appears to be under no command about ceasing on Sundays, and it would be an advantage to be able to look at pictures and collections in a museum rather than to be imprisoned in confined lodgings.

We referred last week to the proposals of the Building Act committee of the London County Council relating to an alteration of the Tribunal of Appeal and the remuneration by salary of district surveyors. A later report of the committee supplies more information. In 1904 it was resolved that provision should be made in the next Bill for increasing the number of members of the Tribunal of Appeal from three to five, for one member to be appointed by the Council, but not to be a member of the Council, and for the fifth to be a barrister of not less than ten years' standing, to be chosen by the other four, and to act as chairman of the Tribunal; also "that no architect or surveyor practising in London shall be eligible for membership of the Tribunal, and that the powers of the Tribunal shall be restricted to the limitations of the section under which the appeal is made." The part of the Bill containing the proposals was, however, withdrawn. The Building Act committee have, since the recent decision respecting the general line of buildings, come to the conclusion "that the interests of the general public cannot be considered to be sufficiently safeguarded by a Tribunal consisting of three members, two of whom are appointed by the professional bodies whose interests are closely connected with those of the owners of land and property, and this objection is intensified when, as is now the case, the persons appointed by the professional bodies are architects and surveyors in active practice." Several proposals have been considered by the committee, one being that all appeals should go to a county court judge or judge of the High Court sitting with two professional assessors or advisers, or should be settled by arbitration. The committee hope the Council will deal with the subject without delay. It is also recommended that legislation concerning the payment by salaries of district surveyors should be sought as soon as possible.

THE Congested Districts Board for Ireland are about to appoint several clerks of works and land surveyors in connection with the rearrangement of estates and the execution of land improvement works. Selected candidates for the position of clerk of works will have to go through an examination. But no one will be nominated who has not engineering qualifications, except those

who can show that they have had practical experience in land surveying, mapping, levelling and execution of land improvement works. Those who are selected after examination possessing engineering qualifications, and who have been for at least three years engaged at the practice of their profession, will be offered salaries commencing at 150*l.*, rising by annual increments of 6*l.* to 180*l.*, with allowance for subsistence when absent on duty outside a ten-mile radius from headquarters, with a bicycle allowance of 30*s.* per month. Candidates may also be selected after examination without engineering qualifications, but who have had practical experience in land surveying, &c., as above, and those who have engineering qualifications, but who have not been engaged for three years in the practice of their profession, will be offered salaries commencing at 120*l.*, rising by annual increments of 6*l.* to 150*l.*, with a subsistence allowance when absent from headquarters, and a bicycle allowance. The age of candidates is not to exceed forty-five years. The land surveyors are to be competent for fieldwork and for mapping accurately and neatly as well as computing areas. A limited number of applicants will be selected for examination, and if they pass will be offered a salary commencing at 120*l.*, with annual increments of 10*l.* to 180*l.*, together with specified allowances. A limited number of candidates who have not had experience in fieldwork, but who from their examination show that they possess sufficient theoretical knowledge to be readily trained as surveyors, will be offered salaries commencing at 90*l.*, rising by annual increments of 6*l.* to 120*l.* All applications to be sent prior to the 30th inst., and surveyors' applications should be accompanied by specimens of draughtsmanship.

WHEN we find an ancient city like Coventry is forced to build a row of shops on the ground storey of the proposed municipal buildings in order to meet an outlay of 30,000*l.*, the builders of the Capitol at Harrisburg, in the State of Pennsylvania, must be envied, for the expenditure has been about 13,000,000 dols. The sum granted to meet the cost was 4,000,000 dols. But when American buildings are in progress a vast number of improvements appear to be required. The wainscoting, wooden mantels, &c., have amounted to 890,000 dols., the marble mantels 278,000 dols., the parquet flooring 140,000 dols., and an eighth floor cost 303,693 dols. In fact, the extra floor has cost double the sum required for the proposed Coventry town hall. The architect has received 235,000 dols., and there is still a sum of 104,585 dols. owing to him. Mr. ABBEY, R.A., is to receive 222,887 dols. for mural art painting. The cheapest work connected with the building has been the sculptor's, for he will have to give thirty-two colossal figures and groups for 100,000 dols.

THERE is such a supply of technical ability in the market, we suppose public bodies consider they have a right to take advantage of it by paying for it on terms which a few years ago would be considered absurd. Among the properties possessed by the Glasgow Corporation is one known as the Riddrie estate. It is proposed to utilise the land as sites for small self-contained dwellings, having from three to five apartments. For the laying out of the estate the Corporation offered a premium of 50*l.* It is quite possible that with so modest a temptation several clever men would enter into the contest. But would it be worthy of so important a city as Glasgow to seek for skilled labour on such terms? It was proposed to increase the reward by offering 100*l.* as a first premium. But that was considered to be too much extravagance, and eventually the premiums were fixed at 75*l.*, 50*l.* and 25*l.* It is to be hoped the names of the unsuccessful competitors will not be known, for the failure to carry off a prize of 25*l.* would not enhance a man's reputation in Glasgow.

MANCHESTER CATHEDRAL.*

IF considered historically there is a vast difference between St. Davids Cathedral, which we have represented by numerous plates, and Manchester Cathedral, which we begin to illustrate. One goes back to the sixth century, and some would say to a still earlier period, while the church at Manchester is no older than the fifteenth century, and was not constituted a cathedral until 1847. The district of St. Davids has been little altered during 1,000 years. There are so few inhabitants, an episcopal residence is not to be found near the cathedral. The city of Manchester of to-day is unlike the town of sixty years ago, and we need hardly add bears no resemblance to the Manchester of 1422, when a royal license was given to found a collegiate church.

It is remarkable that St. Davids, although so remote, should occupy a more important position in the Church history of England than Manchester. The Romans do not appear to have ventured as far as that part of southern Wales which became known as Menevia. Manchester, on the contrary, was a Roman station, and the early Roman missionary PAULINUS visited the district. Saxons and Danes fought and lived there. In course of time it was sufficiently recognised to be entered in Domesday Book. There it is recorded that King EDWARD held Salford and Radeclive. It is added:—"The church of Saint Mary and the church of Saint Michael held in Mamecestre I. carucate of land free from all customs but the geld." It is generally supposed that the cathedral stands on the site of the ancient church of St. Mary. But the whereabouts of the church of St. Michael cannot be ascertained. The manor was given by WILLIAM I. to ROGER DE POICTIERS. Afterwards it was granted to the GRESLIES, and subsequently the DE LA WARRES and the WESTS possessed it. In 1373 THOMAS DE LA WARRE, who was a priest, became the heir to the manor. In 1422 he was able, with the assent of the parishioners, to obtain a license from the king to found a collegiate church. The members were to consist of one warden, eight fellows, four clerks and six choristers. The subject of such institutions has not been sufficiently investigated. A collegium, apparently, was not under such strict rules as a monastery. It is possible that the members devoted themselves to theological studies and to the education of candidates for the priesthood. According to tradition St. Mary's Church was a structure of timber, and in that case the collegiate church which we now see must have appeared to the people as the beginning of a new era. More recent investigations have, however, shown that there were three stone churches on the site, one of which may have been erected in the eighth century. Manchester then formed a parish in the diocese of Coventry and Lichfield, and afterwards it became part of the diocese of Chester. If we can believe the statement of FULLER, the college and church were founded in return for a permission to marry, which THOMAS DE LA WARRE obtained from the Pope.

The founder would no doubt pay for the erection of the building. The church was, however, remarkable for the number of its chantries, and we may therefore suppose that the STANLEYS, TRAFFORDS, RADCLIFFES, and other families in the neighbouring districts also contributed towards its erection. The first warden appointed was JOHN HUNTINGDON, who held office for thirty-seven years. He was buried in a vault which he had constructed beneath the high altar. Above the vault was placed a stone slab, in which a monumental brass was inserted representing the warden in vestments. From his mouth appeared a scroll with the words "Domine dilexi decorem domus tue." It is therefore supposed that HUNTINGDON directed the erection of the church, or of the greater part of the building. The second warden was JOHN BOTH, who was deprived of his office in 1465

by EDWARD IV. as a punishment for the part he took in the Wars of the Roses. He was succeeded by RALPH LANGLEY, JAMES STANLEY I. and JAMES STANLEY II. During the tenure of the last several additions were made to the building. In the course of the sixteenth century the manor passed from the DE LA WARRES to the WESTS. GEORGE WEST, a son of Sir THOMAS WEST, was warden until 1535. That was an ominous year, for HENRY VIII. then assumed the position of Head of the Church of England. GEORGE COLLYER was the next warden. But although he would not acknowledge the royal supremacy, he was allowed to retain his office.

In the first year of the reign of EDWARD VI. an Act was passed by which the Manchester College was dissolved. The private chantries were suppressed and inventories taken of all the property belonging to such institutions. On the accession of Queen MARY the college was refounded, the number of fellows and clerks being the same as at first. After MARY came ELIZABETH, who went through the formality of again refounding the college. The standard of theology required for a warden could not have been very high, for the queen appointed JOHN DEE, the astrologer, to the office and he held it during nine years. He was succeeded by RICHARD MURRAY, who also gained notoriety and who had to run away from Manchester in 1636. Amidst such varied officials it was scarcely to be expected that the church or college would receive much care. The buildings were allowed to become dilapidated.

In the contest between the King and Parliament, Lancashire was the scene of many important events. Manchester was on the side of reform. RICHARD HEYRICK was the warden of the college, and being a man of strong will he was able to induce the inhabitants to resist all efforts to gain Manchester for the Royalists. The execution of CHARLES brought him no advantage, for the college was again dissolved. Then he endeavoured with no less enthusiasm to aid in the Restoration. In 1661 the return of CHARLES was celebrated. A body of 360 men in "great gallantie and rich scarffes" went to the collegiate church for a thanksgiving service. Forty boys preceded them "all cloathed in white stufes, plumes of feathers in their hats, blew scarffes, armed with little swords hanging in black belts and short pikes shouldered." The redoubtable Warden HEYRICK delivered a discourse, and the congregation then adjourned to the conduits, which flowed with claret instead of water for the benefit of the king's lieges. In 1688 Manchester had 500 ratepayers, and, according to MACAULAY, "that wonderful emporium, which in population and wealth far surpasses capitals so much renowned as Berlin, Madrid and Lisbon, was then a mean and ill-built market town, containing under 6,000 people." Civil war is not favourable to the preservation of buildings. The college which was attached to the church was so much neglected that HUMPHRY CHETHAM was able to obtain possession of it and to turn it into a library which still exists.

It is not necessary to enumerate the wardens who ruled over the institution during succeeding years. Like most bodies of a similar kind it was difficult to deal with the finances of the collegium. When it was proposed to make Manchester the centre of a new diocese much depended on the revenue which would be available. The Warden and Fellows refused to prepare a return, and the Ecclesiastical Commissioners had to assume that the income was 4,500*l.* The Church Commissioners recommended:—"That the new bishopric of Manchester be forthwith founded and endowed out of the revenues at the disposal of the Ecclesiastical Commissioners for England applicable to episcopal purposes; and that the diocese of Manchester consist of such parts of the deaneries of Kendal and Kirkby-Lonsdale as are in the county of Lancaster, and of the deaneries of Amounderness, Blackburn, Manchester and Leyland and the parish of Leigh, in the deanery of Warrington, all in the same county." Dr. PRINCE LEE, the headmaster of King Edward's Grammar

* See Illustration.

School, Birmingham, was selected to be the first bishop.

It was the custom of the founders of monastic institutions to seek sites near rivers. The collegiate church of Manchester is in such a position. The Irwell of to-day is not pleasant to look upon, for it seems to be nothing more than an outlet for dyeworks. But in the fifteenth century it may have resembled an ordinary stream. Whatever were the advantages of the place in those days, the site is not adapted for the display of the cathedral of such a city as Manchester. If in laying out the neighbouring streets some attention had been given to the cathedral as a central object, the defects of the site might be minimised. But the building will have to remain as we see it. The style of the time was adopted, for the old church builders wisely avoided imitation of those of preceding periods. When Gothic architecture was revived the Perpendicular style was treated as if it were an unauthorised experiment, and the cathedral of Manchester, in common with many other examples of Late Gothic, was ignored when good people were praising the spirituality of the builders of the earlier pointed styles. In our time we have grown more tolerant, and we can see in the Manchester building an interesting example both of design and planning.

As we have said, the cathedral is remarkable for the number and size of its chapels. There is a lady chapel behind the altar, besides the Derby chapel dedicated to St. JOHN THE BAPTIST, the Jesus chantry, Hulme's chantry, St. Nicholas's chantry, St. George's chantry and St. James's chantry. There is also a chapter-house. It is not impossible that other parts were also intended for private chapels. There is no plan of the building as it originally was laid out, and it is not easy to determine how many alterations were made between 1453 and 1847. Since the church became a cathedral several additions have been allowed. The west, north and south porches are all modern works. A small chapel has been erected as a memorial of Bishop FRASER, and a baptistery, besides several additions to the interior fittings, including an organ case designed by the late Sir GILBERT SCOTT, and the reredos which was designed by Mr. BASIL CHAMPNEYS. The western tower has been rebuilt under the direction of Mr. JOHN HOLDEN; and Mr. CROWTHER, who was connected for many years with the cathedral, reconstructed the greater part of the nave. The result is that the interior of the church presents a series of views to the visitor which under the dim light from the outside city differ from the cold correctness witnessed in so many English cathedrals.

AN OBJECT LESSON IN BUILDING.*

ACCORDING to a Scottish proverb, "a man who builds by the wayside has many masters." It was a fragment of ancient wisdom which much impressed THOMAS CARLYLE, who, as the son of a working mason, knew something about construction. Expressed in more modern words, it means that the firm who erects framed buildings is sure to have a large number of critics every day. In the cities of the United States many opportunities for scrutiny and judging are afforded. But it cannot be said we are familiar with the experiments in London. Hence it is that passers-by have taken so much interest in the new offices of the *Morning Post* in the Strand, which the Waring-White Building Company have in hand.

People who are not acquainted with the history of construction may declare in the dogmatic way which characterises men who judge without evidence that the framework is a mere American device, and is wanting in the qualities which from time immemorial have belonged to English building. It may be granted that frame, skeleton or cage construction has of late

years obtained extraordinary favour in America, and that American architects, engineers and contractors have welcomed the system because it enables them to erect the new variety of buildings which are adapted to the circumstances of the time, allowing a large number of people to be accommodated on a limited area of land in streets, as well as displaying expedition in construction combined with safety at a rate which is without precedent. But while granting so much it cannot be denied that framed construction had its origin in England, and the most remarkable buildings we see in New York or Chicago are only masterly developments of a system which a century ago was utilised for the erection of cotton mills in Lancashire.

BOULTON and WATT, whose names are connected with the steam-engine, produced cast-iron columns and beams which were used as early as 1801 for a mill measuring 140 feet in length, 42 feet in width and seven storeys high. Each of the floors had an area of 648 square yards. There were three iron beams used in spanning the width of 42 feet; they rested on two rows of columns, and the girders were 9 feet apart. The ends rested on the walls, and therefore the arrangement could not be considered as forming an independent skeleton or cage such as we see in the illustration. Various improvements in the character of the girders and the elements of the iron were introduced, in the hope of obtaining greater tensile strength. But it was not until wrought-iron was substituted for cast-iron—about 1844, or ten years before the first beam was rolled in the United States—that opportunities were fully afforded for the progress of which the latest exemplifications are seen in American office buildings.

FAIRBAIRN, to whom so much is owing, must have had an independent cage before his mental vision, for he says:—"In every building, whether intended for a factory which contains machinery, a magazine, a warehouse for sustaining heavy weights, or for a public edifice, one important consideration presents itself, namely, a direct combination of all the parts." As was not unusual at the time, he referred to nature for confirmation of his views about obtaining the greatest possible strength with the least expenditure of material. FAIRBAIRN was accustomed to erect mills which had to sustain not only machinery in motion, but the impact of falling weights. It was therefore allowable for him to regard the walls as an essential part of the system. In some of his later mills, however, he introduced tie-rods in the walls which were keyed to the end of each beam, in order to bind the whole in one mass. But the value of a direct combination of all the parts of a structure independently of ordinary walling was exemplified in the most emphatic manner in the Hyde Park Exhibition of 1851 and in the Crystal Palace at Sydenham. Both demonstrated the stability of skeleton construction for a variety of purposes, although cast-iron, rather than wrought-iron or steel, had to be employed in them. One of those structures was removed before the length of its endurance could be tested, but the other has survived after fifty years' wear and tear. While it stands before us it is absurd for anyone to have a prejudice against frame construction on the supposition that it is an American "notion."

It is impossible for builders in the habit of passing along the Strand not to be struck with some of the peculiarities which are to be witnessed in the framing of the offices of the *Morning Post*. There is little or none of the scaffolding and other temporary aids for building which the Americans aptly call "false-work." Under the new system the scaffolder's occupation is gone. The steel framing is erected without difficulty, and it is quickly utilised not only as a flooring for workmen, but to support the large cranes which enable materials to be hoisted and placed in or near the positions for which they are required. There is no mystery or concealment by hoardings, and the ubiquitous "man in the street" cannot fail to note every stage

* See Illustration.

of progress, as it is directed by a masterly organisation. He can infer from the varying depths of the horizontal beams where the heaviest loads will have to be borne, and by degrees realises the position of the staircases as well as of the different rooms. If he were allowed admission to the premises, he could also observe the care taken in uniting the different parts of the framework. If it were exposed to the power of some extraordinary storm or other unusual strain, he would find that the elements of the skeleton were as capable to resist the force as any railway bridge over a road or river. Our illustration is sufficient to show by the sizes of the different parts that provision has been made to withstand all contingencies likely to affect such a building. The continuity of the uprights through the principal floors is one guarantee of strength, and evidently great care has been taken to distribute the loads equably.

The exterior walls in every metropolitan building have to comply with the regulations of the official by-laws. At one time in the United States the walls were designed to carry a great part of the weight of the steelwork, just as in the old Lancashire mills. But in the latest examples the metal columns, or, as they should be called, the upright beams, really support the weight, and the exterior masonry becomes, as it were, an envelope protecting the interior, or, as RUSKIN would say, a veil. By this arrangement, not only ornamental masonry can be seen without any fear that it will suffer by fractures or settlements through loads, but brickwork and terra-cotta are used in America of a finer character than was formerly considered desirable. If, as RUSKIN says, "a wall surface is to an architect simply what a white canvas is to a painter," then it ought to be secured against alterations of the surface, and this can be done most effectually when it is relieved of duties which can be as well or better performed by materials of a different kind.

American authorities have been very exacting about the construction of floors in framed buildings. Many of the architects of the United States consider that the strength demanded and the tests which have to be applied are beyond ordinary requirements. For the offices of the *Morning Post* Messrs. MEWES & DAVIS have adopted the widely established Columbian system. Although it has been employed in large buildings in England it may not be superfluous to say that the standard Columbian floor consists of a flat slab of concrete reinforced with patent steel-ribbed bars, laid parallel in and completely embedded by the concrete, and extending from support to support. Floors can be constructed in spans up to 20 feet, the size and spacing of the bars and thickness of the concrete required being regulated by the span of the floor and the weight per foot super which has to be carried. The two methods of floor construction most commonly employed in large buildings are the "panelled construction" and "double construction." In the "panelled system" the floors are constructed between and carried by rolled steel joists or girders. The method of construction is as follows:—The necessary centring is first erected between the girders carrying the span of floor, the Columbian bars being suspended between the girders by patent steel stirrups hung over the top flanges of the girders, the length of the leg of the stirrup being regulated so as to allow at least $\frac{3}{4}$ -inch thickness of concrete under the bars. The concrete, which is composed of best Portland cement, crushed furnace clinkers or other aggregate, is then filled in to the requisite thickness and tamped in position; the surface of the floors can be prepared to take any desired finish. The girders are completely encased on sides with solid concrete, and the underside protected by patent concrete slabs secured to bottom flanges of girders with concealed anchors.

In the "double construction" which is used for the offices of the *Morning Post*, the floor is formed the same as in panelled construction, but instead of the joists projecting below the ceiling line, a separate ceiling

is constructed by laying 1-inch bars on the bottom flange of joists and embedding them in $2\frac{1}{2}$ inches thickness of concrete.

As the offices proceed many other interesting features will arise. We have only noticed those which may be considered as almost preliminary. It must, however, strike observers that to do so much within so limited an area in a short time and without any interruption of the traffic testifies to the excellence of the system under which the works are conducted. By having the parts prepared elsewhere and by delivering them neither sooner nor later than was absolutely necessary, confusion has been avoided; the operations of the men were not impeded by materials which were dumped in their way and could not easily be removed. In that manner, as in others, the offices afford a lesson to builders which in London especially was long desired.

HEXHAM ABBEY.

ON the petition of the Rector of Hexham and his church-wardens for leave to erect a nave at Hexham Abbey Church, an inquiry was held before Mr. A. B. Kempe, the Chancellor. Mr. E. W. Hanson appeared for the petitioners and Mr. L. C. Lockhart for the objectors.

The petitioners claimed that the growth of the work of the church made an addition necessary, and that the addition should take the form of a nave. They had decided, on the advice of advisory architects, that its style of architecture should be Decorated.

The following objections were lodged:—

1. Hexham Abbey Church, now the parish church of Hexham, is a great national monument, and should not be altered or added to unless the propriety of the proposed alteration or addition is beyond question.
2. A nave in the design proposed falls far short of being worthy of the present building, and instead of adding to its grandeur and dignity, will detract from them.
3. It is unnecessary to enlarge the church for the purposes of the parish church. There is in the present building space available for sittings more than double those actually used. If enlarged, the building will be too large and unsuitable for the purposes of a parish church.
4. The present scheme has not been fully published either to the parishioners or to the public at large. The report has been issued by the promoters and no adequate opportunity afforded of forming deliberate judgment upon it.
5. The plans referred to in the citation are insufficient to convey a proper idea of the intended building or its effect in conjunction with the existing building. No report on them by the architects has been published, nor have the instructions to the architects been disclosed.
6. No sufficient information as to the finances has been given to the parishioners. The terms of the gift of 15,000*l.* by the late Mr. Thomas Spencer (which it is assumed is now represented by the 17,000*l.* mentioned in the citation) have not been published or any particulars as to its investment or accumulations to the parishioners.
7. Part of the ground proposed to be built upon does not belong to the church, and it has not been shown how that ground and necessary liberties over and affecting adjacent land are proposed to be acquired.
8. Other part of the ground proposed to be built upon is part of a closed burial-ground or churchyard. As the proposed building is not only objectionable but unnecessary, the proposed removal of human remains to make way for it cannot be justified.

At the close of the first day's sitting the Chancellor intimated that he must give the addition, and said the only point for him now to decide was whether the plans submitted were worthy of the abbey.

Mr. Hanson said that Mr. Lockhart had put the promoters of the nave to all the trouble he possibly could, and at the last moment he had not dared to go into the witness-box, and did not produce a single person out of the 8,000 inhabitants of Hexham to support the captious objection, so that his (Mr. Hanson's) task became extremely simple. At the vestry meeting Mr. Lockhart sought to have the question delayed *sine die*, which meant that it would be extremely difficult for it to be taken up again. He (Mr. Hanson) had shown that need for increased accommodation was overwhelming, and that the best way to carry it out was to build a nave. Mr. Lockhart had brought no evidence to show that the nave would not be a glorious and worthy addition to the abbey, or that the promoters had not done everything

that care and forethought could suggest; or that the proposed nave was wrong in size or could be improved in detail. He simply wanted the work delayed until something more worthy could be produced; he simply said, "Because I say so, let it be adjourned *sine die*." Mr. Lockhart stood absolutely alone; he was not backed up by anybody. He had put the committee and the funds to considerable expense, and he asked that Mr. Lockhart should be condemned in such costs as his opposition had incurred.

Mr. Lockhart said that he and those associated with him thought they had taken the only course which anybody who cared in the least for the future of their grand old abbey and for its condition as the parish church could have taken. He suggested that the question of building a nave should be deferred until the funds were ample to justify them in doing it in the most worthy manner possible; they were not justified in going forward with such a scheme as that which was submitted. It was proposed to erect a nave upon lines very inferior to the scheme as it ought to be. It was said that if no nave was made and the choir was to remain as it was, increased accommodation could not be provided until the rood-screen was removed and the space for sitting extended westward. The idea of removing the rood-screen was a very simple idea. For temporary purposes—purposes which might last for a considerable time—the removal of the rood-screen would supply the need. The committee wanted the design to be Early English, and so instructed Mr. Temple Moore. The matter was referred to arbitration really—to three advisory architects, one of whom was the representative of Mr. Moore, whose preference was for Decorated. He did not insinuate that Mr. Scott, advisory architect, was an advocate for Mr. Temple Moore; Mr. Scott was a perfectly honourable gentleman. The committee, having expressed a preference for an Early English style, asked the architects to advise them as to the best style of architecture to be adopted. The architects did not like Mr. Moore's Early English design, and two of them preferred Mr. Hodges's Perpendicular; and they agreed it would be best not to lay down any style, but to choose a good architect and leave it to him. Mr. Moore himself preferred the Decorated. Mr. Moore submitted his plans, in the Decorated style, to the architects, and certain modifications were suggested. If plans had been presented showing an Early English design they would not have had this difficulty.

The Chancellor: You suggest that the nave should be Early English?

Mr. Lockhart: I do.

The Chancellor: Why?

Mr. Lockhart: Because it would harmonise with the existing building.

The Chancellor: Are you a professional architect?

Mr. Lockhart said he was not, but he had thought a good deal about these matters. Mr. Lockhart was proceeding to suggest that certain details in the design were wrong, when the Chancellor said Mr. Lockhart had not asked the architects about them. If two authorities disagreed there was a conflict in view, but Mr. Lockhart's expression was merely criticism. He would assume that Mr. Lockhart had not asked the questions because he took it that the architects would have said that the details were right.

Mr. Lockhart assented.

The Chancellor, in giving judgment, said he must take it that Mr. Lockhart was the only gentleman who objected, since he alone had filed objections, and none of the others had appeared. Dealing with the question before the Vestry, he said the Vestry had to decide the question whether or not there should be a nave, and the meeting had decided that there should be. There did not seem to be any object to be served by sending back the designs to the Vestry, or by issuing a fresh citation calling upon the parishioners to show cause why improvements should not have been made in the original plans. He had the designs finally approved by the architect and by the advisory architects, and he was in a position to deal with the matter. He had a concurrence of authority in favour of the design; the Vestry had approved of the principle of building a nave; the funds were in hand for the express purpose; and the trustees of the fund had approved of the design, and when the citation was issued only one gentleman (Mr. Lockhart) appeared in opposition. He had also evidence that the church was not sufficiently large for the requirements of the growing town of Hexham. The abbey church was a great national monument, and they must not forget that, or that the public had an interest in it. But he was at a loss to see that the

authorities had not done all they possibly could to meet the matter in that light. It was not proposed to disfigure or alter the existing building; it was only proposed to add a nave, which was needed in order that the people might gather and worship. The architects were satisfied that the design was worthy. How could he possibly, in the absence of any evidence to the contrary, do anything but accept what they said? Anything that had been said as to the unsuitability of the arrangements was only Mr. Lockhart's opinion. If he accepted Mr. Lockhart's view, he must say that the whole thing must be discussed over again, and that the question must be thoroughly threshed out as to whether the design should not be Early English. What right had he to do that? He must accept the evidence of the architects that the design was right. As to the question of funds, it was a common experience that, once a faculty was obtained and the work begun, funds were forthcoming. Before the faculty could be issued, he would have to be satisfied that the land, legally speaking, was in a proper position. That could be done in Chambers. He decreed that the faculty should be issued as modified by the plans approved by the architects, and that the actual faculty should not be issued until the point about the land was settled.

The Chancellor ordered that the costs, so far as the registrar should find them to have been increased by the opposition should be paid by Mr. Lockhart.

THE CHAPEL OF HOLYROOD.

ANY discussion of this subject must, of course, proceed upon the understanding, writes Professor Baldwin Brown in the *Glasgow Herald*, that the decision on the question at issue is by no means in the hands of the public. The decision rests with the Crown, and the most satisfactory feature of the present situation is that the Crown will be advised in this matter by gentlemen whose taste and piety and knowledge of ancient work mark them out as especially qualified for the delicate task before them. If members of the public are expressing their opinions on the subject, this is surely justifiable in view of the importance of the building under discussion, and of the fact that it offers, as it were, a test case, on which the whole question of the proper treatment of our Mediæval buildings can be argued.

The idea of "restoration" naturally appeals to the public, because the word seems to promise the recovery of a work of beauty and interest that has been lost. People will even speak of the new work of the restorer being a facsimile of the old. This is a delusion against which those in charge of old fabrics have often been warned. The new work may bear a certain specious resemblance in general lines to the old, but old work cannot be reproduced. Materials, processes, appliances, tools, the training and the habits of workmen are in modern times unlike what they were of old, and still more dissimilar is the present relation of designer to craftsman to that prevailing in Mediæval days. The result is that the whole spirit of the work of the two periods must necessarily be different. So far from being a facsimile of the old, the new work generally differs from it just in those qualities of freedom of treatment and beauty of surface which make old work most precious. Readers of Ruskin and of William Morris should be familiar with this doctrine, which has been preached with effect both at home and abroad for the last thirty years. As the writer just mentioned has said, "The life of the whole, that spirit which is given only by the hand and eye of the workman, can never be recalled. Another spirit may be given by another time, and it is then a new building; but the spirit of the dead workman cannot be summoned up and commanded to direct other hands and other thoughts." This is coming to be so well understood that not long ago Dr. Clemen, of Bonn, the official conservator-in-chief of monuments for the Rhineland, who has more fine Mediæval buildings under his care than any other man in Europe, stated that he and his colleagues were agreed that restoration work must everywhere be confined within narrower and narrower limits, and were coming to occupy the same position as the English anti-restorationists, whose prophet, as everyone knows, was the late William Morris.

New architectural work should give over masquerading as old and frankly confess itself for what it is. This is surely more honourable for the artist himself, as it allows him to express his own individuality instead of confining himself to a slavish copying of the past. Such new work

should be kept quite apart from the old; while for this last there is nothing to be done but to take the most studied care in its preservation, so as to maintain what has actually come down to us as far as may be for future generations. This aim of preservation is often alleged as a reason for setting the restorer to work, but if in the process we have destroyed more than we preserve, where is the gain? In the case of work of exceptional delicacy and beauty a covering may be needed, but it is best to make this look simply and frankly what it is and not to give it a sham artistic aspect. In this present case of Holyrood the part that shows most sign of recent decay is the west front, and this would not be protected by roofing in the nave.

There is a possibility of fanaticism in anti-restoration, and it is well to admit that no absolute hard and fast rule can be laid down. The juxtaposition of new work with old, though in principle it is to be avoided, may sometimes be rendered necessary when there is a clamant demand on the ancient structure for accommodation which in its ruined or truncated condition it cannot meet. Schemes of proposed restoration where this demand does not exist, as was the case at Iona, should be rigidly suppressed. At Holyrood suitable use would no doubt be found for a restored chapel royal. It would be a palace chapel, and a chapel for the Knights of the Thistle, but these considerations are not strong enough to overcome the objections to embarking on the necessarily perilous course of a restoration of the existing nave.

The remains of the once spacious abbey church are exiguous enough, but still present many features, like the lower part of the west front, of great interest and beauty. In the walls and buttresses different periods of work are represented, but the whole is well worthy of the care in preservation which is now bestowed upon it. How much of this walling is strong enough to support a new stone vault is a question more easily asked than answered. One of the evils of restoration, as experience has taught us, is the fact that though we are told at first that all the old work will be left intact, it is found in the end that much of it has had to be replaced by masonry of greater strength, and too often the old work has on its surface been "renewed" to make it harmonise with what is freshly built. The interior of the ruin is at present a place of no particular charm. For one thing it is a graveyard, and for another it is blocked up at the end by a comparatively ugly and modern wall and window. Such as it is, however, it is what time and its successive owners have handed down to us, and as it is it should as far as possible be preserved.

The present lines are not written from the point of view of any special knowledge of the conditions and possibilities which those responsible for advising on the ultimate decision will have before them. A conceivable solution of the problem seems, however, to offer itself in the following direction. The chapel royal had once a choir, doubtless of Norman architecture, as well as transepts. Would it not come within the technical description of a "restoration" of the edifice to build a new choir or a new chapel on the site of the choir, which would allow the modern designer to work with that artistic freedom we desire for him, while as a matter of common sense he conformed to the Mediæval character and associations of the building? Such a chapel might be entered from the present nave through a vestibule that would give the nave a more fitting termination than it has at present, and it could be suitably used for all the purposes contemplated for the restored nave, the vision of which floats so alluringly before the eyes of many who have written and spoken on this interesting theme. The position suggested for the new chapel is, of course, wholly suitable. It was once occupied by part of the original structure, and it holds all the associations and memories of the place.

In conclusion, one cannot help reflecting that to-day in Scotland there must be considerably more than 100,000*l.* in legacies and subscriptions being laid out or in readiness to be spent on schemes of restoration to which there are the serious objections indicated above. What would not this sum of money accomplish were it wisely expended on the rescue and preservation and care of ancient monuments all over the country. Now that the Office of Works is more awake than it used to be to its responsibilities in this matter, and now that it has increased legal powers under the Monuments Act of 1900, the pious donor or testator would be doing the best possible service to the monuments of his fatherland if he would entrust his money to the First Commissioner to be expended in rational and tasteful conservation.

SELBY ABBEY.

THE great fire which burst forth at Selby Abbey soon after midnight on Friday night has caused an irreparable loss. How it arose has yet to be determined. The church was for a long period neglected, but by great exertions a sum was raised which was sufficient to pay for a restoration under the late Sir Gilbert Scott. If the inhabitants of the parish approved of a rate for repairs, much injury could have been prevented. In 1889 there was another appeal by the present President of the Royal Academy for donations to uphold the building. These circumstances should be known, for they may help to explain the indifference of which the destruction of the abbey is the result. They will also suggest that the raising of 50,000*l.* will be difficult if only local aid is counted on. The *Sheffield Daily Telegraph* gives the evidence of some of the spectators of the conflagration as follows:—

Practically nothing but the walls has been left by the fire. The registers were happily thought of in time, and a few unimportant things were carried out. There was great excitement for the rescue of the font cover.

It was thought that the fire would confine itself to the east end in which it had broken out. The great square Norman tower, now all black from the fire, divides the church in two. People hoped the tower would bar the progress of the flames in the roof. But nothing could stop them. They roared and rushed everywhere like fiends which delighted in their work of destruction.

Says an eye-witness:—"How awful the interior looked in its bloody haze. Lurid lines were creeping, now running, along the roof towards us. The ceiling was falling. Down came the burning red-hot planks with a crash. Steam, smoke and fire—what a sight.

"Someone said:—'The font; let's save the font.' They could not uproot the old Saxon font, but they strained all their energies to save the cover suspended over it. A policeman mounted a ladder and tried to cut through the wire supporting it. His knife was not strong enough. Someone fetched a big pair of scissors, but they were no better, and back went the policeman to hack through the wire with his knife. Another man hurried away to a hotel and returned with some wire-cutters. With these the wire was soon cut through, and so the font cover was saved. This is characteristic of efforts that were made throughout the night; but church fittings are not so easily moved, and workers were overawed by the terrible spectacle of the burning abbey."

Said one man who was early on the scene:—"The flames roared through the building as they would through a great funnel. Everything went like tinder. Nothing could stop it. Great oak beams burnt as freely as matches. It was a magnificent as well as an awful sight. The lead roof glowed like a furnace as it melted. Everything seemed to favour the fire. It was a beautifully clear starlight night, frosty, with a fairly strong wind blowing and carrying the flames right along the roof. When the whole place was ablaze it was the sight of a lifetime."

The fire broke out about midnight in the Latham chapel, in which only a few weeks ago a new four-manual organ had been erected at a cost of 1,200*l.* The cause of the fire is a mystery, but it is assumed that the organ had something to do with it. The apparatus for blowing the organ (a Kinetic blower with gas-engine) had not been working very well, and men had been engaged upon it on Friday. They left the church, apparently perfectly secure, about ten o'clock at night. Two hours later the fire was discovered by the organist, who saw the flames through the windows from his house. The organ was burnt to a cinder.

Fire brigades were summoned from Leeds and York to help the Selby brigade. They arrived with every possible speed, so much so that one of the Leeds horses fell dead as soon as it reached the river bank, where the engines took up positions. The brigades worked their hardest throughout the night. The members were often exposed to great danger from falling beams as they tried to arrest the progress of the flames. But they were no match for the fire. Their jets of water hissed in the fire, but the flames swept on until every vestige of roof had gone.

It was the work of the brigades, however, which saved some of the beautiful stained-glass windows and the ancient oak doors. The magnificent west window has hardly been damaged at all, and even the east window does not appear to be so much injured as might have been expected. Some of the glass in this window was placed there in the early part of the fourteenth century.

But the beautiful old screen, the magnificent choir stall

and the reredos have been completely consumed. It is only about twelve years ago that the choir was restored at a cost of about 14,000*l.*, under the direction of Mr. J. Oldrid Scott. Thirty years earlier that gentleman's father, the late Sir Gilbert Scott, carried out the restoration of the nave.

There were eight bells in the tower. Some of them partially melted owing to the intense heat. Three of them fell to the floor of the church with a crash as the flames ate their way through the great oak beams on which they were hung. Others came down later in the day.

The scorched clock stopped at seven minutes past two. It worked steadily on for two hours, ringing out the quarters as they passed, until the flames climbed up to its lofty home and silenced it for ever. It was provided only a few years ago at a cost of 400*l.*

On the Sunday the usual morning service was held in Dr. Jonathan Hutchinson's Educational Museum. The vicar (Rev. Maurice Parkin) announced that he had received numerous letters and telegrams of sympathy, including messages from the Archbishop of York and the Bishop of Sheffield. In many of the messages the loss was spoken of as being irreparable, but he rejoiced to say that their loss was not irreparable. The old part of the abbey, the massive stonework, stood as firmly and securely at this moment as it ever stood. The abbey could be restored, and would be restored if God spared them to do the work. He hoped they would begin at once the restoration of at least the nave, so that within reasonable time he hoped they might find themselves back worshipping in the abbey. "The fire, I don't believe, has done any serious damage to the nave," he continued; "certainly not to the fabric. The middle roof has gone, but the side roof remains, but it is a matter for work of proceeding with the nave at once. The sacristy and the scriptorium over it are untouched by fire. The registers and all the documents belonging to the parish were perfectly safe and were not destroyed. The east window, I don't believe, has suffered beyond repair. I have been looking this morning, and in spite of the weather which has got into the building during the past night, the mullions of the east window are all secure, and it seems as if the east window might very well be spared to us, and that really is the glory of the abbey. So that which is spared to us is the very old and very ancient part of the abbey, which is so dear and sacred to us all as being the foundation of religion in this place." The abbey was insured for 10,000*l.*, and the new organ for 1,000*l.*

At nearly all the places of worship in the town sympathetic reference was made to the great catastrophe.

ELY CATHEDRAL.

IN the course of the ceremonial celebration of the octocentenary at Ely, the Dean read a commemoration of ancient and modern benefactors as follows:—Now let us thankfully commemorate before Almighty God all our pious founders and benefactors, by whose noble liberality the glory of God has been advanced and this place has become a special home of Christian faith and worship. And here, first, we must name Etheldreda, daughter of Anna, king of the East Angles, and wife of Egfrith, king of Northumbria, who founded a religious house here about A.D. 673, became its first abbess, and bestowed on it the inheritance which she received from her father and the dowry which she derived from her first husband Tondbert, the Prince of the South Gyrvi. Next we would commemorate King Edgar, who, acting under the advice and influence of St. Dunstan and of Æthelwold, Bishop of Winchester, granted afresh by his royal charter the possessions and privileges given by St. Etheldreda, which had been alienated and lost to the Church for 100 years, and conferred other marks of his favour and devotion. Let us name also the Bishop Æthelwold, by whose labours and liberality, in conjunction with the Abbot Brihtnoth, the monastery was restored and newly constituted under the Benedictine rule. During the latter years of the Saxon kingdom, we must commemorate a long series of benefactors, among whom we may especially name Wolstan of Dalham, Godwin Lord of Hoo, Earl Brihtnoth, Athelstan and Alfwyn, Bishops of Elmham, and lastly King Edward the Confessor, who, as related in the ancient chronicles (Lib. Eliens. ii. 91), having as an infant been presented by his father and mother on the altar of this church, and as a child having spent some time in the cloister school, when he came to the throne endowed the monastery with various gifts. Hence at the beginning of the twelfth century, when

the Norman church commenced by Abbot Simeon was sufficiently complete to be consecrated in 1106 under its last abbot, and when three years later the bishopric was founded, its first Bishop Herve was able to endow the see of Ely out of the revenues of the monastery and yet leave maintenance for the prior and monks in their common life of prayer and service of charity towards the poor. Our Norman and Plantagenet sovereigns sustained both the see and monastery by charters and gifts; the earlier bishops, Nigel, Longchamp and Eustace, by their liberal aid strengthened the prior and convent to fulfil the design of St. Etheldreda's foundation, and were zealously followed in their good work by many of their successors in the episcopate. In this connection," he continued, "we would especially name Dean Peacock, formerly Lowndean professor of astronomy in the University of Cambridge, through whose energy and under whose guidance the work was begun and a large part of it accomplished; Dean Goodwin, afterwards Bishop of Carlisle, under whom it was continued; and Dean Merivale, author of the 'History of the Romans,' under whom it was completed; Bishop Sparke, Bishop Turton, Canons Selwyn and Edward Sparke, and Francis Hastings, late Duke of Bedford, who made munificent gifts; Henry Styleman le Strange and Thomas Gambier Parry, who freely devoted their skill in the decoration of the roof. Of those still living who took part in the work we may not speak."

MODERN PAINTING.

A LECTURE was given by Professor von Herkomer at Eccles town hall on "The Painter; his status and relation to the public." Speaking of the effect of a sudden success in the work of the young painter, he said the chief danger was that it would mean a slavish following of fashion. Fashion was a foundling of unknown parentage and ought to have been left on the doorstep to perish. It was the cause of the artificial glamour which surrounded the successful artist. When you come near Raphael's Madonna in the Dresden Gallery you are supposed to be in the presence of something supernatural; you must worship and almost pray. To get too close to the work and see how the blessed thing is done is paramount to an act of infamy; to say to your companion "Poor painting" lifts the worshipping gazers from their chairs. Raphael supplied Madonnas just as Millais supplied pictures of little girls with mobcaps—because there was a demand for them. But Millais's ambition, shown in his earlier work, was not to supply the demand of the public, but to overthrow the conventional art then in fashion. Millais was undoubtedly one of the greatest painters of the nineteenth century, his pre-Raphaelite work having put fresh arterial blood into the art of this country. Later his ambition succumbed, perhaps, to the demands of fashion. In recent years there had been a great fashion in everything that was impressionist. Yet there were signs that the pendulum was swinging back. The recently opened exhibition of Holman Hunt's works was attracting large crowds of art lovers, and anything less modern than Holman Hunt's painting could not be imagined. It proved that, after all, there was in the public a kernel which was true, and which always came out right. As to the Royal Academy, Professor Herkomer said he had never been rejected or badly hung. But the general standard was not what it is now. One often wonders what one would have done if fate had put older artists into the present age for a start. He believed he would have done something. But what? He followed a pioneer—Fred Walker. From Fred Walker to Sargent—what a contrast. The two represent the very antithesis of art. Probably he would have been just as enthusiastic a follower of Sargent as he was of Walker. Referring finally to the value of an established name, the lecturer, after describing how pictures were selected for the Royal Academy, said many a man got his work hung because his name was known. Architects compete anonymously for public buildings. How would painters look if they had to send their pictures to the Academy in a different name every year? There would be more surprises than there are; the upshot would be nothing less than murder.

The Manchester Society of Architects have elected as Fellows James Barritt Broadbent, John Cubbon, James Henry Sellers and Alfred Ernest Woodhouse.

NOTES AND COMMENTS.

If the decision given in the New York Court of Appeals is upheld it will be useless henceforth to shirk responsibility for the insufficiency or inaccuracy of plans or specifications. The judges laid down the principle that "where the amount of work to be performed and materials to be furnished under and by a contract depend upon conditions that cannot be ascertained by inspection, and bidders are not required and given an opportunity to make such investigations as are necessary to satisfy themselves as to the amount of work to be done and materials to be furnished, and the contract, plans and specifications include representations as to existing conditions which are inserted for the purpose of enabling contractors to determine what bid to make for the proposed work and materials, a recovery may be had as for a breach of contract for the damages caused if it shall turn out that the representations were erroneous." The discreditable case in which Messrs. PEARSON were plaintiffs and the Corporation of Dublin defendants would have had a different result if the judges of the Irish Court of Appeal recognised that, although a contractor is advised to inform himself of the conditions of the work and to test the accuracy of the representations, such a course is impossible without an outlay and a loss of time which would entail expenses for which there was no valid return.

ACCORDING to the *Liverpool Courier* there is much commotion among local artists about the annual exhibition which is to be opened to the public on Monday. The committee of selection have, it appears, adopted a standard of excellence on a very high level. Instead of judging the pictures on their merits as examples of their authors' work, they condemned or praised according as they fell away from or approached to a particular style of art which has been aptly described as "forward." Among the practising members of the Academy there are only a few who have adopted the "advanced" methods of painting, the majority following art on Academic lines. The astonishing result of the application of the new standard is that the work of a great number of the members has been excluded. Among the sufferers are many painters who have been regarded locally as masters of their craft, and the committee's decision that their works are unworthy of a place in the Academy's exhibition will come as a surprise to many persons besides themselves. It has hitherto been generally understood that the Academy's exhibitions reflected contemporary Liverpool art, and in this spirit it was regarded; but if, as it is currently reported, the committee are relying for the principal exhibits on the works of Associates who have no connection with Liverpool, then the character of the display will have been entirely changed, and the Academy's exhibition will become merely a supplement to the autumn exhibition.

AN interesting pamphlet on the District Surveyors' Association has been prepared by Mr. HENRY LOVE-GROVE, the honorary secretary. The title of "district surveyor" was given by the Act of 1844. The first meeting of the surveyors was held at the London Coffee House, Ludgate Hill, and in December 1845 it was decided to hold quarterly meetings. The incidents between that time and the present year are narrated. A list of the district surveyors in 1854 is given, and it is remarked "that of all these names not one survives, and that they were architects of repute like THOMAS HENRY WYATT, EDWARD NORTON CLIFTON, with RICHARD CROMWELL CARPENTER, one of the pioneers of the Gothic revival and a church architect of large experience; also EDMUND WOODTHORPE, EDWARD L'ANSON, HENRY BAKER, GEORGE GODWIN (so long the editor of the *Builder*) and many more 'giants in the land.'" It is amusing to learn that CHARLES JAMES MATHEWS, the lightest of comedians, was through his father's influence appointed a surveyor. He relates the circum-

stance as follows:—"Bow and Bethnal Green were vacant. I offered myself, was successful, and found myself staggering under the honour of being publicly recognised as surveyor of Bow. I had cards printed, 'District Surveyor, Cutthroat Lane, Bow.'" Mr. LOVE-GROVE calls attention to the esteem in which the district surveyors have been held, and the possibility of the office falling into the hands of men with less experience. He concludes by saying:—"The withdrawal of private practice to take an appointment of varying income is not attractive, and should the surveyor be able to avoid the Bankruptcy Court through loss of income, he has nothing to look forward to in his old age but the workhouse; hence the serious falling off in the number of candidates offering themselves for the examinations held by the Royal Institute of British Architects during the last ten years."

THE President of the Board of Trade has appointed the following gentlemen as a committee to make inquiries and to report with reference to the participation of this country in great international exhibitions:—Sir A. E. BATEMAN, K.C.M.G., chairman; Mr. A. WILSON FOX, C.B.; Mr. C. A. HARRIS, C.B., C.M.G.; Mr. ALGERNON LAW; Sir JAMES KITSON, Bart., M.P.; Mr. MALCOLM RAMSAY, C.B.; Sir SWIRE SMITH; Mr. S. J. WARING. Mr. U. F. WINTOUR, of the Board of Trade, will act as secretary to the committee. The terms of reference to the committee are:—"To inquire and report as to the nature and extent of the benefit accruing to British arts, industries and trade from the participation of this country in great international exhibitions; whether the results have been such as to warrant His Majesty's Government in giving financial support to similar exhibitions in future, and, if so, what steps, if any, are desirable in order to secure the *maximum* advantage from any public money expended on this object."

ILLUSTRATIONS.

OFFICES OF THE LIVERPOOL, LONDON AND GLOBE INSURANCE COMPANY, CORNHILL, E.C.

A YEAR ago we published illustrations of the interior of the new building at the junction of Cornhill and Lombard Street. As all the parts of the exterior are now visible, we give a view of it. The building was erected by Messrs. COLLS & SONS from the designs of Mr. J. MACVICAR ANDERSON. The offices form a conspicuous object in the busiest part of London, and suggest the importance of the company for whom they were erected. The church in the background is St. Mary Woolnoth, which was designed by HAWKSMOOR, and has been more than once threatened with destruction. Beneath it now runs an electric railway.

CATHEDRAL SERIES.—MANCHESTER: FROM SOUTH-EAST.

NEW OFFICES FOR "THE MORNING POST," STRAND.

THE new building in the Strand and Aldwych which is in course of erection for the proprietors of the *Morning Post* will be of fireproof construction, similar to that of the Ritz Hotel, Piccadilly, of which a view appeared last week. White Norwegian granite is used for elevations. The roofwork and dome will be executed in copper. In planning the building the basement was assigned to the printing machines. The ground floor will be occupied by the advertisement hall and publisher's department; the first floor will be arranged to accommodate the managers and reporters; the second and third will be let as offices, while the fourth and fifth floors will remain for compositors and foundry. The architects are Messrs. MÈWES & DAVIS. The contractors are the Waring-White Building Company. The fireproof floors will be on the system of the Columbian Fireproof Company. The granite contractors are Messrs. A. & F. MANUELLE.

THE ARCHITECTURAL ASSOCIATION.

THE second meeting of the Association for the current session was held on Friday evening last at Tufton Street, Westminster, Mr. R. S. Balfour, president, in the chair.

The following gentlemen were elected members:—Messrs. L. H. Glencross, H. J. Wilson, T. E. Legg, A. R. Gunn, C. C. Durston, E. H. Hawkins, A. W. Stelfox, J. Doré, jun., T. Spencer, C. E. Skerry, T. A. Lodge, jun., W. J. Pywell, L. E. Monteuis, T. S. Linton, F. Scott, G. A. Fortescue, F. A. Silk, H. J. Benians, G. R. Hall, J. R. B. Smith, A. G. Hodgkins, E. A. R. Rahbula, D. W. Ditchburn, B. de Carle Jackson, R. G. Kirkley, T. H. McConnell, Fred Harrild, B. W. H. Scott, F. H. Swindells, H. J. L. Barefoot, F. S. Hulbert, D. C. Langford, R. A. Abbott, C. A. Farey, C. G. Clifton, R. Davies, G. W. Bacon, R. A. Cram, H. F. Saunders, S. A. Neave, A. G. Warnham Tickle, A. R. Powys, H. H. S. Willey, S. Warwick, N. W. Hick, F. R. Barry, jun., H. E. Moore, H. G. Report and Balance Sheet, Session 1905-6.

Mr. FRANCIS HOOPER, as treasurer for the year 1905-6, proposed the adoption of the accounts and balance sheet for the past session. The income and expenditure account, he said, contained few items which demanded comment. The contribution to the International Congress of Architects, he felt, would be approved as a small but fitting recognition of their gratitude to the R.I.B.A. for the valued and timely support of the evening school work and of their generous contribution to the premises fund. The smallness of the item under the head of legal expenses was testimony to the generous manner in which Mr. Jamieson had conducted his work during the session. The increased cost of the "Journal" under its new management was scarcely one to be begrudged. The five years during which he had had the honour of being treasurer was marked by an increase of membership from 1,392 to 1,665, of members' subscriptions from 1,048*l.* to 1,406*l.*, of entrance fees from new members 243*l.* to 294*l.*, whilst arrears of subscription had fallen from 158*l.* to 100*l.* As the President had reminded them in his address, the premises fund still required 767*l.* to free them from their obligations, which at the outset amounted to 8,332*l.* The speaker said he had fervently hoped that the debt would have been wiped out during his tenure of office, so that his friend and successor, Mr. Hare, could have devoted himself to the improvement of the library, reading-room and school equipment, which increasing popularity urgently demanded. He reminded them, however, that more than that sum had been spent upon the repairs and rehanging of the museum casts, together with the payment of a pension to the respected curator of the museum, those outgoings being incumbent upon them under the agreement with the Council of the Royal Architectural Museum. In conclusion, Mr. Hooper expressed his hearty appreciation of the vote of thanks passed to him at the concluding meeting of last session.

Mr. A. KEEN formally seconded the motion, which was accepted unanimously.

Mr. ALAN POTTER read the following paper, illustrated by lantern slides, on

The Architecture of the Roman Empire.

In reading this paper to-night, he said, I am very conscious of my unworthiness to speak here at all, and more especially on such a broad and uncertain subject as the Architecture of the Roman Empire, and I ask the indulgence of those many members who have a more personal acquaintance with the subject than I have. From them I hope to learn much in the after-discussion, and in the meantime I trust they will not be hopelessly bored by my restatement of old facts. I have no intention of discussing the origin of Roman architecture, or the contrivances of Roman construction; but I have collected the facts and theories of experts and, as far as possible, have marshalled them in a chronological order, as it is in the historical aspect that I intend to present them to you to-night.

The Roman Empire became, as you know, an empire in fact through the energies of Julius Cæsar and the generals

of the Republic. It was not till after Augustus had been three years the sole ruler of the Roman world that he accepted from the Senate the title of Emperor. His policy was one of peace; to confine the Empire within its natural boundaries, which were the Atlantic on the west, the Rhine and Danube on the north, the Euphrates on the east and the deserts of Africa to the south; and only in two instances was this policy set aside by his successors in the occupation of Britain and the conquest of Dacia. It is in the neighbourhood of Rome that we find the chief remains of the Augustan era.

The Forum Julium.

The Forum Julium, the first of the Imperial fora, was founded by Julius Cæsar, but not completed till after his death; situated north of the Forum Romanum it formed the close of the Temple of Venus Genetrix, an octostyle temple of Corinthian design. North-east of this, backing up against the Quirinal Hill, Augustus built the Temple of Mars Ultor, vowed to the God who avenged the murder of his uncle Julius. As it could be seen from three sides only, the fourth side or back has no colonnade, but terminates in an apse; and its wall arrangement ought to be considered in conjunction with the forum of Augustus, at one end of which it stood, the chief feature of which forum was the two hemicycles, one each side of the temple, a very favourite device of the Romans in after years. Canina restores these without the colonnade running across as a screen, giving thereby an effect of spaciousness where it is required. Three columns on the east side of the temple and remains of the hemicycle walls are all that is now left.

The Basilica Julia.

The Basilica Julia, used as a law court, in which four tribunals sat, was also founded by Julius and completed by Augustus. Its plan was that of a large oblong court, open in the centre, surrounded by a double colonnade of piers in two storeys. The most complete portion is the west corner, with brick piers and a suggestion of vaulting. One of the piers of the façade facing the forum has been built up from fragments, and gives one some idea of the design. To the east of this stands the octostyle peripteral Temple of Castor, rebuilt at this time by Tiberius on a podium of concrete and marble 22 feet high, which was decorated by pilasters, placed under the columns above. Two circular buildings, the Temple of Mater Matuta at Rome, and the Temple of Vesta at Tivoli, are interesting to compare; the former, in the low-lying ground of the Forum Boarium, has a peristyle of twenty Corinthian columns of the very light proportion of 11½ diameters; whereas in the latter, perched on the edge of a precipice, the columns are only 9½ diameters.

The Temple of Minerva at Assisi.

The Temple of Minerva at Assisi is the only instance in Italy where the steps to the entrance are carried back between the columns, which are here raised on pedestals. Continuing on the Via Flaminia there is the arch erected at Rimini by Augustus in B.C. 27 to commemorate the restoration of that road, where he also built a bridge over the river, constructed in five arches with slightly sloping approaches at each end, contrary to the usual Roman custom of carrying the road through level. The little tetra-style Corinthian temple at Pola in Istria seems also to be of this period, as well as the triumphal arch at Susa in Piedmont.

The Palaces on the Palatine.

Returning to Rome we read that Augustus, before he became emperor, lived in the house of Hortensius on the Palatine, "a simple and modest house with pavements of rubblework and simply whitewashed walls," and that it was not till after the battle of Actium that he contemplated building the palace which was dedicated in January, B.C. 26. In A.D. 2 this was burnt down, but rebuilt in a more magnificent manner, but on the same plan. Tiberius, his successor, continued these buildings, and added a new wing near the north-west corner of the hill, overlooking the Velabrum. Caligula afterwards built another palace between this wing and the Forum Romanum, the remains of which are now visible from the forum, and through the sub-structures of which one passes on the way up the Palatine. On the east side of these buildings was the semi-underground passage, the crypto-porticus, where he was murdered by the officer of the guard in January, A.D. 41, while returning from the theatre. He was succeeded by Claudius, who made no alteration or addition to these palaces, but is more famous for his huge hydraulic enterprises.

The Hydraulic Enterprises of Claudius.

The Aqua Claudia was built during his reign (38-52 A.D.) to bring water from the Alban Hills, forty miles away, and was raised high enough to supply the highest hills in Rome. The Anio Novus, a channel built on the top of this aqueduct, was fifty miles long. He also built, in opposition to the council of Government engineers, a large harbour two miles west of Ostia, enclosed by two jetties each 800 yards long, the area of which was 800,000 square yards with a varying depth of 15 to 18 feet, necessitating the removal of 112,000,000 cubic feet of sand. Nero proposed connecting this harbour to Rome by a canal, but the scheme was never carried out. His ambition was to lay out Rome on modern lines, but he found himself checked on every hand by the owners of private property and the numerous small temples and shrines absolutely inviolable in the eyes of the people.

Nero's Rebuilding of Rome.

After arranging a new plan with his architects, Severus and Celer, and having provided temporary accommodation for the people, he set fire to the city, as the easiest way of getting out of his difficulties, and succeeded so well that he reduced ten wards of the city to ruins out of fourteen, without a single life being lost. Hasty rebuilding was forbidden, as all frontage lines had to be approved, the new streets being planned at right angles to each other, as far as the lay of the land would allow. The height of the houses was restricted to double the width of the street, and each had to have a portico across the front.

Nero's Golden House.

Of this land of ruins he appropriated for his own palace an area of about a square mile, where he built the Golden House, in the grounds of which there were sulphur and sea-water baths, a huge lake with harbours and docks for the imperial galleys, besides colonnades 3,000 feet long, zoological and botanical gardens, not to mention streams, woods, vineyards and farms. Otho, on the day of his election, signed an order for 250,000*l.* to complete these buildings; but, after his murder, Vespasian, the first Flavian emperor, of low birth and more parsimonious character, at once began to give back this land to the people. He and Titus founded the Coliseum on the very spot of Nero's lake, and the latter afterwards built his baths on the foundations of the Golden House itself. I will not weary you with a description of that famous amphitheatre, and will only mention that the authorities seem now to have entirely abandoned the idea of an awning being carried by the masts which rested on the external row of corbels in the top-most storey, and believe them merely to have been used for banners.

Baths of Titus.

The Baths of Titus are of the usual plan: a main block of buildings containing the baths proper enclosed within an outer court, part of which was set aside for games and part for promenades and gardens. In the centre of this block was the tepidarium, and on the same axis were the caldarium on the one side and the swimming bath on the other, the other sides being occupied by open courtyards surrounded by colonnades. The swimming bath here was more than twice the size of others of later date and enclosed on three sides by colonnades. The Arch of Titus, erected on the Via Sacra to commemorate the final subjection of the Jews in A.D. 82, is particularly interesting on account of the representation of the ornaments of the Temple at Jerusalem as carried in the triumph of Titus. It was Titus and his brother Domitian who filled in the gorge between the palaces of Caligula and Tiberius and the House of Augustus, and built over it the Flavian Palace, which is the finest group of all the Palatine buildings, chiefly composed of banqueting-halls and reception-rooms, with the Imperial basilica at the north-east corner. Domitian also rebuilt the Augustan palace and added the stadium on the west side of it; the walls of the latter still remain, and some small fragments of the encasing marble.

The Forum of Nerva.

When Nerva was placed on the throne by the assassins of Domitian, he was already an old man, and his forum and the Temple of Minerva within it were nearly completed. It was situated between the fora of Augustus and Vespasian, a long, narrow rectangle in shape, with the Temple of Minerva at the northern extremity. The enclosing walls are decorated with detached Corinthian columns of Greek marble, the entablature and attic of the

wall being broken out over them; only two of these columns now remain, but at the beginning of the seventeenth century a great part of the portico of the temple was also standing.

The Forum of Trajan.

On the further side of the Augustan Forum was built the Forum of Trajan, from the designs of the architect Apollodorus, together with the Ulpian Basilica and Trajan's Column and Temple. The forum proper was nearly square in plan with a colonnade running round three sides, flanked by two large hemicycles of shops and offices and approached from the east by a gateway having one central archway with three Corinthian columns on each side. The basilica was a large hall enclosed on all four sides by a double aisle, beyond which at each end was an apse, used as a law court and probably screened off from the rest of the building. On the far side of the basilica stood the Column of Trajan, the sculptures of which represent his campaigns against the Dacians, enclosed by a small courtyard between the Greek and Latin libraries and facing the octostyle temple of Corinthian design dedicated to Trajan, but probably built by Hadrian at a later date.

The Harbour of Ancona.

In order to facilitate the embarkation of troops to the East, Trajan built the harbour of Ancona on the east coast of Italy, to commemorate or adorn which the Ancona Arch was built. He also continued the work of Claudius at Ostia, building inside the Claudian harbour a huge hexagonal dock 18 feet deep, some 390,000 square yards in extent, with nearly 6,500 feet of quay. It was to this harbour that the fleet of despatch boats plied and here was situated the central post office for provincial letters. The harbour of Civita Vecchia was also built at this time, and still remains among the best and safest harbours of the Mediterranean. Trajan's reign was also responsible for the bridge across the Tagus at Alcantara in Spain, erected by a few Lusitanian communities and consisting of six arches 650 feet long in all, the two central arches having a span of 110 feet and a height of 210 feet, the material being granite laid without mortar. Of the same date probably is the Segovia aqueduct with its 320 arches and the Tarragona aqueduct, 1,000 feet long with thirty-nine arches. The arch at St. Remi in France seems to be of this date and is similar to the Arch of Titus, except that it has sculptured trophies instead of niches between the columns. In Africa the triple arch at Timgad, dedicated to Trajan, the son of Nerva, is especially interesting, in that on each side of the lesser archways there are detached columns with the entablature broken out over them, surmounted by broken segmental pediments, and that over these archways are niches flanked by small columns of coloured marble with diminutive entablature complete. At Beneventum, in Italy, the Senate in 114 built an arch in expectation of the emperor's triumphal return from the East, where he was adding many new provinces to the empire; but in 116 he died there.

The Buildings of Hadrian.

The first act of Hadrian his successor was the restitution of these provinces; and his whole reign seems to have been a perpetual journey, as he visited in person every province of the empire from Scotland to Egypt. He was keenly interested in the arts, and is responsible for the design of the Temple of Venus and Rome built between the Forum and the Coliseum. It consists of two tunnel vaulted shrines each with its own portico and apse, set back to back and surrounded by a colonnade raised above the courtyard on a podium of steps; this courtyard was further enclosed by a colonnade and wall, the latter being left open opposite the porticoes. All that now remains of this temple above ground is just sufficient of the cellæ to show the type of vaulting. The great vaulted rotunda known as the Pantheon was also built by Hadrian, though previously considered to belong to Republican times. The interior is lighted by a single circular opening at the apex of the dome, which gives a window area of not quite 4 per cent. of the floor space. The portico on the south side was constructed of materials taken from the Temple of Agrippa previously standing to the north of the rotunda. At Nîmes, in the south of France, there is a perfect temple of this date, pseudoperipteral in plan and of the Corinthian order, having a deep portico at the entrance. I have not been able to discover the exact method of lighting the interior, but presume it to be top-lighted, as it could hardly be used as a museum, as it now is, if the only light came through the doorway.

The Two Antonines.

Hadrian adopted as his successor the senator Titus Antoninus, on the condition that he in his turn adopted Marcus Aurelius, then a youth of seventeen. These men, generally known as the Antonines, governed the Roman world in peace for forty-two years. Unlike his predecessor, Antoninus Pius spent all his life in Italy, his longest journeys being from his palace in Rome to his country villa. Gibbon calls the period between the death of Domitian and the accession of Commodus one of the most happy and prosperous in the history of the human race; and certainly it was so if the practice of architecture is any guide. I have mentioned some of the buildings erected by Trajan and Hadrian throughout the world, and there is no doubt that private citizens were not far behind the royal example.

Herodes Atticus.

An Athenian citizen, named Julius Atticus, on the discovery of a vast treasure under his house, spent most of it in building; his son Herodes, prefect of the Free Cities of Asia, had obtained from Trajan 100,000*l.* for the construction of an aqueduct to the town of Troas, but unfortunately, the cost exceeding the estimate by more than 100 per cent., there seems to have been a likelihood of trouble, but for the generosity of his father who asked to be permitted to make good the difference. Herodes Atticus, besides building the Odeion at Athens, also erected a theatre at Corinth, a stadium at Delphi; baths at Thermopylæ and an aqueduct at Canusium in Italy. The best-known building of the reign of Antoninus Pius is the Temple of Faustina, a hexastyle temple of white marble with a portico of cipollino columns. Canina restores it enclosed by a courtyard, though later authorities omit this, and carry the Via Sacra across at the foot of the steps. Gibbon supposes the dedication to be to the younger Faustina, the daughter of Antonine, who married Marcus, and blames that emperor for the deification of his unfaithful wife. The Syrian towns at this time were tremendously wealthy, and vied with each other in the display of architecture; at Palmyra, 140 miles north-east of Damascus, there are the most numerous remains, but all the large towns, such as Antioch, Gerasa and Damascus were laid out in a similar manner. The most remarkable features perhaps were the colonnaded streets carefully set out with architectural intent. One at Palmyra, over 3,000 feet long, consists of a central roadway 37 feet wide open to the sky and flanked by Corinthian columns 31 feet high, with side walks 16 feet wide, which were covered with terrace roofs extending over the adjoining shops and offices; at one part of this street, where a similar avenue crosses it at right angles, there are four pedestals, on each of which stood four Corinthian columns carrying a square entablature. At the eastern end of the street is a triple-arched gateway masking the junction with another street which leads away to the right in the direction of the Temple of the Sun. It is of ingenious design, being triangular in plan, so as to have one front at right angles to each street, with a coffered tunnel vault over the central opening. At least this is what Cassas shows in his perspective drawing, although he omits it in his plan. As the great pilaster of the gateway is panelled, against which the pilaster of the colonnade abuts, the arch would seem to have been in existence before the colonnade was thought of.

Temple of the Sun, Palmyra.

The Temple of the Sun, to which the second street leads, was enclosed in a huge courtyard more than 700 feet square, having the entrance on the west side and surrounded by a double Corinthian colonnade. The temple itself, octostyle peripteral, stood a little to the east of the centre of this court, and had its entrance in the flanking colonnade opposite the courtyard entrance. At Damascus the courtyard was over 1,000 feet square, and the portico of the propylæa is the only part that remains, and here the centre intercolumniation, being wider than the others, is spanned by an arch instead of by a flat architrave. At Baalbec, near Mount Libanus, the Temple of the Sun had a colonnaded forecourt about 500 feet square, entered on the east side from a smaller colonnaded hexagonal court with a propylæa consisting of a portico between two towers. This portico, Mr. Spiers suggests, was similar to the propylæa at Damascus and had a central archway, an arrangement also occurring in the temple at Atil, which was built by Antoninus Pius, and is dated 151 A.D.

The Triple Temple at Steilla.

In Africa, of this date, there is the triple temple at Steilla also standing within a colonnaded enclosure 200 feet

square, entered from the south-east by a triple-arched gateway. Each of the three temples is tetrastyle pseudo-peripteral; the centre one of the Composite order being slightly larger with half-columns on the side, whereas the two smaller have pilasters and are Corinthian in design. Belonging to the next reign is the Temple of the Capital at Dougga, in Africa, likewise tetrastyle, built of a fine limestone as hard as marble and dedicated to Marcus Aurelius and Lucius Verus. An arch at Marcouna, dedicated to the same emperor, is of the one-arched type, and has two pilasters and a detached column on each side of the opening. The arch at Orange is also attributed to Marcus Aurelius, erected to commemorate his victories in Germany and on the Danube, and it is designed to obtain effect rather by the grouping of masses than by the display of the orders.

The Reign of Commodus.

The reign of Commodus, the son of Marcus, quickly undid the results of the good government of his predecessors. After an attempted assassination he revenged himself by executing the noblest members of the senate and their friends, a pastime he varied by fighting as a gladiator in the amphitheatre. The only building I have discovered belonging to his reign is an arch at Lambessa, of very simple design. In 193 he was murdered by his domestics, who set on the throne Pertinax, one of the few remaining friends of Marcus, but after a reign of only eighty-six days he was killed by the Pretorian guards, who objected to his reforming energy after the license they had enjoyed under Commodus. They then offered the empire for sale, and accepted the offer of the highest bidder, one Didius Julianus, who gave a sum of 200*l.* to each soldier.

Septimius Severus seizes Rome.

At this the three provincial armies each declared their own general emperor, and it was the leader of the Pannonian army, Septimius Severus, who by a rapid march seized Rome, banished the Pretorians, defeated his rivals, and by a just and vigorous rule temporarily revived the era of prosperity. He restored Domitian's stadium on the Palatine, and built further west a new palace, the façade of which faced the Appian Way and consisted of seven colonnaded storeys 210 feet in height, three of which still remained in the sixteenth century. The arch erected at the west end of the forum to commemorate his Parthian victories is well known, and the Arch of Janus and that erected by the silversmiths are hardly worthy of special mention. He died at York in 211 after an unsuccessful campaign against the Scotch, and it was there that the quarrelsome brothers Geta and Caracalla assumed the purple; a quarrel which was settled within the twelve-month by the murder of Geta. The Baths of Caracalla testify to the luxury of this emperor, being the most extensive in the empire. The central block alone had an area of 270,000 square feet, and in plan was similar to the Baths of Titus except that the swimming bath here was greatly reduced, being rather smaller even than the tepidarium. The enclosure of the grounds was over 1,000 feet square, in the two hemicycles of which were lecture theatres and libraries. In Africa, at Djemila, there is an arch dedicated to Caracalla, his mother Domna, and the divine Severus, his father. In design it is a single arch between two pairs of detached Corinthian columns, over each of which the entablature is broken out. At Sebessa there is a four-sided arch with the same dedication, each side of which is similar to the arch at Djemila. It is from now onwards that we continually hear of the great Temple of the Sun at Emessa, in Syria, of which there are no particulars, and I have wondered whether it has been confused with the temple at Baalbec, which has already been mentioned, especially as they are both situated close to the foot of Mount Libanus. It was in Syria that Caracalla was murdered while on a pilgrimage to the Temple of the Moon at Carrhoe. At Zana there is an arch dedicated to Macrinus, his successor, who reigned little more than a year, till he was defeated by the Syrian army, who had set up the boy Heliogabalus, the son of Caracalla's wife. During the next fifty years there were no less than fourteen emperors, who followed each other in quick succession at the will of the all-powerful armies.

Amphitheatre at Verona.

It was during this half-century that the amphitheatre at Verona was probably built, the interior of which is so well preserved, although the exterior wall has disappeared with the exception of four bays; unlike its contemporary at Pola, where the interior is entirely gutted, leaving the exterior wall intact. Here a slight deviation is made from

the usual plan, there being four projections on the diagonal lines, which contained staircases.

The Thousandth Anniversary of the Foundation of Rome.

Mr. Alexander Graham, in his book "Roman Africa," suggests that the amphitheatre at Thrysdus was built under the third Gordian, and it is possible that the great festivities at the thousandth anniversary of the foundation of Rome, commemorated in the reign of Philip, gave the necessary stimulant for these buildings in an otherwise non-architectural age. After the reign of Valerian, who died a captive in Persia, the men of Palmyra, led by Odenathus, twice defeated Sapor, the Persian king, the former being made joint emperor by Gallienus. His wife, Zenobia, after his death, ruled over the whole of Syria and Egypt—an arrangement which satisfied Claudius II., who had his hands full fighting the Goths; but as soon as Aurelian came to the throne in 270 he laid siege to Palmyra, brought Zenobia captive to Rome, after which she retired into private life at Tivoli. No doubt, influenced by the buildings he had seen in the East, he erected on the Quirinal at Rome a large Corinthian temple dedicated to the Sun, which had a portico of twelve columns, and was enclosed in a courtyard similar to the Syrian examples. The little circular temple at Baalbec is supposed to be of this date, and possibly also the Temple of Jupiter. His successor, Probus, is credited with building temples, bridges, porticoes and palaces in Egypt, as he attempted to keep the army in order by thus occupying them in times of peace. At Tebessa there is a little tetrastyle pseudoperipteral temple built about this time, where the architrave frieze is divided into sections by small projecting panels over the columns, each panel being separately carved, as is similarly done in the attic above the small cornice.

Accession of Diocletian.

After the short reign of Carus, and Carinus and Numerian, Diocletian was proclaimed emperor on September 17, 284, who, with his associates, Maximian, Galerius and Constantius, re-established order and tranquillity throughout the empire. Of the baths he built in Rome there are considerable remains, the tepidarium or central hall being preserved as the nave of Santa Maria degli Angeli, the Christian dedication possibly resulting from the fact that Christians alone were employed in the building. The emperor himself spent only two months of his reign actually in Rome, but occupied most of his spare time building the city of Nicomedia, in Bithynia, situated on the verge of Europe and Asia, and to such an extent did he enrich it that it was only surpassed by the magnificence of Antioch, Alexandria and Rome. In 306 he abdicated and retired to the coast of Dalmatia, near the city of Salona, where he had built himself a palace. In plan it was nearly square, and covered 9½ acres. The royal apartments extended the whole width of the south side, and were entered from the north, through a circular, top-lighted vestibule, from an arcaded approach which extended as far as the intersection of the streets leading from the three gateways. To the west of these arcades stood the small tetrastyle Temple of Æsculapius, and to the east the domed Temple of Jupiter, circular in plan internally, though octagonal without, with a low peristyle and portico. The north, or Golden Gateway, has a large semicircular relieving arch, over a lintel arch enriched with carving, which is flanked by two small niches, above the whole being an ornamental wall arcade carried on brackets. The other gateways are similar in design, but not so rich. It is instructive to see what a Mediæval designer made of the same forms, a good illustration being the door to Sant Guisto at Lucca. The finest feature of the whole palace was the colonnade on the south side facing the sea, but, even as they were in Robert Adam's time, the remains are disappointing.

Emperor Constantine.

After the retirement of Diocletian the empire fell again into great disorder, at one time there being no less than six emperors; but eventually, after the defeat of Maxentius, Constantine became sole ruler. The basilica built to the west of the forum at Rome by these two emperors was practically a copy of the tepidarium of Caracalla's Baths, with an apse at the eastern end, and deep barrel-vaulted recesses between the eight main piers and their buttressing walls, these latter being pierced by arches, so as almost to form continuous aisles. At the Coliseum end, opposite the apse, there was a projecting vestibule, and it was not until a later date that the south entrance was made and another apse built opposite it. The Arch of Constantine is too well

known to need remark, except perhaps to say that most of the sculpture belongs to an earlier date, ruthlessly taken from the buildings of Hadrian and Marcus Aurelius.

Building of Constantinople.

For Constantine, born on the banks of the Danube, and raised to the throne by the army of Britain, Rome had little attraction, and it was his great ambition to perpetuate his memory by building a new capital further east. When he came to the actual building of Constantinople he soon found that the skill and number of his architects were not equal to the carrying out of his ideas; so much so that he founded schools of architecture in all the provinces of the empire, and by offering prizes and rewards encouraged capable men to make themselves known. The immediate result at Byzantium was a number of elaborate buildings, hurriedly erected on narrow streets, to adorn which he ordered that the ancient buildings of the empire should be robbed of their carvings and statues. I will merely add, in conclusion, Gibbon's list of buildings erected in Constantinople within a hundred years of its foundation; it includes a huge elliptical forum, a hippodrome over 300 yards long, a circus, 2 theatres, 8 public and 150 private baths, 52 porticoes, 5 granaries and 8 aqueducts, besides 14 churches, 14 palaces and 4,388 houses, which were, on account of their size or beauty, worthy of special mention. No remains of the buildings now exist, but we can imagine the size and magnificence of the city a little from the list of structures given by Gibbon as being executed in the first century from its foundation by Constantine.

The chief thing to be learnt from Roman work, besides the use of Classic details in many ways not dreamed of by the Greeks, is the habit of designing buildings with due consideration of their surroundings and the neighbouring structures. Thus in laying out the large area covered by the Imperial fora at Rome, where each forum is of different design and date, the existing buildings were always kept in mind and worked up to when additions were made. We are, perhaps, apt to consider a building or a monument too much as a whole in itself, whereas the Romans considered one building merely as an item in a general scheme. The Column of Trajan now stands alone, but originally it was backed up by buildings of the same scale, set out on a symmetrical plan, the very opposite to our Nelson Column or City Monument. In designing a temple the enclosure was arranged in keeping with it, with a proper approach, and was not allowed to grow up anyhow, of any shape or colour. But then, of course, architecture was popular, and added to the fame of a sovereign, whereas now such is obtained more by social reforms or the active development of fresh fields for commerce.

Mr. H. STANNUS, in proposing a vote of thanks to the author of the paper, congratulated him on the able way in which he had put together such an interesting history of Roman art. The speaker said he felt as Mr. Potter went through the paper, illustrating it with the contemporary buildings raised by the various emperors, that they were being treated to Roman history in a form in which it had not been dealt with before, and yet so succinct and complete that it would be of use to all of them as students. Mr. Potter had made the grand tour, but owing to shortness of time, and not because he despised the ability to sketch and measure, he had taken with him a camera. They saw around the walls a tithe of the views photographed. Some of them would have required two days to draw, whereas with the camera a record was obtained in 20 minutes. There was one remark, the speaker said, which closed the paper, they could not lay too much to heart, and that was the designing of buildings with due consideration of their surroundings. They might not have opportunities for building such great works as the Romans, but they could all make their work suitable to its surroundings. It was not given to many of them to build imperially, but they could think imperially, and the more imperially they thought the greater would be their delight in their work.

Mr. A. KEEN seconded the vote of thanks, and said he wished the paper had made more reference to Roman work existing in the north of Africa. He had seen in an American magazine an illustrated article which described the Roman remains in North Africa. The illustrations showed large towns with not a single modern building in them and the remains were complete in form in every way. He hoped on another occasion Mr. Potter would give them an account of that part of Roman work.

The PRESIDENT said, in hearing the history of Roman architecture, he was reminded of what a friend had said to him when he was about to visit Rome for the first time.

"Always remember," said the friend, "there is nothing in Rome except what you take there." It was the same with every place, and the paper they had heard that evening contained valuable knowledge for those who would visit Rome. Mr. POTTER briefly replied, and the meeting terminated.

EXETER CATHEDRAL.

IN a letter to the *Times* the Dean of Exeter replies to Mr. Thackeray Turner's letter respecting recent work at the cathedral. He says:—

It does not appear that Mr. Turner has taken the trouble to personally visit the work which he condemns apparently without having seen it; he relies on second-hand information, and so his statements about the great west window are inaccurate, as is known to every one on the spot.

Upon examination this magnificent window was found to be in a perilously ruinous condition, partly from the ravages of time, exposure to weather and natural decay, partly from the rude treatment which it had undergone when Peckitt's glass was put in about 1770; a broad and deep second glass line had been cut, greatly weakening the stonework. If left to itself the whole window would in a short time have fallen in; its condition was very serious. The work was undertaken after grave deliberation and under the best advice, and not one single inch of old work that was capable of preservation was not preserved, and not one inch of unnecessary new stonework was inserted—the result being that we have preserved with the most jealous care this magnificent window from becoming a complete ruin without having altered a single feature. Mr. Turner grounds his second charges on the anonymous representations of a casual tourist. Mr. Turner knows nothing of the real condition of the fabric and stonework; that is known only by those who are in daily anxiety on the spot, carefully, conscientiously, unceasingly doing their best to preserve the noble sanctuary entrusted to their charge. Here again the most careful deliberation and counsel have preceded actions. Not one inch of preservable old work has not been preserved, and no new work undertaken which has not been most carefully considered and found to be necessary for the security of the whole. If we followed the advice of Mr. Turner, advising from a distance and in personal ignorance of the real state of the fabric and stonework, we might, it is true, succeed in handing over to him or to his successors an interesting ruin; but our object is higher than this, and the anonymous comments of casual tourists will not move us. We are doing our very best so to deal with our cathedral as to leave behind us in its unaltered beauty at once a noble witness of the architecture of the past, not as an interesting ruin but as a sanctuary for the service of our successors and the glory of our God. Mr. Turner would prefer a ruin from which all traces of the past shall have crumbled away and nothing but dust and featureless disfigurement remain.

In reply Mr. Turner writes:—

I can assure the Dean that it is not an "amusement" to me to make "public accusations." My letter was clearly written on behalf of this Society, and was submitted to my committee before it was sent.

I do not wish to contradict the Dean, but, nevertheless, I hope I may be allowed to say that I know the west front of his cathedral church very well indeed, and have visited it repeatedly, and been greatly distressed to see the unnecessary modernisation which has been, and I fear is, in progress. I still venture to believe my statement that "the stonework of the large west window was rebuilt." This statement does not deny that any of the old stones were put back.

The Dean says, "Mr. Turner grounds his second charges on the anonymous representations of a casual tourist;" but the Dean commits the same fault, if fault it be, for he does not give the name or names of his advisers, simply saying that the work was done "under the best advice." I thought my letter made it clear that a gentleman was sent down on purpose to report, although some members of my committee, as well as I, had seen the work. As a matter of fact, the architect from whose report I quoted is a well-known leading authority. He says, after his careful examination, that "the great window . . . is now new;" and this is certainly the impression it gives.

No one for a moment believes that the Dean has wilfully destroyed any work which could have been saved. The earnestness of the latter part of his letter shows this. But a Dean does not rise from being a curate to his high posi-

tion through his knowledge of building; and therefore it is not unreasonable that those who have such special knowledge should receive his assurance of what stone could or could not be saved as inconclusive.

I am quite sure that if the Dean had seen the stonework in the chapter-house at Westminster Abbey, which Professor Church succeeded in preserving, and which crumbled at a touch of the hand, he would have said it could not be saved.

The Dean says, "Mr. Turner would prefer a ruin from which all traces of the past shall have crumbled away." This statement is, indeed, hard to bear when the best part of my life has been spent in trying to preserve ancient buildings. The Dean clearly cannot have read what is said on page 17 of the Society's publication, "Notes on the Repair of Ancient Buildings," and I really hope in justice he will think fit to withdraw the statement. It is impossible that the Dean can have failed to see the ancient town hall of Exeter, and to know that it was repaired by the Society. Can he say that we have left it a ruin?

THE TEMPLE AT COS.

A LECTURE on the Temple of Health recently discovered at Cos was delivered in Sheffield by Dr. Richard Caton. It was said that no student of Greek can think of Cos without thinking of Hippocrates, its great physician, and much of the lecture dealt with that distinguished man, to whose earnestness and activity Pliny and Strabo testified. He was the intimate friend, the equal, of philosophers, poets, warriors, statesmen and all the most distinguished men of his time, amongst them Euripides, Pindar, Socrates, Plato, Xenophon and Pericles. He was one of the most remarkable figures in history, and for a long time the Greeks believed that he had carried medical knowledge to the highest possible point. With the aid of many lantern illustrations from photographs, Dr. Caton gave a detailed description of the health temple of Cos as it appeared in the times of Hippocrates, showing that the institution was to some extent like a modern hydro. The temple was discovered partly through the efforts of two English archaeologists, Messrs. Paton and Hicks, who found two springs which were identified with those mentioned in the writings of the physician. Cos was a great training centre of physicians. There were dormitories (arranged to secure the free ingress of fresh air) for many people, and there was provided continual mental interest for the sick in the way of sculptures, paintings, music and books. The sick never omitted to sacrifice cocks to the god of healing and to feed the sacred serpents with sacrificial cakes. The serpents were harmless and roamed over the whole island, creating intense pleasure if they climbed on to a patient's couch and licked him. It was significant that Hippocrates rarely, if ever, mentioned the serpents, though he made pious references to the gods in his writings. He put his faith in fresh air, gymnastic exercises, massage, copious draughts of pure water and a careful diet.

TINTERN ABBEY.

THE report of the Commissioners of Woods, Forests and Land Revenues says that by the operations of this year the view of the abbey has been very materially improved by the clearing away of a large quantity of soil and rubbish from the west end of the building. The work in connection with the resetting of the centre mullion and what remained of the tracery of the great east window has been satisfactorily completed, including the protection of the gable over and walls adjoining, and the scaffolds have been removed. In the south transept a scaffold has been erected and an examination made of the upper part of the staircase at the south-west angle and of the south wall and gable adjoining, where the coping and springer to the same hung over in a dangerous manner; the wall, which had broken away, has been reset to a sufficient height to support the springer and coping and render them secure. The tops of the walls, where exposed to the weather, have been made sound and protected, and the open joints of the masonry pointed. This was an important and a very necessary work, requiring a considerable amount of material and involving much labour and time owing to the great height from the ground. Considerable repair has been carried out in connection with the passage above the arcades, the floors have been made good

to exclude water from the walls and arches beneath, and some large openings which weakened the walls have been built up. Much work yet remains to be done, especially in connection with the eastern arch of the tower, and with the north transept and stair.

RHIND LECTURES.

FOR this year's course of Rhind Lectures in connection with the Society of Antiquaries of Scotland, the Rev. A. H. Sayce, M.A., LL.D., Professor of Assyriology in the University of Oxford, was selected. In his opening lecture of the course on Monday upon "The Archaeology of the Cuneiform Inscriptions," Professor Sayce said the decipherment of the cuneiform inscriptions was the archaeological romance of the nineteenth century. It started with a guess made by a Latinist who knew no Oriental languages, but that guess was founded on scientific method and had scientific reasons behind it. The cuneiform inscriptions were first observed on the monuments of Persia. There they were always found in three parallel columns, each column representing a different form of cuneiform script. An examination of them showed that the three transcripts embodied the same text in three different languages, and it was reasonable to suppose that the first was in the language of the Persian kings themselves. This was also the simplest of the three forms of writing; the words in it were divided by an oblique wedge, and as only forty-two characters were employed it was clear that they must be alphabetic letters. In all the inscriptions there was always the same word found near the beginning; it was therefore concluded that this word signified King. Now came Grotefend's guess. The word for King was accompanied by two other words which varied according to the monuments on which they were inscribed, but the second of these words was always accompanied by the first. Grotefend conjectured that the names of Darius and Xerxes were represented by the two words in question, and that when the two occurred together they represented "Xerxes, son of Darius." With this clue in his hand, he gave conjectural values to the characters comprising the names, which were verified by his finding the same character in the two names where, if his theory were right, the same letter ought to occur. His memoir, describing his discoveries, was read before the Academy of Göttingen in 1802, but the Oriental philologists were unable to understand Grotefend's method and the memoir remained unprinted.

A generation had to pass before his discovery was again taken up by other scholars, notably Burnouf and Lassen in Europe, and Rawlinson in Persia. Rawlinson copied the great inscription of Behistun at the risk of his life, and thereby obtained fresh and important material, the result being that the Persian cuneiform texts were finally deciphered and translated in 1849. Meanwhile Nineveh had been excavated by Botta and Layard, and the inscriptions found there showed that the second transcript of the Persian inscriptions was in the Assyrian or Babylonian language. This was now attacked with the help of the proper names in the Persian transcript, and a Semitic language came to light. The decipherment of the Assyrian cuneiform, however, was a very difficult affair, since the characters were very numerous, and owing to their pictographic origin each had more than one phonetic value. Great assistance was derived from the lexical and philological tablets in the library of Nineveh discovered by Rassaus. It was found that the cuneiform script, like Babylonian culture generally, had been derived from an older people, the Sumerians, who were the earliest inhabitants of Babylonia, and spoke an agglutinative language. Another agglutinative language was that of Elam, with its capital Susa, in which the third manuscript of the Persian cuneiform texts proved to be written. Numerous inscriptions in the old language of Elam had recently been found by the French and were at present in course of being deciphered. Another previously unknown language was discovered in the cuneiform inscriptions of Armenia, which were deciphered by the lecturer in 1882. These inscriptions had revealed the existence of a powerful kingdom on the shores of Lake Van before the present Armenians entered the country. Other languages written in cuneiform characters had also come to light, the latest found being that of the Hittites in Cappadocia. Grotefend's guess had thus been like a grain of mustard seed which had grown into an overspreading tree.

LIGHT IN DARK ROOMS.*

IT has long been recognised that light is one of the essentials of health, and as we are not yet able to obtain a perfect substitute for daylight at a sufficiently cheap rate, properly lighted rooms must be taken to mean those that are sufficiently lit with daylight.

Light is necessary to health, because it directly promotes the vital processes which are necessary to life; because dark rooms mean dirty rooms; because light, especially sunlight, is antiseptic to the germs of disease, and notably to tubercle bacilli; rooms artificially lit with gas, the usual alternative to daylight, are still unhealthy, though modern improvements have diminished the unhealthiness.

And yet there is no definite provision in the Public Health Acts for insuring that dwelling and work-rooms are properly lighted. The provisions for underground rooms separately occupied require a window of a certain size, and doubtless the Acts had in view daylight as well as ventilation, but light is not mentioned in the Public Health Act, 1875, or in the Public Health (London) Act, 1891. The only way in which dark rooms can be dealt with is by declaring them to be a nuisance or injurious to health. The Borough Council of Woolwich has obtained a conviction in a case where a front basement room was proved to be dark, this being the only nuisance complained of. The room was not separately occupied or used for sleeping; it was lighted by a window looking into a small area, having over it a grating through which alone light could be obtained, and it was proved that large print could not be read in the middle of the room on a clear day an hour before sunset. The medical officers of health of Greenwich and of Woolwich gave evidence both of the room being dark, and their opinion that light was essential to health. For the defence it was shown that the tenants had occupied the room for over twenty years and were still alive. An order was made to abate the nuisance with 23s. costs. Additional light was provided by increasing the width and height of the window and the width of the area, and replacing the grating with one in which the bars were at right angles instead of parallel to the front of the house.

The principal causes of darkness are:—Insufficient size of windows; windows wrongly placed, e.g. in a corner; room underground with area of insufficient width, or covered over; street too narrow to give a sufficient angle of light; back additions; trees obstructing the light.

It is not proposed to discuss all these heads fully, but simply to mention a few instances of how light has been supplied in my own borough. During the past five years windows have been provided or enlarged, or additional light provided, at several hundred houses.

One very simple mode of obtaining light is the use of whitewash for the surface of areas, adjoining and opposite walls and interior surfaces. The whitewash needs renewing once a year. For areas whitewashing is a temporary expedient; coating with glazed bricks is preferable and often of great utility if the area is sloped at the right angle.

One of the simplest and cheapest means of improving light is the use of highly refractive glass, such as Muranese and, better still, prismatic glass. Muranese glass has a raised pattern, and prismatic glass is fluted in straight lines; both have one plain surface, which should be outside, and the ribs of fluted glass horizontal. This kind of glass has the advantages of refracting the light so that it does not all fall on the floor near the window, and of making curtains and blinds unnecessary for purposes of privacy. The use of such glass for increasing the light of offices and work-shops is well known, but it is not likely to be used for dark living-rooms unless at the instance of the sanitary authority.

When a forecourt exists it is possible in some cases to increase the light of basements by sloping off the area at a larger angle and tiling its surface. When there is no forecourt and the area is necessarily covered with a grating the nature of the grating is of importance. The bars should be narrow but deep, and they should be set at right angles to the house wall, and not parallel as usually found.

But in many dark basements very little light can be obtained unless the window can be raised in height. In most windows the larger part of the light enters near the

* A paper by Sidney Davies, M.A., M.D. Oxon, medical officer of health, Woolwich, published in the Journal of the Sanitary Institute.

top, and this is especially the case in underground rooms. Often the height of the window cannot be raised without encroaching on the floor of the room above. In three cases in Woolwich this difficulty has been overcome by cutting away the rafters, fixing a trimmer and constructing a bulk-head in the room above. The result was very satisfactory in each case. In other houses when the height of the basement room was under 7 feet the floor has been lowered 12 inches or 18 inches, and this has increased the lighting of the floor and furniture.

In cases where a basement has consisted of an underground room in front and a room above ground-level behind, the party-wall between the rooms has been removed for the greater part, the two rooms thrown into one, and a large, well-lit room obtained.

In cases, however, where it was attempted to gain additional light for a dark room by constructing a glazed window in the upper part of the party-wall, the result has been unsatisfactory, as might have been foreseen.

To lighten the room to the greatest advantage, the window needs to reach to the top, and to be nearly in the middle of the wall. In one case a room with a good-sized window was badly lighted owing to a high wall a few feet off, which almost wholly prevented direct rays of light entering the room. But the window did not reach to within 18 inches of the ceiling, and by raising it 12 inches light was enabled to enter direct from the sky, and the light was doubled. In other cases rooms have been dark owing to the window being in a corner, or at one side of the wall; in such cases a small additional window has been constructed.

When trees appertaining to the house obstruct the light the remedy is obvious; if, however, the trees are on the property of another owner, the matter is more difficult, but a representation to the owner has frequently had the desired effect. In one case the front rooms of half a street were dark, owing to high ground opposite on which were a number of overhanging trees, the ground appertaining to army barracks. A representation was made to the commandant, and after a little delay all the obnoxious trees were cut down, with very marked improvement to the houses.

The use of outside reflectors, as in city offices, has not so far been found practical for living-rooms.

Second in importance to the lighting of living-rooms is that of staircases and passages, though here the primary object of a window is usually ventilation. A passage and staircase without a window has been held in London police courts to be a nuisance, where the house was occupied by more than one family, but a prosecution would probably fail in any other case. Little difficulty has been found for the most part in Woolwich in making a moderate sized window on a dark staircase.

The cost of putting a small window in an external wall to light a staircase is not much, the district surveyor's fees being frequently the most serious part. When there is no exterior wall a skylight can sometimes be made, but this is less satisfactory, as it is difficult to clean and to keep out rain, and the cost is greater. Failing a window, glass panels in bedroom doors are useful to a small extent, but the chief substitute for a window as regards light is a light-coloured paper or other wall surface frequently renewed.

The above refers only to old houses. It might be thought that at this hour of the hygienic day it would be unheard of for a house to be built in which there was a living-room not well lighted. But even the stringent provisions of the London Building Act do not prevent such cases.

One of the commonest means of defeating the Act is the erection of back additions of such extent as to shut off most of the light from the back rooms of the main part of the house; in addition to shutting off light they necessitate the windows being squeezed to one side of the room, so that a large part of it is always in shade. When the yard between two adjoining back additions is covered with a glass roof (allowed in the London Building Act under the title of a conservatory), not only is most of the light, but also the air, excluded from the rooms. New houses on old sites may still be built without sufficient provision of light, and new houses may be built so as to shut out light from existing ones.

The London County Council has proposed amendments to the Building Act which will remove some of the difficulties pointed out above; but it appears that the only satisfactory way of insuring that the dwelling-rooms of new houses are sufficiently provided with daylight is to enact that no new house shall be occupied unless each

habitable room is certified to be properly lighted by daylight.

With old houses what is wanted is a further definition of nuisance as "any dwelling-room not provided with proper means of lighting by daylight."

But let not any sanitary reformer wait for legislation. The prospect of obtaining any useful sanitary measures or amendments seems remote indeed, and meanwhile I can only express the hope that all sanitary authorities may make as good use of the existing Public Health Acts as the Woolwich Borough Council has done.

TESSERAÆ

Harp Alley and Its Wares.

THE state of the arts in the days of Thornhill and Hogarth's time would, in our days of exhibitions, be considered at a very low ebb; when the only encouragement, or rather the only means of employment to be procured was in sign-painting, the place of show and sale was found in Harp Alley, Shoe Lane, near Fleet Street, where from end to end of that place, the works of the candidates for public favour and employ were to be found—a sort of Noah's Ark, in which animals of every hue, kind and colour might be seen, from the pencil of Catton, varied by the still-life of Keyse, whose legs of mutton, with every kind of butcher's meat, would be no less admired for their excellence as works of art in the present than in their former day. Here, too, might be seen the compositions of Hayman as a ticket porter and gentleman—"The Salutation," "A Grave Digger," &c. It must be remembered, however, that sign-painting, though it may appear contemptible in the eye of modern practice, was the staple traffic for the sale of art, and what the tradesmen of our time expend in their ample glass windows and shop fronts was in those days expended on the painted sign, which, with its massive carved frame and ornamented ironwork, cost in many instances from 100*l.* to 150*l.* It may also be observed that the style of painting required for this sort of art a firm pencil and a decided touch, together with an effect which might tell at a distance—no bad foundation for skilful execution in art. As these signs for the most part were swung by their projecting support from the houses to the middle of the streets, and the lives of His Majesty's liege subjects were often perilled by these suspended pictures, a Bill was brought into Parliament by Lord Bute to prevent the danger which hung like the sword of Damocles over the heads of the unwary passengers. This was in some sort at that time considered the death-blow to art, and parents no longer thought of placing their sons in a profession that was fast falling into decay.

Rembrandt's Axioms.

Men of great and original genius who, like Rembrandt, have little of what is ordinarily called education, and who seem wayward in their tastes and habits, are sometimes looked upon as inspired idiots. But in the mind of such a man the immense amount of knowledge accumulated by close and silent observation, knowledge of a kind not to be communicated by words, is something wholly inconceivable to the learned merely in books; and if their reading has opened to them a world from which he is shut out, he also lives in a world of his own, equally interesting, the wisdom and enjoyment of which his pencil is constantly employed in communicating to all who have eyes for the sublime aspects of nature, and hearts fitted to receive such impressions through their eyes. The very few sayings recorded of Rembrandt are remarkable for their mother-wit and sound sense. "On one occasion," says his pupil Hoogstraten, "when I was very troublesome to my master Rembrandt by asking him too many questions respecting the causes of things, he replied very judiciously:—'Try to put well in practice what you already know; in so doing you will in good time discover the hidden things which you now inquire about.'" "A picture," he said, "is finished when the painter has done with it." And when the works of his latest and best practice in execution were examined too closely, and probably criticised as unfinished, he said his pictures "were not intended to be smelt, but looked at." He felt the restraint of what is considered superior society, and either avoided or stole from it on the first occasion, and when asked his reason, replied, "If I wish to relax from study, it is not honour, but liberty and ease that I seek."

The Destruction of Selby Abbey.

SIR,—Every Yorkshire historian and antiquary—as, indeed, almost thousands upon thousands of the laity—has read with the deepest distress of the lamentable catastrophe at Selby. That this historic pile has been reduced to ruins is the bitter regret of the whole community. Will you, therefore, give me the courtesy of your columns to say that the proprietors of *Yorkshire Notes and Queries* have decided to open a fund towards the cost of rebuilding this ancient fabric, and that any sum remitted for this almost national purpose will be thankfully and promptly acknowledged?

CHAS. F. FORSHAW, LL.D., F.R.Hist.S.,
Editor *Yorkshire Notes and Queries*.

Bradford: October 21.

"The Lady of Shalott."

SIR,—A wish has been expressed in many quarters that the nation should become possessed of an example of the work of Mr. Holman Hunt. It has been ascertained that the last great work of the painter, "The Lady of Shalott," can be obtained for 7,000 guineas. The picture is now on view at the Leicester Galleries, Leicester Square.

"The last, and in some respects the most triumphant, of Holman Hunt's works," it has been the artist's main labour at intervals for the past fifteen years.

It is the completed realisation of an early conception and the culmination of an ideal of faithful art service; and though, owing to failing eyesight, in the last year of work upon the canvas Mr. Holman Hunt was assisted by a friend, no line, tone, tint or portion of the design, to the least detail, was determined by any but himself. It is a picture that the artist is content to be judged and remembered by.

A committee has been formed for the carrying out of this object, including the names of the Rev. H. M. Butler, Master of Trinity, Cambridge; the Earl of Carlisle, S. P. Cockerell, I. Gollancz, Anthony Hope, Walter Crane, T. G. Jackson, R.A., the Bishop of Ripon, Sir William B. Richmond, R.A., Canon Rawnsley, Archdeacon Sinclair, T. H. Warren, Vice-Chancellor of Oxford; the Rev. H. G. Woods, Master of the Temple, and they will be glad to add to their number the names of those who are interested in this proposal.

Among the sums already promised is one of 250*l.* given conditionally that nine others will promise a like amount. The Master of the Temple is hon. treasurer of the fund, and subscriptions will be gratefully received by him.

A subscription list, through the kindness of Messrs. Ernest Brown & Phillips, is also open at the Leicester Galleries, Leicester Square.—Yours, &c.,

H. G. WOODS,

Hon. Treasurer, Temple, E.C.

H. D. RAWNSLEY,

Hon. Secretary, Crosthwaite Vicarage,

Keswick.

October 20, 1906.

GENERAL.

A Memorial to the late Marquis of Salisbury, subscribed by the county of Herts, was unveiled on Saturday at Hatfield. The bronze statue is placed immediately outside the entrance gates of Hatfield House. The Marquis is represented seated in an Elizabethan chair holding a scroll and wearing the robes of the Chancellor of the University of Oxford and the collar of the Order of the Garter. The carved pedestal is of Portland stone and shows the Cecil family arms on the front. Mr. G. Frampton, R.A., is the sculptor.

M. Ferdinand Chaigneau, known as the last painter of the Barbizon school, has died at the age of seventy-six in the village of Barbizon.

Mr. Robert Surtees, formerly city engineer of Ottawa, died in Toronto on September 29. He was born in England seventy-one years ago. He was appointed city engineer of Ottawa in 1875 and held the place for a quarter of a century, becoming one of the best known city officials in the Dominion. On leaving the city service he became the engineer of the Ottawa Improvement Commission.

A Deputation from the Royal Irish Academy waited upon the Chief Secretary last week to lay before him a statement as to the urgent need of a complete printed catalogue of the Irish manuscripts in the library of the Academy.

The Coventry City Council on Tuesday agreed "That, subject to the sanction of the Local Government Board being obtained to the provision of shops in connection with the buildings and to a loan of the necessary amount, the erection of municipal offices and shops in Earl Street and St. Mary's Street be proceeded with at an estimated cost, exclusive of site and furniture, not exceeding 30,000*l.*, and that the matter be remitted to the committee, with authority to take all necessary steps for carrying the recommendation into effect."

At the Annual Meeting of the British School at Athens, at Burlington House, on October 30, Professor R. C. Bosanquet will read a paper on "Recent Excavations at Ancient Sparta."

Mr. Mervyn Macartney has been appointed by the Dean and Chapter of St. Paul's as their consulting architect, in the place of Mr. Somers Clarke, who has resigned.

The Winchester Cathedral Restoration Fund had last week reached the total of 23,000*l.* out of a minimum of 30,000*l.* It is hoped to inaugurate a permanent fund for future repairs.

Messrs. Bennett & Bennett, engineers, Southampton, have been awarded the prize of 100*l.* for the best drainage scheme for Emsworth offered by the local authority. Messrs. Stringfellow, of Emsworth, and A. S. Stallard, of Havant, jointly won the second prize. Mr. Strachans, of London, acted as assessor.

The Second Autumn Exhibition of "The Society of Twenty-five English Painters" will open to the public at Messrs. Dowdeswell's galleries, 160 New Bond Street, on Friday, November 2.

The Foundation-stone was laid on Saturday of the mission hall, St. Mark's Church, Portobello. The building is to be erected from the designs of Mr. C. H. Maidman, architect, Edinburgh.

The King's Memorial Baths erected at Newcastle-under-Lyme as a memorial of the coronation of King Edward VII., who is the lord of the manor of the borough, were opened on Monday. The baths have cost nearly 14,000*l.* They contain a plunge bath 100 feet by 35 feet, a smaller plunge bath mainly for children, Turkish baths, Russian vapour baths, &c. The building has been erected by Mr. S. Walton, jun., Newcastle-under-Lyme, to the design of Mr. J. B. Langley, architect, Manchester.

Mr. E. E. Ford, of the Borough Surveyor's Office, Swindon, has been appointed assistant borough surveyor of Doncaster. There were 228 applications for the post, for which the salary is 80*l.*, rising to 100*l.*

The Magistrates of Birmingham at a meeting passed a resolution calling "the attention of the watch committee to the inadequate ventilation of the great hall of these courts, and to their ventilation generally, and requests that means should be at once taken to bring about some improvement."

A Memorial consisting of a bronze medallion on grey marble is to be placed in Madeley Church, Shropshire, in memory of Sir Wyke Bayliss, who was born at Madeley. Captain Adrian Jones, the sculptor, will design the tablet.

The Executive Committee of the Association of Municipal Corporations, at a meeting held at the Westminster Palace Hotel on Friday last, decided to interview Mr. H. Gladstone, the Home Secretary, in reference to the High Court's decision in the Hythe Burial Board case, in which an adjoining landowner was held to have the right to prohibit the interment of the dead in a public cemetery within 100 yards of his land. Mr. Gladstone is to be asked to secure an amendment of the law, which as it stands would prevent many of the cemeteries in this country being used if the adjacent landowners raised an objection.

Childwickbury, St. Albans, the seat of the late Sir Blundell Maple, is to be offered for sale. The estate includes the manor of Childwick, which dates back to the Saxon kings, when it was part of the domains of the monks of St. Albans. The manor remained in the hands of the Church until the Dissolution, when it was granted by the Crown to Sir William Cavendish, who surrendered it subsequently to Edward VI. in return for lands in Derbyshire. Shortly afterwards it passed into the hands of John Rowse, who, with his descendants, retained it for over a hundred years. The mansion-house was built during the reign of James II.

The Architect.

THE WEEK.

THE death of Mr. JOHN THOMAS MICKLETHWAITE on Sunday last, in his sixty-third year, deprives English Gothic of one of its most ardent students. While so many have to follow other styles, he contrived to be faithful to it alone. As a pupil of Sir GILBERT SCOTT he upheld the traditions of the Spring Gardens office. Eight years ago he was appointed to the charge of Westminster Abbey, and there was no architect better qualified for that important office. The descriptions he wrote are evidence of the careful study he had made of all parts of the Abbey. He had also studied Mediæval life, especially as it was followed in monasteries. He recognised the change which had taken place from the earlier rule. And without a knowledge of such change, he said, it was impossible to understand the development of monastic buildings; but having that knowledge, "we may see the meaning of much which the mere moulding-monger despises, and, when he can, destroys, to 'restore' the earlier design, but which tells us of the life of those who inhabited the building, and how it was slowly altered as time went on, and refinement or laxity—which you will—increased." It will be evident from these words that Mr. MICKLETHWAITE perceived a connection between architecture and Mediæval life. He was recognised as an authority in the Society of Antiquaries on much else besides building. He read several papers before it and other societies. As an architect his practice was not extensive. He contributed only two designs to Academy exhibitions, viz. Hospital at Wakefield and the Church of St. Hilda, Leeds, with a design for a Church-house at Westminster in connection with Mr. SOMERS CLARKE.

THE late Mr. FRANK McCLEAN, on his death, bequeathed a large sum of money to the University of Cambridge for scientific purposes. He was a son of Mr. McCLEAN, who was well known as a railway engineer and was at one time president of the Institution. Although recognised as a student of science, Mr. FRANK McCLEAN had also other tastes, and in addition he was a collector of Greek coins, which is one of the most fascinating of pursuits for a man with money to spare. His brother, Mr. JOHN R. McCLEAN, M.A., of Trinity College, Cambridge, having resolved to increase the collection, has been fortunate in realising his desire, which was that it should become complementary to the LEAKE collection in the Fitzwilliam Museum. He has now presented the collection of Greek coins, exceeding 5,000 in number, to the museum, which will henceforth, in consequence, occupy a place in the front rank among English numismatic repositories. Many of them are unpublished coins, and a large number are not represented in the collection at the British Museum. The thanks of the University will be given to Mr. McCLEAN for his munificence at the next congregation.

IN the *Durham Advertiser* Mr. J. W. FAWCETT has done much to rescue the names of some of the worthies of the county from oblivion. In the last number his subject is WILLIAM ROBINSON, who was closely connected with English architecture in the eighteenth century. He was the oldest of the three sons of WILLIAM ROBINSON, of Kepyver and Gilesgate, Durham, and was born at Kepyver about 1720. He received his education at the parish school of St. Giles, studied for an architect in the city and went to London while a young man. On January 30, 1746, he was appointed clerk of the works to Greenwich Hospital, when he

superintended in 1763 the building of the infirmary designed by JAMES STUART. Between the years 1750 and 1775 he assisted WALPOLE in executing the latter's plan for Strawberry Hill. Simultaneously he was clerk of the works at St. James, Whitehall, and Westminster, and surveyor to the London Board of Customs, for whom he designed, between 1770 and 1775, the Excise Office in Old Broad Street. In 1771 he became Secretary to the Board of Works, an office which he held until his death. He made a design for rebuilding the Savoy, but this was superseded on his death by Sir WILLIAM CHAMBERS's plan for Somerset House. He died of gout at his residence in Scotland Yard, London, on October 10, 1775, and was buried in the chapel at Greenwich Hospital.

THE uncertainty of the law has been exemplified in a remarkable way in the case of *KINE v. JOLLY*, which was decided in the House of Lords on Thursday of last week. The earlier stages of the action are recorded in *The Architect*. Mrs. KINE applied for an injunction against a builder in December 1903 to prevent him from obstructing the light and air to her house at Acton. The injunction was granted. But the order for demolition was withheld until the appeal was heard. Prior to the rehearing judgment was given in the case of *COLLS v. Home and Colonial Stores*. With this decision before them the Court of Appeal remitted the case to Mr. Justice KEKEWICH, in order to decide whether the loss of light was of an extent to entitle the plaintiff to damages. His Lordship decided in the affirmative, and an order was accordingly made that such part of the house should be taken down as affected the light of the morning-room and hall. The defendant again appealed, and a majority of the Court came to the conclusion that the order to take down ought not to have been made. But an inquiry was ordered as to the extent of the damage which plaintiff had suffered. The builder brought the case to the House of Lords. The appeal was heard by the Lord Chancellor, Lord JAMES OF HEREFORD, Lord ROBERTSON and Lord ATKINSON. In the end their Lordships were equally divided. The Lord Chancellor and Lord JAMES OF HEREFORD were in favour of the plaintiff in upholding the judgment of Mr. Justice KEKEWICH, while the other Lords were in favour of the builder. The Lord Chancellor expressed his profound regret that in a matter which was comparatively small such enormous costs were incurred, and which it will be difficult to divide between the two parties.

THE venerable FRÉDÉRIC MISTRAL is one of the most glorified of Frenchmen, for he represents Provençal poetry. His "Mirèio" has been made the subject of an opera by GOUNOD, and others of his poems are esteemed as epics. MISTRAL is expected to differ in his ways from ordinary men, and there is no surprise expressed at the announcement that he is making arrangements for the erection of his tomb. The place selected for the resting-place of the poet is in the cemetery of Maillane. He has a theory that French poets at least are related to the Greeks. But a great many of the inhabitants in the South of France believe they are the descendants of Greek wanderers. As a Western Greek, MISTRAL is resolved that his mausoleum shall have some of the characteristics of a Greek temple on a small scale. In Baux there is a ruined structure which is supposed to have been a Roman, if not a Greek, pavillon. It was visited in the twelfth century by troubadours, knights and ladies, who used to compete in love songs and other literary exercises. An adaptation of this will be erected by MISTRAL. It will have a dome surmounted by a cross, and will be constructed of costly marbles. MISTRAL has reached his seventy-sixth year, but his admirers must hope it will be long before the temple is applied to its contemplated use.

GOVERNMENT TRAINING.

THE letter from the Secretary of State for India in Council to the President of the Royal Indian Engineering College at Cooper's Hill gives the *coup de grâce* to an institution which should be considered as evidence of what panic can do when it seizes the mind of a Minister of State. The earlier Indian railways were designed and carried out by civil engineers who were not ordinary Government officials. There were numerous men in England who were only too glad to accept appointments in a country where so many Englishmen and Scotsmen had acquired wealth. Then came the Mutiny and, as was to be expected, railway extensions were suspended. Lord STANLEY became Secretary of State, and he grew alarmed about the possibility of not having a sufficient supply of skilled assistants for public works. He therefore resolved on the establishment of Cooper's Hill College in order to be a nursery for them. The authorities in India, on whom the responsibility for the conduct of public works really rested, did not approve of the project. They declared that they considered the success of such a college to be very uncertain, and that they had grave doubts about any necessity for such an establishment. Lord STANLEY was morbidly self-opinionated, and was quite positive about understanding the circumstances of India better than any of the officials in Calcutta, Bombay, or Madras. Accordingly the Cooper's Hill estate was purchased from Baron GRANT for 55,000*l*.

The number of professors and other officers was out of all proportion to an institution which could only accommodate at the most 125 students. During the thirty-five years in which the college has been opened the total number of students admitted was 1,623, or about forty-six a year. According to the president, Sir JOHN OTTLEY, the number was put down at forty-two a year. He calculated the fate of the students as follows:—"An average of fifteen drop out of the batch during the course, and ten more complete the course without obtaining an Indian Government appointment, whilst only seventeen get such appointments. In other words, of every forty-two who have entered the college more than 35 per cent. have dropped out; about 24 per cent. have completed the course but failed to get an Indian Government appointment, and 40 per cent. have obtained appointments." Sir W. H. PREECE, who as a Government official himself was not likely to be too hard in judging, put the averages in another way:—"Cooper's Hill," he said, "is very extravagant. You must remember that at Cooper's Hill you are now merely getting boys from the public schools, and those boys are not selected in any shape or form. It is a mere matter of luck whether, out of the twenty-five who go in, five are good for railway engineering, one good for telegraphs, and so on." It would not be according to precedent for a Government department to declare that at any period of its existence it committed a mistake, and therefore Mr. JOHN MORLEY says that the college has successfully fulfilled the purpose with which it was founded, besides serving the interests of the Empire at large.

If success attended Cooper's Hill during thirty-five years, why is the building to be closed? The report of the committee appointed in 1903 declared that in other ways well-qualified engineers could be obtained without maintaining a special college, which did not, moreover, provide any particular advantages to the student. Even for the latest addition, that of forestry, it was found to be without any advantages. The explanation of the closing given by the Secretary of State for India is as follows:—"It is sufficient to refer briefly to the great change which has taken place since 1871 in the facilities for obtaining a scientific education in engineering in the United Kingdom, and to the fact that there are to-day a large and increasing number of universities and other institutions, equipped with costly appliances and having highly specialised talent at their command, where the subjects hitherto taught in the college at Cooper's Hill can be studied. In these circumstances it was felt that

it was no longer justifiable to cast upon the revenue of India the charge of maintaining a special college for the training of the engineers required for its service, and that the time had arrived when the Secretary of State in Council should look to these institutions for the supply of men for India."

Cooper's Hill may therefore be said to have vanished; not, of course, without leaving a deficit which India or Great Britain will have to meet. After the inquiry had been made by some half-dozen practical men the college could not be upheld. The most that can be said for it is that in 1871, when it was founded, there was no established engineering college in England, and that Lord STANLEY and his advisers were unable to understand how engineers could be trained except in classrooms. A little consideration should have convinced them that the system by which the greatest modern engineers were produced, men whose counsel was sought by foreign Governments and who had created engineering as a whole, was good enough to enable young men to take levels in India and to help in laying out works. But we cannot expect such knowledge in a Government office as would be possessed by an ordinary business establishment. A private individual or a public company in 1871 who required structural works on an extensive scale to be carried out in India would have been satisfied with the assistant engineers who are to be found in Westminster. It would be recognised that the principles adopted in one country for construction were applicable in others, and there would be no difficulty in bringing experience to bear in India. But the method of business in the India Office was unlike that followed in the City.

The failure of one Government experiment in respect of training naturally gives rise to the question whether others would not be discovered if the same kind of tests were applied to them. The official system of teaching science and art corresponds in some measure with that followed in Cooper's Hill. Undoubtedly there was far more reason for making the experiment of setting up schools of design in Somerset House than for founding a costly engineering college. Design was not systematised in 1837, and although there were some artists who could produce patterns in England, yet for most of the work except of the humblest kind, in which art was in demand, it was necessary to have recourse to foreigners. At first the aim of the schools was narrow, if not inadequate. Developments followed from time to time, until at length the original purpose of the schools was ignored, for scant attention was given to the designing of patterns or models. Let us grant that the experiment was called for by the necessities of the time, although when schools of design were first opened it seemed as strange for the Government to undertake art teaching as it would appear if proposals were now made to open schools of medicine and surgery, law and divinity. If after thirty-five years the Cooper's Hill experiment could be abandoned without any loss to Great Britain or to India, it may well be asked why an experiment which has been conducted for double that time continues to be necessary? Comparatively few people were concerned in Indian engineering, yet a supply of capable men was forthcoming. But industrial art has a relation to the majority of people, and, like all prosperous industries, should after a time have been left to grow without official fostering. In the course of seventy years a great many designers must have come into existence, and, just as in other professions, businesses or trades, they are the rightful instructors to those who are to succeed them; but so long as it is supposed that Government is making provision for all the requirements of manufacturers, what may be considered as the natural source of design is neglected. Young people take up the study, but they rarely become the pupils of men who live by the practice of design. Indeed, regular pupilage seems to be going out of favour in all branches of art, although it is the surest way to attain skill.

It is not only the neglect of pupilage which is to be dreaded; another evil also arises. At the present time it would be folly for an individual to set up an art school in London or in one of the provincial towns, resembling those of JULIEN, of TRÉLAT, of GUICHARD, and others in Paris. If he proposed to obtain the co-operation of able men it would be of little avail. The Government or colleges or societies seem to be combined for the purpose of preventing all private enterprise. But it is not difficult to imagine the advantages which such a school would possess. Yet under modern conditions it is an impossibility.

When science followed art as an allied subject for instruction, the aim of the Government was as limited as in art. The mining school connected with the Geological Survey formed the nucleus, and for a time the school was known as the Government School of Mines and at a later time as the Royal School of Mines. Afterwards the field was enlarged and it became the Normal School of Science, the connection with the School of Mines being still respected. Six years ago the title was changed to the Royal College of Science. The importance now attached to science in the official mind is evident from the last edition of the regulations for the Royal College of Science and Royal College of Art. There are 213 pages devoted to science, while art, including museums, can only have eighty pages. Science as taught in South Kensington is now of almost universal extent. It comprises mechanics, physics, chemistry, biology, geology, metallurgy and mining. Each of the groups has subdivisions, and mathematics is not neglected. The syllabus of the school is therefore very extensive, and at the present time an effort is being made to enable the college to obtain a monopoly of science teaching in the Metropolis.

In this case, also, it is possible that officialdom has gone beyond the necessities of the case. If it had been foreseen that the schools of design and the science school were to attain their present magnitude it is possible no Government would have made the experiment of founding them. Any success which Great Britain has attained was through individual efforts. It was always insisted on that the province of Government should be limited. The most which an economist like STUART MILL would allow in respect of education was that Government should insist on the elements being taught, and if required should establish schools for that purpose. It is doubtful whether anyone who has entered into the spirit of the constitution would care to go further than MILL. It is true that Government can employ unlimited resources. But will any unofficial individual have the courage to say that the results of the enormous expenditure on science and art during the last fifty or sixty years have been commensurate with the price which the country has had to pay for them?

There is no doubt the Royal College of Science possesses a numerous staff of professors, assistant professors and instructors. But we must remember that at Cooper's Hill the teachers were proportionately more numerous than at South Kensington, and yet the engineering college was a disappointment if not a failure. Possibly in both cases the students have felt from belonging to Government institutions that they possess privileges, and as there are no opportunities for pitting them against students who were taught elsewhere, there is only inadequate emulation and too little of a stimulus to exertion.

A Discovery has been made at Winchester Cathedral during the progress of the excavations for the underpinning of the structure. Near one of the buttresses at a depth of 12 feet the workmen came upon some paving composed of red and black tiles, each 1 foot long, 11½ inches wide and 1½-inch thick. The paving, which extends some distance, is embedded in the peat, and there are remains of a rubble wall on each side of it. Experts express the opinion that the tiles are the remains of an ancient Roman watercourse or conduit.

ELECTRICITY SUPPLY OF THE METROPOLIS.

IN one of the recent reports of the finance committee of the London County Council it is pointed out "that, having regard to the heavy capital commitments of the Council, both as regards tramways and other services, and to the present condition of the money market, which is most unfavourable to large issues of stock, capital expenditure by the Council should for the present be strictly limited to purposes which are absolutely necessary and urgent." We can easily imagine the surprise of that committee when they saw the report which recommended that the supply of electrical energy in the Metropolis should be secured as part of the work of the Council. Already some of the local authorities have powers to supply electricity in bulk, and their expenditure on account of electric lighting and other uses of the power amounted up to March 31 of the present year to 5,450,000/. Is it wise to interfere with local authorities and with companies, and to undertake still larger expenditure in order that the supply of electrical energy may become more generally available?

To some extent the answer has been already given, i.e. if we can accept a Select Committee of the House of Commons as qualified to give a decision. After investigating various schemes during more than twenty days the Select Committee recommended the adoption of one large and inclusive scheme, which should comprise not only the whole area of the Metropolis, but adjoining boroughs and districts. It was also considered that a central authority was required, and that the London County Council should be that authority. Finally, the committee suggested that as the provision of cheap electric-power for London was important and pressing, the necessary action should be taken without delay to obtain an Act for the purpose. It was therefore incumbent on the Council, notwithstanding the condition of the money market, to investigate the subject, in order that a proper Bill should be drafted.

It must be admitted that the London County Council has acquired an unfortunate reputation for grasping or centralising. It may therefore be supposed that the Select Committee of the House of Commons was merely playing up to one of the characteristics of the Council. So much has been accomplished by the co-operative efforts of individuals, it will at first sight appear as if private companies could as well deal with electricity as with steam-power or water-power. It is satisfactory to know that specialists have come to the conclusion that both economy and efficiency are secured when electricity is produced on a great scale. The machinery that is necessary for generating the power is costly, and on that account electricity cannot rival gas as regards price in certain places. It is possible to utilise electric-power in a detached mansion, but the expenditure which is required at first and the annual expenses are enough to demonstrate the peculiar conditions which attend the production of so invaluable an agent. The owner of such a mansion would probably fail to understand why illumination with him must be so expensive, while in some of the model dwellings of the Metropolis a tenement of three or four rooms can be lighted for less than a shilling a week. In no class of manufacture is the difference in scales of production more marked than in obtaining electric-power.

There must, however, be some limit to all varieties of manufacture. That is found to be the result of experience with private firms or companies. Some people may therefore think that the County Council have interpreted the recommendation of the Select Committee, about supplying adjoining boroughs and districts in addition to the entire county of London, in a too liberal manner. The outside area of supply which is contemplated by the Council includes parts of Essex, Kent, Surrey and Middlesex. The total area involved is 451 square miles, comprising 117 square miles in London and 334 square miles in the surrounding districts. We doubt whether the United States have

attempted to bring electricity to bear on an area equally extensive.

The most important consideration is the manner of treating existing undertakings. It is concluded that if a large generating station is created, independent generating systems, however costly in character, should not be allowed to have co-existence. Economy would not be promoted, and the aim of the Council is to secure a cheap supply of electricity. It is therefore proposed that the Council should be empowered to acquire compulsorily the electric undertakings of the borough councils of Battersea, Bermondsey, Bethnal Green, Fulham, Hackney, Hammersmith, Hampstead, Islington, Poplar, St. Pancras, Shoreditch, Southwark, Stepney and Stoke Newington. The Bill is also to provide that no further capital expenditure shall without the consent of the Council be incurred by the local authorities on the works in question. With authorities outside the county of London the Council do not propose to exercise compulsory powers; the whole or part of any undertaking is to be purchased by agreement. There are also companies having powers to supply electrical energy in the county of London. Their property can be acquired compulsorily by local authorities in 1931 and subsequent years. What is now recommended is "that the Council should be empowered to purchase compulsorily the undertakings of companies within the proposed area of supply at the time when, and on the terms on which, such undertakings would have become purchasable by local authorities, or at any time to purchase by agreement the whole or any part of such an undertaking." The value of the companies' property will be much greater than that of the local authorities', for the expenditure up to December 31, 1905, by companies supplying London amounted to 12,718,534*l.* It has yet to be ascertained how far the existing machinery and other plant can be utilised by the Council. But in any case a large loss will have to be sustained.

The great generating station is to be either at Barking or at Erith, and it can be erected in sections. It is suggested that in addition to giving a supply untransformed at high pressure, the Council should also give the supply at the pressure and of the kind which may reasonably be required by the various classes of consumers, and provide the necessary transforming apparatus. It is estimated that the cost of the generating station, including land, would be 1,400,000*l.*, while the cost of the transmission and distribution system, &c., would be 2,650,000*l.* It is anticipated that the demand for electricity would be so great that the revenue from the undertaking would be more than sufficient to cover the expenditure. It is declared to be of the utmost importance that a cheap supply of electricity should be available for manufacturing purposes, for within the proposed area the volume of manufactures is greater than in any other manufacturing district in the United Kingdom.

The finance committee have not had time to consider the proposals fully. But they point out that the extent of the undertaking and the amount of capital expenditure involved would be to a great extent beyond the Council's control. Within seven years the expenditure of four and a quarter millions would be required for a first instalment of the work. That sum would be in addition to the money needed for new tramways and other services. In taking over the undertakings of the boroughs the Council would also have to accept the outstanding debts.

The proposals are almost enough to appal the ordinary ratepayer of the Metropolis. No doubt the purchase of the existing undertakings need not take place immediately. Many of the shareholders in companies object to compulsory sale at any time. But as soon as the new generating station is erected at Barking or Erith there will be a desire to utilise its possibilities, and efforts will be made to obtain early possession of the existing undertakings. It should also be borne in mind that electricity is not expected to

be the only motive-power in a future time which is approximately near to us. As SHAKESPEARE says, the appetite grows by what it feeds on, and the victory over steam, which seemed to result from the experimental work of a very few years, has made men of science anxious to obtain a power which will supersede electricity. From the results already obtained several experimenters both in England and abroad are sanguine of success. After all, it may be only a dream of science. But those dreams, although often derided, very often become realities. It would not necessarily follow that the plant which was prepared for the distribution of electric-power would serve for the new force. In the vast metropolitan area there might be room for steam, electricity and hydraulic-power. But at a time when nothing that is scientific appears to be permanent it would perhaps be prudent to hesitate about involving the people of London in an increase of expenditure when the actual saving by the new proposals would not be of great account to the average ratepayer, and it is well to remember that the advantage offered by the new project consists mainly in saving.

SELBY ABBEY.

THE following report by Mr. G. J. Oldrid Scott has been presented to the committee:—

The deplorable fire which has done such great injury to the abbey broke out on the night of Friday, October 19, in the Latham chapel, in which the new organ had lately been erected. This chapel stands east of the north transept and opens also into the north aisle of the choir. The fire spread thence into the transept and choir, and later into the tower and nave. The injury done in every part of the building is immense, though the actual amount of destruction varies very considerably. The effects are worse in the immediate neighbourhood of the organ, the inflammable nature of which caused such intense heat that the face of the stonework exposed to it has been almost entirely destroyed.

The arches leading from the Latham chapel into the transept and the choir aisle have lost every trace of their mouldings, while the pier from which they spring is so much injured that it, as well as the arches, must be reconstructed. The two windows in the chapel are much injured, one of them having lost its tracery entirely. The chapel roof has disappeared, while not one atom of the organ remains. So furious was the fire at this point that the adjoining bay of the choir aisle has suffered almost as much as the chapel itself—the stone ribs of its groined ceiling are destroyed, while all the stonework in the immediate neighbourhood will need extensive renewal.

The choir, one of the noblest examples of Decorated architecture in the kingdom, has suffered grievously. Here the roof with the beautiful oak groining has entirely perished, and also the whole of the internal fittings, consisting of the long range of stalls, all the screens filling the side arches, as well as the reredos, which was erected at great cost fifteen years ago. This was given by the late Mr. Houldsworth, and it is only quite recently that it was completed by the addition of much rich gilding at the expense of his family. The marble paving of the sanctuary is destroyed, and the fine stone sedilia has received considerable injury.

Perhaps the most serious matter in the choir is the destruction which has taken place in the lower part of all the columns carrying the side arches. Here the flames from the burning stalls and screens, as well as from the timbers falling from the roof, have calcined the stone to a great depth, large parts of it having fallen away or become shattered. This injury is happily almost wholly limited to the inner faces of the columns which were most exposed to the heat and it does not extend to the finely-carved capitals and canopies. Nor are the arches, with their splendid mouldings, injured to any serious extent. This is a most happy circumstance, as it is the finest work of its kind in England, and its loss would have been indeed lamentable.

Higher up it is satisfactory to note that the clerestory windows, with their beautiful parapets, have escaped with very little injury, as well as the clustered shafts from which the groining springs. This groining, though generally of oak, has the lower part of its ribs worked in stone to a height of about 4 feet, and here again no great harm has been done.

Another subject for congratulation is the comparative safety of the grand east window. Its flowing tracery is unequalled, and the stained glass, which dates from the fourteenth century and which was restored some years since at the cost of Mr. William Liversedge, is of the utmost value. The firemen were told to concentrate their efforts on this splendid feature, and though the floor immediately below it was for a long time a veritable furnace, the mullions and tracery remain practically perfect, while the noble stained glass has only suffered such injuries as can readily, and at no very great expense, be made good. The glass in this window is amply insured, so that the cost of its restoration is provided for.

The aisles of the choir are groined with stone, and this fact prevented their receiving serious injury. Their roofs are intact and most of their windows are uninjured. One or two had to be broken by the firemen, and one, on the north side, was destroyed by the flames from the organ. This window was given by Mr. Liversedge some years back, and he intends to replace it.

The floors have suffered a good deal, especially such parts of them as are of wood, but on the whole the injuries are not very serious.

The north transept has lost its roof and seats, while such parts of it as are connected with the Latham chapel have suffered very severely. The large window has been partly burnt out.

The tower arches have happily suffered no irreparable injury, but all the floors and the roof have disappeared. Looking up the tower the sky can be seen crossed by a few iron beams, on which are insecurely perched three of the eight bells, the others having fallen to the floor and become broken. Over and above the injury the tower has suffered from the fire, there is in it a source of danger which should certainly be dealt with in connection with the other repairs, as the opportunity, if missed now, could never recur. The tower was originally built on a most insecure foundation. Instead of the piers having been carried down to the solid clay which underlies the site, they only penetrated the upper soil to a small depth, and as this soil consists of a kind of quicksand full of water, the great weight of the tower caused it to sink very seriously. This action began soon after it was built in the twelfth century, the arches abutting on it being much distorted. In the seventeenth century the mischief had gone so far that the south-east pier of the tower gave way, and the greater part of the superstructure fell, destroying the south transept and the adjoining parts of the choir and its south aisle. This pier was rebuilt a few years later, together with the south and east sides of the tower, while the injuries to the choir and its aisle were finally made good fifteen years ago. The weakness, however, still remains on the north side of the tower and only a few years since gave those concerned much alarm. The result was that it was thought necessary to remove the upper stage of the tower, which dated from the eighteenth century, in order to reduce the weight on the foundations. The tower can never be looked on as permanently secure till this weakness has been removed by underbuilding the foundations and carrying them down to the solid clay below. This happily is found at no great depth, and it is of the utmost importance that this essential work should be undertaken.

The abortive south transept has only suffered slightly.

The nave was the last part of the abbey attacked by the fire. This fact explains the comparatively small injury it has sustained. The fire brigades from Leeds and York were on the spot, and their efforts saved the stonework from any serious damage. The roof has gone, though a few beams still remain in a charred condition, showing the design of the panelled ceiling. The oak benches were practically destroyed by the falling timbers, but the noble ranges of arches and windows remain in a perfect state and hardly show a trace of the fire to which they were exposed. The nave aisles are also nearly intact, the glass alone having suffered to any extent. The western towers have their roofs partly burnt, and the glass in the west window is a good deal cracked. As the nave is by far the least injured part of the building, it is the intention of the vicar and churchwardens to press forward its re-roofing with all possible despatch. Drawings are being made, and tenders will be obtained for this work as soon as possible. The repairs required in other parts of the nave and its aisles will be done at the same time, and temporary screens will be placed in the eastern arches, so that the nave will be enclosed and rendered fit for use at as early a date as can

be arranged. It is hoped that it may be possible in this way to resume the abbey services in about twelve months. In the meantime, it is hoped that all the other parts of the abbey may be re-roofed and the ravages of the fire made good.

The restoration of the choir will of necessity take a considerable time, as all the missing fittings will have to be supplied, while the repairs to the stonework are very serious, and of a nature which forbids any undue haste. Nor can the new oak fittings be hurried, while to replace the large organ which has been destroyed must take many months. However, if only the necessary funds are forthcoming, no time will be lost in carrying out all these essential works, and it is confidently hoped that in three or four years the whole abbey may be brought back to the beauty and magnificence which it had but a short time since.

I proceed to give the approximate cost of the different divisions of the works I have described.

Nave and its Aisles and West Towers.—New roof of the same design as the old, with the colouring of the panelled ceiling, the general repairs to the nave, its aisles and western towers, new floors so far as necessary, the temporary enclosure at the east end, 5,000*l.*

Choir and its Aisles.—The general restoration of the choir with the new roof and oak groining, following in all respects the old design, the restoration of the injured stonework and floors, the general repairs to the choir and its aisles, 8,250*l.* (The repair to the painted glass in the great east window is not included, being provided for by separate insurance.)

The Fittings.—The reredos, altar, altar rails, repairs of sedilia, aumbries, side screens, stalls, repairs of stone screens, pulpit, organ case and other fittings, 8,000*l.*

The Tower.—Reinstatement of the roof, floors, bell beams and ceiling, general repairs and paving and underpinning, 3,500*l.*; recasting and hanging the bells, say, 500*l.*

North Transept and Latham Chapel.—New roofs and floors, rebuilding the stone piers and the three arches, general repairs, new tracery, &c., where necessary, 6,000*l.* (the organ is not included, as it is separately insured); architect, clerk of works and incidental expenses, 2,500*l.*; contingencies and unforeseen expenses, say, 2,000*l.*; total 35,750*l.*

Two points remain to be considered, which, though outside the repairs necessitated by the fire, are of very great importance, and of much interest to all who knew the abbey.

The first relates to the completion of the tower by the addition, in a suitable style, of the missing belfry stage. An old drawing is in existence showing the tower as it appeared before it fell in the seventeenth century, and a design was made some years since founded on this. The cost of this work is estimated at 6,000*l.*

The other is the addition of the south transept, which was destroyed by the fall of the tower. No one can doubt that the south side of the abbey loses very much in beauty by the absence of the transept, and it is possible that it may be thought well to include the new transept in the works to be undertaken. The design for this was made in connection with that for the completion of the tower. The estimated cost of this addition is 8,000*l.*

J. OLDRID SCOTT & SON.

2 Dean's Yard, Westminster :
October 1906.

BRITISH SCHOOL AT ATHENS.

ON Tuesday the annual meeting of the subscribers to the British School at Athens was held, with Lord Halsbury as chairman.

The report stated that excavations were begun this spring on the site of Sparta, and the work, mainly experimental, had given extremely important results. The most important archaeological find of the year had been the discovery, near the bank of the river Eurotas, of the shrine of Artemis Orthia, the savage goddess at whose altar the Spartan youths underwent the ordeal of scourging. In the trial trenches which had been sunk a greater mass of the remains of the archaic period of Greek art had been found than had ever been found at any site, and that included thousands of votive offerings of various materials, and a series of painted terra-cotta masks. The masks might have been used in some ritual mystery play, and thus had important bearings on the earliest history of the drama in Greece. In the coming session it is hoped completely to

excavate the site of the Temple of Artemis, which has now been expropriated, and to do this as quickly as possible, as delay is dangerous because the Eurotas is subject to violent floods, when the erosion of the bank is very rapid. It is estimated that for the satisfactory excavation of this site, and for carrying on the work in Laconia in other directions, not less than 1,500*l.* will be needed, and the committee hope that this amount will be subscribed.

Professor R. C. Bosanquet said the work of the school during the past year was somewhat eventful. Mr. Dawkins had undertaken journeys with special objects to Mount Athos, where he had collated MSS., to a remote part of Thrace, where he had witnessed a mystery-play embodying Dionysiac traditions, and through the Turkish islands, where, in conjunction with Mr. Wace, he had studied the fast-vanishing costumes and dialects. Mr. Hasluck had made two journeys in Asia Minor and obtained fresh material for his book on Cyzicus. Mr. Dickins had continued his work on the sculptures of Damophon, and had been invited by the Greek Government to help in the re-erection of the colossal group at Lycosura. Mr. Wace and Mr. Tillyard had studied during the winter at Rome, and had worked at the Sparta excavations from March to June. Among the six new students there were two expert draughtsmen, Mr. Orr, whose work had lain in the Candia Museum, and Mr. Traquair, who had made plans and drawings of Mediæval castles in the Morea, and Byzantine churches in Constantinople. Miss Hamilton, a Carnegie student, had completed her book, since published, on miraculous cures in heathen temples and Christian churches. Of the other new students, Mr. Droop had devoted himself to a study of some problems of the early Iron Age. Mr. Brown had investigated the topography of the battle of Delion, and Miss Abrahams the arrangement of drapery in early Attic sculpture. By the successful inception of the campaign at Sparta a long-cherished scheme had been realised which would add new chapters to the history of Greek art and of Greek institutions.

Mr. G. A. Macmillan said they had lost Sir Richard Jebb, to whom primarily the school owed its foundation. Professor Bosanquet, who with such marked success had held the post of director for six years, had retired. The committee was fortunate to obtain in the new director, Mr. R. M. Dawkins, one who had a high reputation as archaeologist, philologist and explorer. Dr. Walter Leaf had been nominated a trustee in the place of Sir Richard Jebb, and was thereby relieved of the office of honorary treasurer, which he had held since the foundation of the school, in which he was succeeded by Mr. V. W. Yorke.

RHIND LECTURES.

THE second of the course of lectures by Dr. Sayce, professor of Assyriology in the University of Oxford, had for subject "The Archæological Materials: the Excavations at Susa and the Origin of Bronze." Professor Sayce said the science of archæology might be said to be founded on the study of pottery. Pottery was practically indestructible, and owing to the combination of conservatism and love of variety common to mankind, it was found that different ages and districts were marked by differences in pottery, which was, nevertheless, uniform over a definite period of time. Hence archæological chronology was in great measure based on a succession of ceramic forms. In Egypt, more especially, this chronology had now been thoroughly worked out, thanks largely to the impulse given in 1862 by Mr. Rhind, who was the pioneer of scientific excavation in that country. In Assyria and Babylonia, unfortunately, there had hitherto been but little scientific excavation, "museum objects" being alone sought for and little attention given to the conditions under which they were found. Thus far the chief scientific work in Babylonia had been performed by the French at Tello, but here all the remains belonged to practically the same age (B.C. 4000-2700), and so threw but little light on those of a later epoch. In Susa, or Shusan, however, the ancient capital of Elam, M. de Morgan had since 1897 been carrying on elaborate excavations in accordance with the most modern archæological methods, and since one of the results of his work was to show that Elam was once a province of Babylonia, light had indirectly been cast by them upon Babylonian archæology. At Susa the remains of two neolithic settlements had been discovered beneath those of the historical city which was founded before 4000 B.C. The earlier neolithic settlement was characterised by a fine thin pottery

which had affinities with that of Asia Minor and prehistoric Egypt; then came other settlers with inferior pottery. These last were succeeded by a population among whom the civilisation of Babylonia was introduced, including the use of copper, seal-cylinders, alabaster vases and the like. They also employed a black ware with incised lines filled with white. Similar pottery had been found in Palestine, Egypt—where it was now regarded as having been brought by the Hyksos—and even Spain. With the introduction of copper the historical age of Elam began. The earliest worked copper of which we knew was met with in Babylonia, which continued to be characterised by the use of copper instead of bronze down to the Persian period. In Assyria, however, bronze was known from about B.C. 2000 onwards, and apparently was introduced from Asia Minor, where the earliest bronze implements yet discovered were found by Dr. Schliemann in the second prehistoric city at Troy. In Egypt bronze first appeared in the time of the twelfth dynasty, but an analysis of the gold ornaments of the sixth dynasty shows that there must already have been intercourse between Egypt and Asia Minor. And as far back as B.C. 3000 the Assyrians had established colonies in Eastern Cappadocia, where there were mines of copper and other metals. Tin, however, was not among them, and one of the chief puzzles of archæology therefore was at present, Whence came the tin of which the early bronze of Asia Minor was composed? So far as the archæological facts went they indicated Asia Minor as the country in which bronze was invented, although according to the mineralogists, not only was no tin found there, but no early tin workings are met with nearer than Spain and the British Isles.

In his third lecture Dr. Sayce said that one of the earliest discoveries of Assyriology was that the pictographs out of which the cuneiform characters were developed were invented by a people who spoke an agglutinative language. This people was called by the Babylonian scribes Sumerians, and to them were due the primitive culture and civilisation of the country. The discovery, however, was opposed to the prejudices of scholars, and was accordingly received with incredulity, though it is now one of the established facts of science. Sumerian culture was adopted and improved upon by Semitic settlers, the result being the Babylonians of history, who were a mixed race, and from certain points of view might be described as speaking a mixed language. In physical type the Sumerians appear to have resembled the Elamites, who also spoke an agglutinative language, which, however, was not related to Sumerian. An analysis of the original Sumerian pictographs gave an idea of the culture of their inventors, and indicated that they must have been invented on the shores of the Persian Gulf, their inventors not being yet acquainted with the use of metals, and, owing to the scarcity of stone, employing hard wood for their tools and weapons. On the shores of the gulf Eridu, "the Good City," the early seaport of Babylonia, was built between six and eight thousand years ago, though the silting up of the coast has now made it an inland city more than 100 miles from the sea. From Eridu Sumerian culture spread into the Edin or "Plain" of Babylonia, the Eden of the Old Testament, where great engineering works were carried out, the floods of the Tigris and Euphrates being stored and canalised and the land drained. Up to the last Sumer or Southern Babylonia remained predominantly non-Semitic; the Semitic element being most powerful in Akkad or Northern Babylonia, where the first Semitic empire (of Sargon of Akkad) arose in B.C. 3800. Historical Babylonia, in which the Sumerian and Semitic elements were combined, was characterised by agriculture, which belonged more to the Sumerian element, and trade, which was more especially Semitic in origin. It became a great commercial community, even the crown prince taking part in trade. To the Semitic element also was due the anthropomorphism of Babylonian religion, the gods being conceived as men, while conversely the human king was deified. The Sumerians had no gods properly speaking; they were still in the animistic stage of religion, and the sorcerer among them took the place of a priest. With Semitic anthropomorphism the priest entered upon the scene, and the triumph of the priesthood, who eventually succeeded in absorbing the State, marked the final triumph of the Semitic element in the population.

Mr. Thomas H. Longfield, F.S.A., architect, died in Dublin on Sunday. During several years he was keeper of the Museum of Science and Art in that city.

TURTON TOWER.

MANY of us remember the late Mr. James C. Scholes, says Colonel Lees Knowles in the *Bolton Chronicle*, and we have read with pleasure his interesting and valuable works, such as "Documentary Notes relating to the District of Turton" and "Notes on Turton Tower and its Successive Owners." I am not, however, proposing to tread in the steps of our local antiquary, but merely to put together a few observations upon the architecture and condition of Turton Tower, which may perchance be of interest at the present time. "Turton" is a contraction of "Tower-town," and Turton Tower, whence the name is derived, is an interesting and valuable memorial of the past. No doubt originally there was merely a single tower, of the kind known as peel towers, so common in ancient times on the borders. These towers appear to have been constructed of earth and timber, strengthened by palisades; but latterly a "peel" was a small square tower with turrets at the angles, and with a door considerably raised above the ground. The lower part, where the cattle were kept, was generally vaulted. The word "peel" appears to be derived from the Latin word *pila*, meaning a pillar or a pier, and also a mole or mass of stone, from which, no doubt, we have the English word "pile," meaning a tower or castle, and the expression, "a pile of buildings."

The tower, a single rectangle of stone, probably about three storeys in height, with walls about 4 feet in thickness, was placed close to the banks of a stream. There are no architectural features remaining to determine the precise date of the original walls, which are of a somewhat rough order, with large quoin or corner-stones. The ash-laring or facing used to cover walls of rubble is very irregular, large stones being packed with small ones. The masonry, however, is in a singularly perfect state of preservation. At the north-west corner of this rectangle are the remains, perfect still at the top, of a "vice." A "vice," or a "vise," as it is sometimes spelt, is the newel or central shaft of a winding staircase. The word is derived from the Latin *vitis*, "a vine," and allied to the French *vis*, "a screw." It is not quite apparent whether this is a part of the original structure or whether it was added when, towards the close of the feudal period, the tower may have been converted into a more comfortable residence by the introduction of mullioned windows, which probably were substituted for the previous loops and arrow-slits. At the north-east corner of the battlements, in the earliest part of the building, may still be seen the shaft of the garderobe for the soldiers. This is perfect, but its outlet at the base is now concealed. The garderobes in the walls were cut probably at a later date.

In the opinion of my college friend, Mr. W. D. Caröe, a Lancashire man and a distinguished architect, the first change, if the walling is of earlier date, took place in the fifteenth century, when windows, apparently of two lights on the two lower storeys and one light above, iron-barred and shuttered, but without glass, were introduced, and when, according to clear evidence, there were three low storeys in the building. At this time the extent of the tower was still only a rectangle. This is clearly shown by the remains near the pantry-door of a window almost entirely destroyed, and by the further remains of a window—now internal—above it. Both these were on the original north face of the tower. Two of the windows of this date on the ground-floor, one on the upper floor and five on the original top floor still remain blocked up, but all of these last are not easily visible. At the same time, the lower portion of the present kitchen wing was added, and most probably the garderobes cut in the thickness of the original walls. This kitchen wing consisted of a two-storeyed building, with a heavily-timbered, pitched roof. It had three detached and large chimneys in the centre and two corbelled from the west wall. The grotesque label terminations or projecting mouldings now existing on most of the windows of this wing are modern, and probably belong to the restoration of 1831-44.

With regard to the erection of the circular staircase, the evidences at present obvious are conflicting, and a removal of the plaster would alone enable a judgment to be formed. If it is original it seems strange that the staircase walls should not be thicker or that the staircase itself should be so large. On the other hand, some approach to the battlements or to the upper storeys of the original tower must have existed, and there would be none more likely than a "vice."

The tower did not long continue in the condition so far indicated. In the reign of Queen Elizabeth, and probably towards the close of it, vast changes were made with a view

of bringing up its comfort to the more luxurious standard of those times. The old floors were taken out and the storeys raised so that two occupied nearly the whole space of the former three, and a new storey was added. Large three, four and five-light transomed windows heavily mullioned were substituted for many of the previous ones, and a new entrance and entrance-hall were erected on the north side of the tower, with a half-timbered storey of two gables over it.

It is not quite clear whether the present oak staircase was erected at this period or not; in any case, it has been subsequently considerably tampered with. One would be disposed, on the face of it, to think its erection likely at a time when so many changes were in hand and when imposing staircases were so much in vogue, but it intrinsically bears evidence to work of a date some twenty or thirty years later. One can only suppose that the former winding stone staircase, or vice, had become dilapidated, for rooms of no importance were secured by its destruction through the two lower flights, and that the oak staircase was substituted for it.

It remains to be proved whether the side walls of the existing entrance-hall are ancient or not. Mr. Caröe is at present disposed to think that they are not ancient. It appears that in 1831 there was a half-timbered structure of three storeys, containing the oak staircase, but there is no evidence to show whether it was a recent erection or not. The entrance-hall acquired its present form between 1835 and 1844, when it was recased in deal, with elaborate carvings in the barge-boards which project from the gables, hiding the horizontal timbers of the roof, and are quite foreign to the original more solid and monumental work. Between 1835 and 1844 changes also took place in the kitchen wing, and the curved Jacobean gable was then first introduced. Subsequently to 1844 the third storey was raised over the kitchen wing, and the half-timbered gable in deal, which is at right angles to the entrance and for which there was no authority, was built. In this the details of the 1835-44 work was studiously copied. At the same time, the original kitchen chimneys, which consisted of three large detached shafts rising out of the roof, were entirely lost. In this restoration, also, the sills of the windows of the drawing and dining-rooms were lowered, and their ancient proportions were destroyed. There is no clear evidence to show whether in 1835-44, or during the later so-called restoration, the existing window was introduced in the morning-room and the curious chimney, of a factory type, raised. It is quite clear, however, that considerable changes have taken place in the north wall of this room. The present wall does not occupy the ancient position, but it cannot be surmised what the existing arrangement replaced unless excavations for foundations are made.

Referring more particularly to details, especially of the interior, it is generally to be noted that the eighteenth-century restorations have largely interfered with the antique interest of the building so far as the outward observance is concerned.

Record of Owners.

The following is a brief record of the family ownerships of the tower and manor, as disclosed by documentary evidence:—Temp. King John, Roger Fitz-Robert; Temp. King John, Henry, Duke of Lancaster; early fifteenth century—1628, Orrell; 1628-1769, Chetham; 1769-1814, Greene; 1814-35, Frere; 1835-90, Kay; 1890-1903, Appleton; 1903, Sir Lees Knowles, Bart.

It thus appears that the Orrell family were responsible for the earlier extant architectural features of the tower and also for the transformation of Queen Elizabeth's reign, and that the Kay family were mainly the instigators of the nineteenth-century restorations, although some changes are said to have been introduced during the ownership of Miss Appleton.

In further connection with these restorations it may be observed that an Elizabethan mantel-head has been used as a door-head of the lodge. This is a counterpart of the one recently found over the ancient fireplace in the second-floor passage and also of that existing in the billiard-room.

In connection with the tower, the barn at the farm should be noted. This is an excellent example, especially in its gable, of characteristic Lancashire seventeenth-century building.

It has been estimated by the architects that 50,000*l.* will be required for the purpose of the complete restoration of Selby Abbey.

NOTES AND COMMENTS.

ON December 12 the tenders for the construction of the Panama Canal will be opened. The system to be adopted is one which is seldom tried in England unless in connection with some military buildings. That is to say, the contractors will have to declare at what percentage above or below a price to be determined by engineers representing the United States Government and the contractors the contract will be accepted. Several American contractors and associations of late years have adopted what they call a percentage basis for carrying out large works, and the arrangements of the Canal Commission recognise the principle. The contractor is to do every kind of work that is required according to plans and specifications to be furnished by the chief engineer to the Commission. But the work, it is to be understood, will be confined to labour and transportation. The Commission will furnish the plant, including locomotives, electric light and power plant, and machinery of a substantial character, but not hand tools. Raw materials will also be supplied, construction tracks will be laid down, quarters for all employes will be set up as well as stores, hospitals and office buildings. The contractors' workmen can travel on the Panama Railway and on the steamship lines connected with it at about one-half the usual tariff. Water will be supplied and mess-house privileges will be arranged. The contractor, in addition to his own men, is to employ all those entered upon the pay-rolls of the Panama Commission. Payments will be made monthly for the actual construction work. The payment of the percentage will be reserved until the works are accepted as complete. Should the total cost of construction exceed the cost as estimated by the engineering committee, one-half per cent. will be deducted from the percentage for each 5,000,000 dols. by which the actual cost exceeds the estimated cost. If the cost is less than the estimated amount the contractor shall receive in addition to his percentage one-third of the difference. If the work is not completed in the stipulated time the contractor is to forfeit 100,000 dols. for each month in excess. If, on the contrary, the work is completed in less time, he will be paid a premium of 100,000 dols. a month.

THE stoneworkers in Birmingham appear to be of a particularly jealous disposition. Some time ago we offered some remarks about their endeavour to prevent contractors from having stone dressed at or near the quarries. At a time when competition is remarkably close they thought the contractor was bound to pay an extra sum for carriage and an extra sum for labour in order to satisfy the desires of Birmingham workmen. On Tuesday there was a further exhibition of their spirit. They made a complaint in the House of Commons that a teacher of modelling in the Birmingham School of Art had been working at carving on new buildings in the district, thus displacing competent stone-carvers. The President of the Board of Education was asked to intervene and to prevent the adoption of such a practice in the future. It has long been desired that efficient painters, sculptors and architects should be employed as art masters, and the Birmingham Corporation have acted wisely in seeking such men. For students, carving on a building is much more impressive than any exercise before a class. On a building it can be seen that the teacher knows what he is talking about. If under such circumstances a master could displace several workmen as was alleged, then it is obvious that the Birmingham stoneworkers are very slow coaches. The President of the Board of Education was, of course, unable to interfere, and the workmen's representative might have known as much. The committee in charge of the school know what they are about, and it can be taken for granted that no master or teacher is paid unless he renders an equivalent for his salary.

ILLUSTRATIONS.

CATHEDRAL SERIES.—MANCHESTER: NEW CHAPTER-HOUSE, FROM SOUTH-EAST.

OAK PULPIT AND CHANCEL FITTINGS, SLEEKBURN CHURCH, NORTHUMBRELAND.

THIS church has just been completed, and forms a new parish cut out of Bedlington parish. The church is built of brick with stone dressings, and seats 500. The chancel fittings, mosaic pavement and painted east window, by Messrs. CLAYTON & BELL, were the gift of an anonymous donor. The whole was carried out from designs by the diocesan architect, Mr. ARTHUR B. PLUMMER, F.R.I.B.A., of Newcastle.

NEW PREMISES, READING.

THESE buildings were designed for a firm of purveyors in Broad Street, Reading. The front consists of dark red bricks and Doulting stone. The builder was Mr. F. NEWBERRY, of Reading; the clerk of the works, Mr. F. BAKER; and the architect, Mr. G. W. WEBB, F.R.I.B.A., Reading.

THE SCOTTISH TEMPERANCE LIFE ASSURANCE CO.'S OFFICES, CHEAPSIDE, E.C.

THIS new block of buildings, the property of the Scottish Temperance Life Assurance Company, Ltd., is situated near the corner of St. Paul's Churchyard, opposite Cheapside. The lower storey is faced with grey Kenmay granite, slightly polished, the upper portion being of Portland stone, with a roof of green Westmorland slates. The whole of the rear portion of the building is faced with white glazed bricks. The lower storey is surmounted by an order of Ionic columns, flanked by superimposed oriel windows terminating in gables, which are crowned by Scottish lions rampant, supporting shields and carved in bold relief. The central feature over the main entrance terminates in a richly carved pediment, with a graceful figure emblematic of "Temperance."

The main front is supported on ferro-concrete stanchions, and the floors and beams are also constructed in ferro-concrete with the exception of the top floor, which is protected from fire risk by means of BANK's helical lathing and granite-plaster ceiling. The staircases are of ferro-concrete except that of the top floor, which is of solid teak. Internally the walls are finished in fine adamant plaster, the dados of main staircase being decorated with Rust's vitreous mosaic, of rich colour. The main entrance doorway and shop fronts are of teak, while the joiners' work and panelled dado of the company's suite of rooms on the first floor are of wainscot oak. In the finishings of the remaining offices Kauri pine is used, the floorings being of wood block.

The whole of the contract has been in the capable hands of Messrs. L. WHITEHEAD & Co., LTD., of Clapham Road, carried out from plans prepared by, and under the personal supervision of, Mr. FRED. ROWNTREE, F.R.I.B.A., of 11 Hammersmith Terrace, London, W. Mr. N. J. HILL has ably acted as clerk of works.

STAIRCASE, WEST HAM GUARDIANS' OFFICES.

THE excellent example of woodwork shown in the illustration has been carried out from Mr. DUNFORD's designs by Elliott's Moulding and Joinery Company, Ltd., Albert Works, Newbury. We have already represented examples of the company's woodwork in various styles, and Renaissance and Gothic designs can be interpreted at the works with equal spirit and truth.

NEW SOUTH WALES STATE LIBRARY.*

A MUNIFICENT bequest by a Sydney citizen of a collection of books, manuscripts, maps, engravings, &c., relating to Australia and Australasia, valued at over 100,000*l.*, has necessitated the establishment of a larger and more commodious building than that at present used for the purposes of a public library in the New South Wales metropolis. The State Parliament having voted the necessary funds for a commencement of the work, plans were prepared by the Government architect, and a site selected in a large open space, one of the great recreation grounds of the city. The complete building, of which the west wing will be devoted to the recently acquired collection, will comprise a basement, ground floor and first floor, above which will rise a spherical dome, the main façade occupying a frontage of 226 feet. The completed design shows a rectangular structure, with two inner courtyards giving light and air; the general disposition being a main front entrance, leading direct into a central reading-room, flanked on one side by the western wing, and on the other by a lofty book-stack and the accommodation generally required for the public library.

The style of architecture adopted is a modification of the Italian Renaissance, due attention being given to the exigencies of the accommodation requirements internally, the site and its surroundings, the materials available and the national character of the undertaking. The disposition of the windows is determined by the special requirements of the library, and in the majority of cases they will light the galleries and rooms from above the height of the book-presses. The building will be constructed throughout of brick and stone with steel and fireproof construction of the floors, roofs and staircases; lighting and book-lifts to be adapted for electric motive power, and heating to be effected by central heating chambers with hot-water installations. The fittings for book-shelves and exhibition cases for the display of manuscripts, &c., will be of metal, the reading tables, chairs and newspaper stands being of red cedar. The reading-room will be surmounted by the spherical dome, after the fashion of that at the British Museum, having a diameter of 66 feet and a total height from ground-floor level to base of flagstaff of 103 feet. The height of the building generally will be 55 feet from basement to parapet.

The western wing will be known as the Mitchell Library, from the name of the donor of its intended contents, and the details of the accommodation to be provided therein are as follows:—Basement—Book-stack, with sufficient height for gallery, 73 feet by 35 feet; rooms for administration, 60 feet 6 inches by 30 feet and 31 feet 6 inches by 19 feet; heating chamber, 19 feet by 15 feet. Ground floor—South reading-room, 73 feet 4 inches by 35 feet; west reading-room, 60 feet 6 inches by 30 feet; room for old Australian newspapers, 31 feet 9 inches by 19 feet 4 inches; librarian, 19 feet 6 inches by 19 feet 4 inches. First floor—South picture gallery, 73 feet 4 inches by 35 feet; west reading-room, 60 feet 6 inches by 30 feet; north manuscript-room, 48 feet by 30 feet.

The accommodation for the public library will be as subjoined:—Basement—Lending library, 70 feet 9 inches by 45 feet 6 inches; alcove to lending library, 24 feet by 27 feet; strong room for special treasures, 24 feet by 23 feet 6 inches; printer and bookbinder, 46 feet 3 inches by 46 feet; women's common room, 30 feet by 19 feet; cataloguing and administration staff, 36 feet 6 inches by 36 feet; receiving and unpacking room, 29 feet by 16 feet; heating chamber, 19 feet by 15 feet; special cart entrance and staff lavatories. Ground floor—Newspapers and magazines, 68 feet 3 inches by 30 feet; room for bound volumes and magazines, 46 feet 3 inches by 19 feet 4 inches; stationery and stores, 25 feet 9 inches by 23 feet 6 inches; catalogues and publications, 24 feet 0 inches

by 23 feet 6 inches; main entrance hall and staircase, 46 feet by 46 feet; public lavatories. First floor—Central reading-room, octagonal in shape, with angular recesses, 71 feet 6 inches by 71 feet 6 inches; alcove to same, 39 feet by 19 feet 4 inches; room for special collections, 68 feet 3 inches by 30 feet; trustees' room, 30 feet 3 inches by 19 feet 4 inches; principal librarian, 19 feet 4 inches by 15 feet 3 inches; attendant and typist. When complete there will be accommodation for nearly half a million volumes. The approximate cost of the complete building is 114,044*l.*, or about 120,000*l.* if the elevations are carried out in stone.—J. P.

SUGGESTIONS TO AUTHORS OF PAPERS.

THE American Society of Mechanical Engineers offer the following advice to members who contemplate writing papers:—

In preparing a paper for presentation before a professional society or for publication, there are some general principles, the observance of which will add greatly to the value of the work. These principles do not relate to the subject matter directly, but rather to the manner of presentation. In the first place, a paper should, and generally does, relate to some especial department of work with which the author has had experience, so that he is very apt to assume many things as matter of common knowledge, when in fact they are not nearly so familiar to most of the audience as they are to himself. It is not usually a mistake to be too clear, particularly in the preliminary statements. Avoiding undue assumptions as to the familiarity of the audience with the subject, the general form of a paper should be about as follows:—

State first, in a brief and clear manner, just what the paper is about, what the author is endeavouring to show or what he expects to prove. This introductory statement should be very brief, and having been made it should be kept in mind throughout. A paper should be about but one thing at a time, and that one thing plainly stated at the start. Then should follow the general treatment; description of work, of experiments, of opinion, &c., this portion constituting the matter usually forming the body of technical articles or papers. After this should come what may be called "proof," that is, a statement showing how the general matter immediately preceding has demonstrated what the author has set out to show. Finally there should come a very condensed summing-up, in such a form that a brief glance would enable a casual reader to grasp the substance of the paper and decide without reading the whole whether or not he wants to examine it in detail.

The introductory statement and the final conclusions should in every case enable the reader to get at the kernel of the whole matter, of which the bulk of the paper should be the detailed and expanded treatment.

The use of tables should be avoided whenever it is practicable to present results in a summarised form and where the tables do not make in themselves a distinct addition to the value of the paper.

Papers may be divided into two classes: those which give a record of experience or investigation in a formal manner, presented mainly for the purpose of putting the subject upon the official record, and those intended to arouse discussion, and presented for the very purpose of eliciting the opinions and experience of members at the meeting.

The purpose of the second of these classes cannot be successfully attained unless the original paper is in a form which permits the argument to be readily grasped. Many members do not have the opportunity of examining the paper until a few minutes before it is presented, and yet these should be able by a glance at the introduction and the conclusion to decide whether it is a subject which they can discuss. Results of investigation are sometimes given in final form only, as tables or plotted curves, and, while these are both most desirable, there should always be a general summing-up of the leading results of importance in plain language for immediate absorption by anyone.

In nearly every case these simple principles may easily be followed without imposing any hardship upon the author of the paper, and without making it necessary for him to modify in any way his own style or general method of treating a subject.

A few points relating to the reproduction of papers in

* See Illustration.

the printing office may be added, as of much importance to the publication committee.

Write plainly on one side of the paper. Number the sheets consecutively in the upper right-hand corner, and have them of a uniform size. A good size is 8½ by 11. It is desirable to have manuscript typewritten when this can be done without undue inconvenience. Give dimensions, &c., in the English system. If desirable the metric equivalents can be bracketed.

Put your full name and address on all manuscripts. Copy should be sent flat, never rolled, and preferably not even folded. Never fold illustrations intended for reproduction. Tracings may be sent rolled in mailing tubes.

All diagrams, drawings, &c., should be made on separate sheets of paper, and if possible so as to bear photographic reduction to the standard page size of the "Transactions." Photo-engraving is reliable and accurate, and greatly to be preferred to any process which requires the illustration or diagram to be redrawn. Good tracings can always be reproduced, but the reduction should not have to be more than one-third, preferably one-half, the linear dimensions of the original. Since the width of the type measure of the page is 4½ inches, a drawing to be reduced to page-width should not be more than 8 to 12 inches wide.

In making drawings intended for reproduction it is well to exaggerate the size of all numerals and dimensions, so that under reproduction on a reduced scale they will still be legible. The greater the reduction the heavier should be the lines to give sharp results. As the height of the page is 7 inches, the proportion of height to width in copy should be about 1.7 to 1. Any drawing of these proportions will, when reduced by photography, fill a page correctly. Do not use red ink, as it does not reproduce.

In selecting photographs or making photographic prints for illustrations it should be remembered that the glossy solio prints are better suited for reproduction than velox or other matter surface paper, besides bringing out all the detail in the negative to the best advantage. Photographs should not be printed too deep, and the reproductions are better made from prints of a slightly reddish tone than from those overtone to a bluish tint.

All copy intended for illustrations should be clearly marked with the title, subject and author's name, a reference to the manuscript to which it relates, and all other data of interest. This had better be written on the back in pencil; ink is apt to show through, especially when written on the back of light portions of a photograph.

The places where plates and figure references are to be inserted in the text should be indicated in the manuscript. Illustrations should only be used where necessary for the elucidation of the text—never for mere embellishment.

A list of illustrations giving their titles in brief should accompany the manuscript.

GLASGOW INSTITUTE OF ARCHITECTS.

AT the quarterly meeting of the Institute of Architects—Mr. Monro in the chair—reports of the Council as to the following matters were approved of:—"Competition issued by Greenock School Board," "Admission of members to fellowship of the R.I.B.A.," "Local Examinations held in June last," "Master Heating and Domestic Engineers and Hot-water Work," "Urgency committee's report regarding applications for R.I.B.A. Fellowship by architects in Glasgow district," &c. Delegates were appointed to attend the George Buchanan quatercentenary celebrations on November 1. It was agreed to hold a local R.I.B.A. examination in November. It was reported that the prize offered by the Institute for measured drawings in the Technical College was awarded to Mr. Archibald Revie, Flowerhill Street, Airdrie. Seventy-four drawings were submitted by sixteen competitors for this prize. The recommendation of the Council to proceed with the new constitution with a view to the members of the Glasgow Architectural Association joining this Institute was unanimously approved of. The final adjustment of the scheme is expected to be carried through at an early date.

The Manchester City Council are going to apply to the Local Government Board to alter or amend the Manchester Corporation Act, so as to enable the Corporation to borrow a further sum of 50,000*l.* for the purpose of supplying water for hydraulic pressure and for other purposes. This would lead to no expenditure of money beyond what the Corporation had already decided upon.

THE LATE STANFORD WHITE.

THE American architects are not disposed to accept all the slanders against Stanford White which his murder inspired. In the last quarterly bulletin of the American Institute of Architects are the following letters by those who knew and appreciated him and his work:—

I knew Stanford White first in his early manhood, at the time of that Renaissance of art in the New World in the seventies of the last century, when the Society of American Artists, the Art Students' League and the newer architectural associations were coming into being, and when our painting, sculpture and architecture were thrilling with a new spirit. He was an inspirer and leader from the first. Since then I have constantly been associated with him on art committees formed for the accomplishment of various patriotic purposes. He was the one we first turned to in such enterprises, and his help was always as quick and generous as it was strikingly original in result. Others, much better than I, can analyse the product of his genius—I can only say that his perception of beauty and power of creating beautiful effects were absolutely flashing in rapidity, and, I thought, absolutely certain in the production of exquisite forms and surfaces. It has seemed to me that he had the swiftest perception of beauty of any man I ever knew. His apprehension was lightning-like, and so was his execution. Those living near the scene of the exercise of his extraordinary and unflagging artistic energies know, as others hardly can, the variety and scope of his creativeness. Beside his brilliant and enormous architectural output, his picture-frames, pedestals, magazine covers and his schemes of temporary decoration were multitudinous, and each bore the mark of individuality in application and arrangement, no matter where he swooped down and snatched up the material for his combinations. Speaking of magazine covers, the one that he first made, by his style of lettering and its distribution of masses, revolutionised the magazine covers of our day. He said at the time, "They will first make fun of it and then imitate it." And they did both.

To meet Stanford White in the street and be greeted with a burst of commendation meant to many an art-worker weeks of cheerful plugging away; for everyone knew that his appreciation was as discriminating as it was hearty.

Of late years I have not seen so much of him—but to think that one cannot again get the cheer and stimulus of his genial greeting and helpful advice brings a lump in the throat.

RICHARD WATSON GILDER.

Stanford White stands on his own ground a master of the theory and practice of architecture. In his work he was stimulated by inexhaustible originality and a thorough knowledge of the essentials of classicism. Style, treatment, adaptation and artistic quality were his naturally. His sense of colour, proportion and completeness were distinguished and refined. Given means he did monumental things, and with the slightest of means he produced elegance, charm and art. His art, art criticism and appreciation compel the respect and affection of all who can see and feel, and the recognition of his genius, which came early, will grow while civilisation lasts. He displayed superb individuality both in work and play, and his sturdy friendships, his generous deeds and noble, lovable self will for ever remain his pre-eminent monument.

CHARLES L. FREER.

Stanford White was a genuine lover of antique tapestries of the highest order. He could seize their principal decorative merits at a glance, and knew without any hesitation which possessed the greatest artistic value and importance. The subjects represented were in the main immaterial to him provided the quality of the point, the softness and delicacy of the colouring and the general treatment appealed to his refined and cultured taste. We have examined many celebrated antique tapestries together, and his enlightened comments upon their merits exhibited the excellence of his judgment and the high standard of his taste.

CHARLES M. FFOULKE.

Stanford White I knew mainly through the frequent and spontaneous praise given to his work by Mr. McKim. During several years of close association with the latter I never heard him speak of Mr. White except in terms of admiration of his genius. While in his own work Mr. McKim deliberately exercises the quality of restraint, he nevertheless enjoys to the full the exuberance and the sumptuousness displayed by his friend and partner. Washington is the richer for the Patterson house on Dupont Circle, a piece of Domestic architecture in which Mr. White has well expressed the joyousness of the social life at the

nation's capitol, and also has given to his work that suggestion of the tropics which is present in the climate of the city. Detroit rejoices in two of his creations—the State Savings Bank, which realises what Mr. Burnham would term "the commercial advantages of beauty," and the Hecker Mausoleum—an exquisite little Greek temple, well placed at the end of a long vista in a well-managed setting of green. Mr. White had been selected as the architect of an important building in Washington that would have called into play all his highest qualities, but now another hand must do that work.

CHARLES MOORE.

I was the personal assistant of Stanford White about twenty-five years ago, shortly after he became a partner in the firm of McKim, Mead & White. I was immensely impressed with him then as a man of extraordinary ability and of the most attractive and engaging personality. I have never had occasion to revise this opinion. That he was a great artist is now conceded by all. We in the office knew it then and predicted for him the great career which he fulfilled. A more kind and generous man it has never been my experience to meet. There was absolutely not a particle of malice in his disposition. I never heard him speak slightly or contemptuously of any man. He was as generous in his thought as he was in his work. He gave of himself fully and enthusiastically to everything he undertook. He was the sincere and helpful friend of every creative artist, of every struggling young man or woman, whether architect, painter, sculptor, actor, poet or artisan, if they showed an intensity of intention and had the least particle of creative instinct, and many such owe to him their success in life. He was a kindly critic, and his criticism was always constructive and helpful. He was one of the most ingenious men I ever knew in solving practical problems of architectural design. In that sense he was one of the most "practical" artists in his profession. He was so broad in his taste that no beautiful thing failed to receive his admiration and his praise. He was a man through and through, with a man's faults, but those faults were greatly overbalanced by more than an ordinary man's ability and generosity. In short, he was one of those big men mentally and physically who are fitted by nature for important work, and who successfully accomplish it. All who came in contact with him felt the impulse of an unusually strong nature. I have often said and thought that the word "genius" could be more aptly applied to Stanford White than to any other artist of his time. In his death the world has met a great loss.

CASS GILBERT.

Mr. White was a great man as well as a great artist. No one ever failed to get instant recognition from him of any good thing he had done. He looked for good things in others' work, and where he found them he made haste to personally tell the designer how pleased he was. This magnanimity in him was the expression of deep sincerity never found except in men of high quality. He was a constructive critic, which means that he was controlled by his heart as much as by his splendid intellect. The belief that Stanford White loved me will ever remain a source of great happiness.

D. H. BURNHAM.

STANFORD WHITE.—Huge of heart and strong of soul, inspired, dauntless, brave; full of love for art; broad, cultured and kind. In his work he leaves a priceless heritage to all of us.

WM. S. EAMES.

Many years ago it was my good fortune to be one of the many young men who have come under the magic influence of that great artist, Stanford White. His scope of decorative ideas was unbounded, and his resourcefulness in design surmounted all difficulties. His criticism, fertile with inspiring suggestions, fired the imagination of his admiring students. He had for beauty such a passion and such perception that he saw it where it was—in a half-hidden flower peeping out at the sun and in the thunder-cloud darkening the mountain top—and he made men see it with new eyes. The world of art owes him greater homage than it will ever pay.

WM. A. BORING.

My first recollection of Stanford White was when he visited a building as Richardson's representative. I recall him tall and thin with florid complexion, energetic, thinking of the artistic expression of the work. The eagerness with which he secured colours and transferred the beautiful tones of the evening sky to paper, placing in the foreground the pinnacle and gargoyles of the building artistically against the golden red, remains vividly impressed on my mind. An enthusiastic Richardsonian when the master died, I was anxious that the firm of McKim, Mead & White should develop and perfect the Byzantine of Richardson into an American style. I was gratified that my desires were not

realised after this firm had made its individual impression on art. Their forceful individuality were first brought to my attention through the work of Stanford White in the base of the Saint-Gaudens *Farragut*, a creation artistic, beautiful and in harmony with the sea and the figure which stands firmly upon it. The exhedra and background of Adams tomb, dignified and impressive, I felt was with bronze figure by Saint-Gaudens the most impressive and artistic mortuary memorial produced. Afterwards came the Madison Square Tower with its perfect proportions, refined details and beautiful silhouette. I mentally resented insinuations that it was only a copy of the Giralda Tower as I resented the imputation that Shakespeare was a plagiarist because the plot and outline of his plays may be traced to Boccaccio's "Decameron" and other stories. The individuality of expression, the harmony in composition, the artistic feeling introduced has made each production, in drama and architecture, a new creation for the elevation of mankind. Because of my interest in Thornton's work I feel a personal gratitude to Stanford White for his grasp of the spirit of Thornton, the architect, and Jefferson, the intelligent client, in the recent additions to and restorations of the University of Virginia. He is the only man since the days of Jefferson who appears to have appreciated the beauty of the old buildings and the dignity of the formal grouping.

A recent visit to New York depressed me because of the constant reminders of his loss. Going up Twenty-third Street the Madison Square Tower came into view; the man who designed it would never delight us with another artistic production. I passed the Farragut statue; the man who put his spirit into the base could never add to our artistic growth. The Madison Square church was next noticed; he will not continue his studies in exterior colour to the advantage of art. The *Herald* building soon came into view; the country will never again have his refined productions in terra-cotta and marble. I came down Fifth Avenue; the Gorham and Tiffany buildings—so different in character, so dignified in proportion, so refined in detail—we no longer have his skill to improve the design of our business structures. On the way from Broadway to Fifth Avenue I noticed the Lamb's Club; we will not now have his much needed guidance in the refined and true solution of the Georgian style. Passing down Madison Avenue, Tiffany's residence, reminded me that we would never again have his individual and refined hand to lead us to better work. Finally, St. Bartholomew's new front, with its charming combination of coloured marbles, sandstones and bronze, its true feeling for the best in the antique, its combination of refined carving and sculpture; no longer would he continue the production of works of art for our pleasure and enlightenment. During this same visit, I called upon an artisan in carving. He exhibited a carved frame which he had been making for Stanford White. He said, "I have lost my most able and appreciative adviser on artistic work of this character." A noted expert in tapestries deplored his sudden loss to the country, as he so thoroughly appreciated the beauties of tapestries and had done so much to introduce their refining effects.

A short time before I had seen Stanford White in all his physical vigour, in all his artistic energy, in his prime glad to appreciate, eager to produce or obtain the beautiful. The need in the art world of capable men, refined men to guide aright the present enormous expenditures in this country towards artistic ends, is so great, it is deplorable that we should lose the continued labours of such a man as Stanford White.

GLENN BROWN.

HERALDRY IN RELATION TO THE APPLIED ARTS.*

HERALDRY grew out of the widespread use of personal badges, a practice which had existed from the earliest historic times, and became crystallised into a system of carefully regulated devices somewhere about the twelfth century. The closing up of the head armour until it wholly covered the face also afforded an excellent reason for using distinctive marks by which the wearer might be known, and the added value that was thus acquired by personal badges was given further expression by the pageantry of the tournament, whose splendour always comes to mind as the inevitable background of early heraldry.

Though in its beginning heraldry essentially marked the

* From the Cantor lecture by George W. Eve, published (with illustrations) in the *Journal of the Society of Arts*.

fighting men, its decorative quality and compact significance extended its use in the course of time to other parts of the community, civil and religious, until it represented every important interest—cities and boroughs, trade guilds and simple merchants, as well as kings and nobles and other components of the feudal system with which heraldry was at first identified. This extension of its scope was particularly marked at the period of the Renaissance, to which much of the modern use of heraldry may be referred.

Symbolism, which pervaded the whole life of the Middle Ages and imparted beautiful meanings to everything, naturally ascribed spiritual qualities to heraldic bearings, and such symbolism was, no doubt, one of the powerful influences in the choice of armorials in early times. But although the symbolic meaning of the heraldic figures continued to be tabulated in treatises until a late period, the influence constantly tended to become weaker, until it practically ceased, or became merged in an allusive rather than a purely symbolic quality. Some chance object would be adopted as a memento of a notable deed, and even when the symbolic reason had influenced the first bearer, his subsequent deeds and the glory that he acquired built up round his arms a family sanctity, that in time quite overshadowed the symbolic meaning.

Purely symbolic charges, however, still occur, such as the bee as an emblem of industry, the ship for commerce, the palm of victory and the dove for peace, among the many others that will readily come to mind.

A noteworthy feature of the early work, the work on whose excellence in strength, simplicity and expressiveness we are all, I think, agreed, was the common-sense nature of the methods that were followed. That is to say, the artist knew what he was doing and why he did it. For good heraldry is never at variance with sound common sense, and is always able to give a reasonable answer to a fair question. Therefore, in the study of old work, in order the better to learn how to do our own, we need never hesitate to inquire why things are so. And the knowledge that is thereby gained cannot fail to benefit the work.

In the course of time heraldic devices were displayed on many parts of the armour, but it was the shield that was and still is of primary importance. Before proceeding to consider its form and the evolution which it has undergone, it will be well to mention that the shape of a shield has, in general, no heraldic significance whatever (the sole exception, the lozenge shape on which some ladies' armorials are borne, being put aside for the present). That is to say, a given coat-of-arms may be placed on any shaped shield that is artistically fitting, without in any way varying the statement of heraldic fact. The consequent power of choice, in the shield shape, is a very valuable one, in connection with the adaptation of the shields to their bearings, to the various spaces they occupy, and to the character of their surroundings.

Let us now consider this principal heraldic object, the shield; as an actual defence, such as it would appear in representations of historical events, and afterwards as developed into decorative forms. From Classic times downwards it was an object of peculiar regard, as a part of a man's armour which was especially identified with its owner and which it was dishonour to lose. It had an interest that was almost a sanctity, and it was, therefore, natural that an emblem of such supreme importance as the personal device should find space for its expression on an already symbolic shield. Also its detachability and the ease with which it could be displayed hung by its belt from some convenient support made it an appropriate representative of its owner, and as such it was considered and treated in a variety of ways, honourable and otherwise.

The shape with which regular heraldry was first associated is that known as the Norman shield, which was tall and narrow, actually about 4 feet high and about half that in width, and being strongly curved from side to side, partially encircled the body. It was pointed at the foot and could be thrust into the ground and held in position by the fighting man when he was dismounted. Such shields were made of strong thicknesses of leather covering a wooden substructure and strengthened with bands and bosses of metal, and it was from these reinforcing pieces that certain plain heraldic forms, called ordinaries, are sometimes thought to be derived. Among the earliest examples of the regularly charged Norman shield is one that was executed, in *champlevé* enamel, on the magnificent tomb of Geoffrey Plantagenet, Count of Anjou, the progenitor of our Plantagenet kings. In this typical case the shield is very large, extending from the shoulder to the ankle, the

top edge is straight, and forms right angles with the upper parts of the sides, the corners being slightly rounded. In other cases, of somewhat similar shields, the top is semi-circular. This latter form survived for a considerable time and is still used in Italy for decorative shields.

The difficulty of managing the long shield when it was used by a mounted man led to its gradual shortening, until by the end of the twelfth century it was about the length of the torso, and later still became much smaller and nearly equilateral. No doubt the increased defensive power of the whole armour contributed to the decrease in the size of the shield.

The quality of the curves which form the sides varied considerably, in some cases being rather full, swelling slightly from the rounded upper corners and becoming flatter as they met to form the point. Others more nearly approached the flat lines of an equilateral triangle, the upper corners being distinctly rounded, though they became more angular in later examples. For a considerable period the lines of the sides began their curvature quite at the top, until at the beginning of the fourteenth century they began in straight lines, which formed right angles at the top, and at about a quarter of the height developed into the point curves. This form is well known as the "heater" shape, from its resemblance to the heater of a smoothing iron, and suits bearings that are simple, especially such as are not crowded in the base or lower part of the shield. It of course goes well with Gothic surroundings, but may seem somewhat affected among modern work. I mean an affectation of antiquity. It seems to demand strong, simple treatment of the mantling and other accessories.

The next shape is, perhaps, the most useful of all the plain shields, and so it has never ceased to be employed since its inception in the fourteenth century. It is nearly square, about five parts in height to four in width, the base being round, or nearly so—that is to say, the base lines meet in a blunt point, or one semicircular line suffices for the whole base. This shape is equally suitable to most bearings, either single coats or the more complicated combinations of quartered arms which sometimes present such difficulty. It is thus peculiarly suitable to series of arms which naturally vary in character.

There were also large square shields, called *pavoises*, used for fighting on foot, and having a projecting rib down the middle. Another form had, instead of the broad rib, a sharp ridge or *arris*. This is said to be the last to have been used in actual battle, and probably suggested the similar line which was so marked a feature in some of the later decorative shields.

It should therefore be noted that, although shields are represented flatly in most cases on the monuments and seals, they were in actual fact curved in one or more directions; and this curvature may, of course, be extremely valuable, especially in modelled work, from the play of light and shade and the variety of line that the surfaces afford. As was natural, the simple curvatures of the early shields were dictated by the practical necessities of defence, and to the forms which resulted the later decorative shields gave fanciful development. The general principle of all defence is that it is easier to deflect a blow than to directly resist it, and in the application of this principle the curve of the shield was at first from side to side, as we have seen; then in order to prevent a blow from glancing downwards, the base of the shield was made to project, so that the attacking point was carried on to the sloping sides, from which it slid off. Finally the top was also brought slightly forward so that the whole shield had a double curvature, convex from side to side and concave perpendicularly.

It remains to describe a form of actual shield which greatly influenced those decorative escutcheons which were designed in such great variety in the fifteenth and sixteenth centuries, by which time the battle use of the shield had become obsolete, and when the present freedom of shield design may be said to have begun. This was the shield *à bouche*, the special tournament defence, with a gap in its right-hand margin, through which the lance could be placed so that the shield fitted closely against the guard-plate of the weapon, thereby making a closer defence. This gap, or embouchure, was sometimes at the top of the shield, but was more usually at the side. In a great many instances one or other of the various shapes of tournament shield was followed fairly closely in the seals and in other forms of decorative work, and the cusped form also came into extensive use, which continued into the first half of the sixteenth century. Further variety was obtained by the addition of foliated decoration, which followed the lines of

the shield, as in that of Henry V. on his stall plate in St. George's Chapel, Windsor.

The distinctive *bouche*, however, perhaps conveys too direct an allusion to the tournament to harmonise with merely decorative modern use; but by omitting the *bouche* and duplicating the other side of the shield the objection is avoided and some good forms may be arrived at.

Another method by which the tournament shield was freely developed into purely decorative form is shown when the *bouche* side of the shield was made to give but a mere indication of the opening, while in others it merged into a line swinging without a break from the projecting point. In this way an infinity of shield shapes was devised, and were either left in their simple line or further ornamented with foliation, which thus completed the transition from the actual motive to the decorative equivalent. Such a foliated shield occurs in the large wood-cut of the arms of Herr Kress of Kressenstein, who was one of the Nuremberg friends of Dürer.

In the works of Martin Schöngauer, Israel van Meckenem, Albert Dürer, the Behams, Burghmair, Virgil Solis, Aldegrever and Jost Amman, among others, an enormous number of ornamental shield shapes occur, which are evolutions from the tournament form in some of the ways that I have indicated, with the added influence of the classically derived scrolls and volutes of contemporary decoration.

It is easy to deduce from the foregoing that a space of any shape may serve as a field for a coat-of-arms. But, as I have already indicated, there is the unfortunate exception in the lozenge-shaped shield, on which it has become customary to depict the arms of widows and of unmarried ladies. In most instances it is exceedingly difficult, if not impossible, to adjust its bearings to it in a satisfactory way, especially where chevrons between charges are concerned, though this difficulty may be somewhat lessened by substituting curves for the straight outline of the lozenge; and here it may be usefully noted that its sides may be of any form, and that its angles may be rounded to a very considerable extent so long as the general idea of a lozenge-shaped space is present.

In designing or choosing a shield shape it must be remembered that the first duty of the shield is to display its bearings in the most effective way with the greatest distinctness and decorative effect. It should also be in itself of pleasant and suitable shape in its relation to the lines and character of the mantling or other decoration that may enclose it, and to the helmets, coronets or other objects that may form part of a general composition.

The natural convexity of the early shields is, as you know, generally ignored in their artistic rendering; in illumination especially they are represented as flat, but in sculpture, in seal engraving (which is a form of sculpture) and in engraving a concave form is frequently employed, perhaps suggested by the hollow shields or, as is more likely, by the nature of the work itself.

This is extremely valuable, for on a convex surface the lights on the bearings may become confused in the broad light on the shield, and their shadow sides be partially or wholly lost in its shadow, whereas the concave surface distributes the light and shade over the whole field in a kind of decorative counterchange. The shadow under the lighted rim gives value to the lighted side of the charges, whose definition is completed on the other side by their shadows in contrast with the field, which in that part comes forward and takes light.

Before proceeding to discuss the treatment of the bearings of the shield it will be necessary to say a few words on the subject of heraldic language. Heraldry, like other systems of knowledge, requires the use of technical terms, and these sometimes act, at first sight, as a deterrent to its study. Such terms, however, have become needlessly complicated, for most of them that one finds in treatises on the subject are of such infrequent use that they may be put aside in a general way, to be looked up in a glossary when occasion requires. But there are certain principal terms which it is necessary to keep in mind. For practical purposes the names of objects, the means of expressing their relative positions and of defining the heraldic poses of the animals will suffice, and this is comparatively simple. The great point to keep in mind is that there should be no doubt or inaccuracy about the essential heraldic facts on the one hand, and no unnecessary insistence on unimportant detail on the other. Heraldry is naturally governed by its significance, and consequently artistic variation is permissible only so far as heraldic or symbolic statement is not inter-

fered with, for in working from a sketch which is often a merely diagrammatic indication of the armorials, this question of how far it may be improved in an artistic sense, without impairing its validity as heraldry, will continually arise. And it will be found that its interpretation will be greatly helped by the technical heraldic description called *Blazon*, for in it will be found all that is really essential. It is not desirable perhaps further to describe the method here; it will be found described at more or less length in all treatises on heraldry, and with a little trouble will be easily understood.

The simplest coat of arms that is possible is, of course, one which consists solely of a plain surface of one tincture, such as the plain golden shield of Pope Alexander III. in the twelfth century, or the simple ermine shield of Brittany, which occurs so frequently in French heraldic decoration as the arms of Anne of Brittany, the queen of Louis XII.

The field, or surface of the shield, may be divided in various directions, and so become parti-coloured; and though the exigencies of material, as in sculpture, may cause the spaces to be indicated by sunk planes, they are in theory but divisions of the surface, and are so represented in painting; also in sculpture they may be divided by raised (or by incised) lines; but the countersinking is better. The simple charges, the perpendicular pale, the horizontal fess, the oblique bend, the borders round the shield, the cross, and so forth—forms which normally extend to the edges of the shield, and are called *ordinaries*—are considered to be superposed on the surface, and in sculpture are frequently accented by being bevelled at their edges, which thus acquire more emphatic light and shade.

The proportion of the ordinaries to other charges and to the field is obviously a most important point, and the first thing to do in this connection is to quite put out of mind any idea whatever of a fixed scale. The only true principle is that which makes for unmistakable clearness of definition by means of artistic balance and good distribution, suitably expressed in the material concerned. It was on this principle that the Mediæval designers worked, with that common-sense regard for practical necessities which they always combined with their extraordinary instinct for design. The tomb of Louis Robsart, Lord Bouchier, in Westminster, may be taken as an example, and in this particular attention should be given to the engrailed cross. It is very much narrower than seventeenth-century writers prescribed; there is no question of exactly one-third or one-fifth of the surface; but there is also no question of its sufficing clearness of definition, while ample space is left for the other charges, the water bougets, and for their treatment with appropriate largeness, the whole effect being that of a well-decorated space of which all the details are distinctly legible.

Since we are dealing with the subject mainly with a view to the interpretation of a provided sketch, it will be well to keep in mind the principal points concerning the arrangement of charges on a shield. Their number must be noted, for, except when a field is said to be powdered or sown, semé, with a charge many times repeated (in which case the number is indefinite), the number of the charges is of primary heraldic importance. The order in which charges are arranged next claims attention. This, like their number and heraldic disposition, must never be tampered with; their size, however, and their consequent distance apart may be anything within the compass of the shield that the artist wishes.

Of all the various charges on heraldic shields the animals naturally attract most attention, and the lion in particular is of especial interest, not only for the variety of its pose and treatment, in which connection it serves as a telling example of the characteristics and changes of heraldic style, but as the principal part in the royal arms of both England and Scotland, it is a figure with which every art worker has sooner or later to deal, and it therefore presents a very suitable means of showing what is essential in heraldic pose, as well as what is to be aimed at in artistic treatment.

It is, of course, easy to understand that when the number of persons bearing symbolic emblems were few, he who bore a lion, for instance (having no other lions in his neighbourhood), would have the animal represented in any pose that suited the space that it had to occupy, so that in an upright space like that of a pointed shield, the beast would be ramping upright, but in a horizontal space would assume a horizontal attitude, and this is exactly what happened in early times on warriors' shields and headpieces. The thing was a lion, and that was enough. When, however,

lion-bearing personages increased in number, some means of distinguishing one from another became obviously necessary, and among those means set variations of pose were found most effectual, and so they became endowed with a regular heraldic significance, and constituted valid distinction between otherwise similar bearings.

This will suffice to show the importance of so rendering a given coat-of-arms as to avoid any alteration that may, as it sometimes does, result in turning one coat into another. I will therefore endeavour, as shortly as I can, to explain what is heraldically essential in animal pose. This may be broadly classed under three heads:—(1) The general direction of the animal, (2) the arrangement of its limbs, and (3) the pose of the head. Putting aside for the moment certain comparatively unusual attitudes, which will be referred to later, we find that the general pose divides itself into two classes, one of them more or less perpendicular in direction, rampant, and the other horizontal, passant.

As I have indicated, both these poses occur in the royal arms, in those of Scotland a lion rampant within a tressure, and of England three lions passant-guardant in pale. The arrangement of the limbs is somewhat similar in both positions, all four legs being clearly separate, one forepaw being strongly raised in an attitude of vigorous rage. This clear division of the limbs is heraldically important, for if, for instance, the hind legs of a rampant lion are placed close together, the beast is said to be saliant (leaping) instead of rampant, and is a different bearing altogether. The passant lion becomes statant when the four legs are placed as though the animal were standing on all of them, and this is, of course, another definite and distinctive pose. One of the before-mentioned attitudes, saliant, is very rare, being probably of comparatively recent differentiation from rampant, and the other pose, statant, usually occurs in crests. It is necessary, however, to keep them in mind in order to avoid confusion.

We have now to consider the pose of the head, and it must be understood, in the first place, that in heraldry an animal's head is always meant to be in profile—the simplest way in which an object can be drawn—unless some other position is specified. Other positions of the head are full-faced, gardant, as in the last slide, and another looking backwards, a comparatively rare pose, which is known as regardant. A little latitude is permitted in modification of these three distinctive positions of the head, but only so far as escapes all possibility of misunderstanding. Thus the profile head may be turned until the further brow is visible. On the other hand, a beast that is in the gardant position need not be quite full-faced.

The positions that have been described, viz. rampant and passant, are those commonly met with; but besides the somewhat similar positions of saliant and statant, which have also been mentioned, there are others, such as sejant, sitting on the haunches with the forelegs upright, like Stevens's lion, or with one leg employed in supporting an object, such as the shield that is held by the well-known lion by Donatello, in Florence; and couchant, lying with the forelegs extended, the attitude of Landseer's lions in Trafalgar Square.

Much of this may seem unpleasantly restrictive of artistic freedom, but as it is essential to the accurate rendering of the subject, it is an inevitable condition of heraldic design. It remains to the artist to make the heraldic statement in as beautiful and expressive way as he can. Let us therefore consider some of the qualities that go to make a satisfactory work.

The placing of the animals as charges will naturally present most difficulties, for whatever their pose they must occupy their spaces in such a way as to express their character with the utmost distinctness, while at the same time covering the field in a decorative manner. That is to say, good distribution is of the greatest importance in all good heraldry. Very excellent examples of it are to be found in most of the work of the Mediæval period, especially in the fourteenth century. In fact, good distribution and vigorous expression are its most characteristic points. The ceremonial shield that was borne in the funeral procession of Edward the Black Prince, and was afterwards hung over his tomb in Canterbury Cathedral, and the no less remarkable sculptured shield of his uncle, Prince John of Eltham, in Westminster Abbey, are instances in point. Notice there the adaptation of the figures to the varying demands of space, the preservation of the heraldic pose and the great spirit of the whole work. Other excellent examples may be found on the contemporary seals.

This shield shows among other excellent qualities the characteristic attenuation of the animals, which is a most striking feature of Mediæval work, and is a good instance of the adaptation of figures to the condition of their heraldic use, an ever-present proof of the reasonableness of the Mediæval artist. In the earlier shields the figures were done with a considerable degree of reference to natural form, very simply expressed, like those of the Saracenic silks. Soon, however, the necessity for clear definition of the bearings on a shield or banner suggested the additional emphasis of the figures in their fields and resulted in the peculiarly heraldic character which makes so much for practical decorative effect. In this as in so many other cases, a common-sense regard for the practical quality, legibility, resulted in the effective attainment of the decorative one.

As guides to setting out lions on shields, a sort of skeleton method is often found useful in which simple lines indicating the general direction and placing are drawn, and the forms are built up on these in due relation to the field and to each other.

The drawing of heraldic figures should be firm and decided, every line being made to do the most of which it is capable in expressiveness of character and in decorative force. The pose of the figures, in complying with the heraldic rules and with the requirements of ornamental distribution, should still be in accordance with anatomical possibilities, and by this I mean that physical distortion for the purpose of getting a figure into a space is offensive and unnecessary.

In thus arranging the limbs to occupy satisfactorily the given space, the play of the shoulder is very important, not only in the strong forward reach of the uppermost foreleg, in the positions of passant and rampant, but also in the drawing back of the other foreleg on the body, where the narrowness of the containing space requires it.

It will, therefore, be desirable to study animal anatomy, at least so far as will fix in the mind the position of the principal joints and their range of movement, as well as the more important muscles and other surface characteristics. The muscular masses of the shoulder play an important part in the suggestion of power, and this may be helped by the treatment of the mane. That very distinctive leonine feature usually covers the whole forepart of the body to the line of the shoulder where it joins the trunk; but if it is disposed in the natural way, covering the neck and chest but leaving the shoulder bare, as in some wild lions and in those of the Assyrian and other eastern sculptures, the modelling of the muscular shoulder is emphasised and the suggestion of strength is more marked. It is not, of course, intended to import such forms unchanged into a shield, but only that the lesson of simple and direct expression of leonine power and character should be learnt from them.

Characterisation should be strong and definite, and, above all, the expression of vigour should always be intended. Vigour in the animals is, perhaps, the most striking quality of good heraldry, however different it may be in style and period. An unerring sign of decline in heraldic art is always the loss of vitality in the animals. The Mediæval designer was, of course, influenced by the symbolic qualities of courage, magnanimity and power that were ascribed to the lion, and he tried, no doubt, to express them, but vigour seems to have been his principal aim; and if in the pursuit of it he exaggerated the toes into forms that were claw-like, we forgive the grotesqueness for the sake of the supreme vitality that resulted.

The treatment of the wide-stretched paw is no unimportant part of the expression of that vigorous rage which is the character and sanction of the principal heraldic poses, and without which they become feebly ridiculous. Also these claw-like toes had full warrant in nature, and, if we look at the paw of the domestic cat when it stretches itself, we shall get a very good idea of what the paw of a lion would look like in vigorous action. The toes divide to a remarkable extent, showing much of the character of the Mediæval form.

To the absence of vigour the lions that we know so well in ordinary commercial heraldry owe their absurd appearance. Their original designers seem to have looked at a tame beast in a menagerie, and (determined to do something more natural than those wild Gothic fellows) looked at him as he stood blinking in his quiescent state, drew him propped up into heraldic attitudes and let him go at that. The next slide shows that this treatment began by the Italians as long ago as the fifteenth century, and we copied them. The vital distinction between good and bad treat-

ment of heraldic animals consists in the recognition of something beyond mere form, namely, the expression of emotion, of the heraldic emotion of active rage. And this may be seen in the Gothic heraldry of the Middle Ages, in its time of strength and in its decline, no less than in the comparison of, say, the lions of Schongauer and Dürer with those of Della Robbia.

Before leaving the lion it will be well to point out explicitly what has already been implied, viz. the desirability of filling the field space to a satisfactory extent. Returning to the Black Prince's shield, we remember that the English lions stretch from side to side, and thus decorate the whole surface.

Neglect of this was a conspicuous feature of the work of last century, when it became customary to depict these same lions of England in a column down the middle of their field with a great blank space on either side. There has been some gradual improvement (in the heraldry of coinage, for example), but in this and some other respects the courage to go to the full extent of the decorative possibilities seems still to be lacking.

To sum up the qualities that are to be aimed at in depicting a shield of arms, they are:—A shape of shield that is suitable to all the circumstances of its use and surroundings. Clear definition of its bearings by means of direct and simple drawing, and just proportion between the charges and their fields. Good distribution over the shield space, and in the animals strong characterisation combined with the utmost vigour that can be expressed.

SCOTTISH MODERN ARTS ASSOCIATION.

THE committee of the new Association have issued a statement, in which it is said:—"It has long been admitted that the existence in Scotland of a recognised School of Painters, and the absence of any Society with funds to secure representative specimens of its best modern work as national possessions, constitutes an anomaly of the most unusual description.

"Year by year Scottish painters earn the critical appreciation of connoisseurs and buyers throughout Europe and America—for proof of which it is only necessary to consult the records of the various national and international exhibitions of art which have been held during recent years, at the last of which, of the four medals awarded, the three first were taken by Scotsmen and the fourth by an artist who had been trained in this country.

"It may be said that there is not in foreign countries that neglect of Scottish art which we are compelled to deplore in our own, which is evidenced by the fact that there is not a gallery in Scotland to which the student of art, professional or amateur, resident or visiting, can be referred, as containing a permanent collection of work adequately representative of modern Scottish art. Even if we include galleries south of the Tweed which are ostensibly representative of British art, such as the Tate Gallery in London, it is clear that little note is taken of the majority of those painters who are considered by Scotsmen to be an essential part of our national artistic asset. The absence of a gallery of modern Scottish art is largely responsible for the indifference and ignorance which prevails regarding the Scottish school of painting.

"To remove this limitation to our national endeavour and to enrich our national treasures, the Scottish Modern Arts Association has been formed, whose aim it will be to secure, year by year, such works of Scottish artists as a thoroughly qualified and unbiassed committee of selection may judge to be worthy of purchase; and, secondly, as funds permit to extend its operations by purchasing contemporary works of outstanding interest, other than Scottish, and so to form for Scotland an adequate collection of modern art in its more comprehensive sense.

"It has been judged that the present time is extremely favourable for the object in hand. The changes that are about to take place in the constitution of the authoritative body which, to a great extent, controls national art matters in Scotland, and the legislation affecting the National Gallery, make the moment almost a psychological one, and it is hoped that neither diffidence nor delay will prevent an immediate practical outcome of our endeavours.

"To realise to the full what the absence of such a body as the one just constituted means to art in Scotland, it is only necessary to take a glance backward and see to what extent the generations of art immediately preceding the present are represented in the national collections. Of the

Scottish painters of the nineteenth century, only Raeburn, Philip, Thomas Duncan, and possibly Thomson of Duddingston, are adequately represented in the Scottish National Gallery. Of Watson, Alexander Fraser, Sam Bough, George Paul Chambers, Erskine Nicol and Tom Faed—to mention only a few—there is a very meagre representation, so meagre indeed as to remove its representative character. Of such distinguished Scottish painters as Wintour, Milne Donald, Pettie, George Manson, Colin Hunter, Arthur Melville and Robert Brough, there is not a single specimen. A similar remark applies to those living artists, the bulk of whose work may be safely called complete. The sequel to such a condition of affairs is obvious. The blank to be faced by future generations, under existing circumstances, promises to be no less striking. It is the removal of this blemish upon our national patriotism, taste and good sense that the present Association sets out to achieve.

"It may be indicated from the first that the movement being undertaken is in no sense a local one, but is essentially of a national character. The Association will give no preference to any centre or school of art in Scotland, academic or extramural, but will be prepared to treat all schools and all individuals without prejudice. Although it will naturally follow that the collection of pictures will eventually be housed in the capital city, yet will it be in no way an Edinburgh, but a national collection, the possession, not of a city or a corporation, but of a people.

"When dealing with living artists, the pictures will be bought, if possible, direct from the artists themselves, or through the medium of the public academy or exhibition in which the pictures hang at the time of purchase, and at such a price as will prevent any attempt to use the Association for merely monetary ends. Probably some scheme similar to the one employed by the Luxembourg Gallery in Paris may be followed. In the latter case the purchase price is considerably below the ordinary sum named by the artist to the private purchaser. The following of such a plan, it is believed, would be in accordance with the wishes of the majority of the artists themselves.

"In the meantime it may be mentioned generally that the idea is (1) to raise a capital sum which may serve as an endowment fund, and (2) to institute a membership which shall be constituted by a minimum subscription of one guinea per annum. To illustrate broadly the outcome of such a plan, it may be stated that a capital sum of, say, 12,000*l.* would realise an income of some 400*l.* a year, and the subscription accruing from a membership of 600 added to this interest would secure at least a thousand pounds (1,000*l.*) per annum for the objects of the Association. It is hoped that the response to our appeals will be more extensive, but even with the sum indicated the Association could proceed to the purchase of works of art.

"It is only necessary to add that the Association will be prepared to consider, and, if desirable, to accept any legacies or works of art for the purposes of the Scottish National Art Fund, and in other ways to carry out any scheme which it considers within its scope for the furtherance of art in Scotland.

"We should be glad if you would reply to our request at your earliest convenience.—Yours,

Patrick W. Adam, Robert Alexander, Walter Armstrong, Balcarres, G. Baldwin Brown, Robert Burns, James Cadenhead, D. Y. Cameron, Thomas D. Gibson Carmichael, James Cooper, J. J. Cowan, John R. Finlay, James Guthrie, Duddingstone Herdman, Arthur Kay, Kinross, J. H. Lorimer, C. H. Mackie, W. D. M'Kay, Ian Malcolm, John Stirling Maxwell, J. Campbell Mitchell, Patrick Murray, R. B. Nisbet, J. Campbell Noble, James Paterson, R. W. Philip, David Robertson, Alexander Roche, Hugh Shaw Stewart, Harold Tarbolton, Edward Tennant, William Walls, E. A. Walton, A. Stodart Walker, convener,

Members of interim executive committee."

The "*Burlington Magazine*" has been appreciated by connoisseurs. But the price, which is half a crown, prevents a great many people from taking advantage of the information it contains. The conductors have issued a shilling edition which is to contain both articles and illustrations from the dearer edition. The first number is a creditable specimen, and the plate from the new *Madonna*, by Raphael, in the National Gallery, is by itself enough to insure the success of the experiment.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the opening meeting of the session the president, Mr. James Lochhead, delivered an address to the members. He referred to the gratifying increase in membership and the excellent quality of the papers delivered by members and others to the Association. The address which followed partook of the nature of a plea for greater alliance in the practice and study of architecture, his endeavour being to emphasise the necessity for a thorough understanding and collaboration not only between architects and contractors, but between architects themselves in the pursuit of their ancient and honourable profession. It was regrettable that the public appreciation of architecture fell so short of the attention bestowed on the sister arts. That the negative qualities in the attitude of the public to architecture, as the first consideration, and the public's appreciation of architecture have been a persistent thorn in the flesh of the profession is manifest by the murmurings which have gone forth, especially of recent years, and that they are not merely the plaint of the ubiquitous grumbler is also manifest from the fact that this formed one of the most important subjects to come under the notice of the recent International Congress of Architects. There was a force identified very closely with the public which might form a valuable ally in the cultivation of greater interest in what is good in architecture, namely, the Press, the most democratic of all forces. If, according to Bishop Creighton, architecture is the most democratic of all the arts, there is a want of harmony somewhere, for generally speaking the home architect does not owe much to the members of the fourth estate. Of course, the professional Press, the lecturer maintained, had its own sphere of undoubted usefulness, but was practically limited to the profession, the public being only interested in the illustrations. Surely a little of that interest which the Press lavishes on sculptors, musicians and painters might be bestowed upon the efforts of the architect. The President was hopeful of the future, which would bring with it more of that recognition and appreciation of architecture which is undoubtedly its due. His closing remarks referred to the projected amalgamation of the Association with the Glasgow Institute of Architects, and to the good that was likely to ensue. A vote of thanks was awarded Mr. Lochhead for his address.

GENERAL.

Friedrich Bensch, the German sculptor, has died at Girgenti, in Sicily, in his sixty-third year. His works are to be seen in Berlin, Münster, &c. One of the best known is the *Steam*, in the Technical School of Charlottenburg.

Sir A. B. W. Kennedy will deliver an address at the opening meeting of the session of the Institution of Civil Engineers on Tuesday, when the medals and prizes will be presented.

Professor Gourlay will deliver a lecture on the Byzantine churches of Constantinople this (Friday) evening to the members of the Architectural Craftsmen's Society, Glasgow.

Mr. Banister Fletcher will give an introductory lecture on "Greek Architecture" at the University of London, South Kensington, on Monday, November 5, at 8 P.M.

Mr. Percy L. Marks is about to publish through Messrs. Swan, Sonnenschein a volume entitled "The Principles of Architectural Design." The part relating to exterior design has appeared in *The Architect*, but in the pages interior design will likewise be treated. The illustrations will be derived from actual works. The subscription price is 7s. 6d.; after publication it will be raised to 10s. 6d. The list of subscribers is influential and satisfactory.

The Aston Town Council on Tuesday discussed a proposal by the public works committee to increase the salaries of the surveyor's three assistants instead of appointing a successor to the architectural assistant, allocating his work amongst the members of the present staff. This would involve a saving of 74l. per annum. Mr. J. E. Berry protested against the recommendation, and characterised it as false economy. It was unjust to put more work on the shoulders of men who were already fully employed. For a considerable time the members of the department had been working at high pressure, and it was wrong for the Council to "speed-up" their servants, and all for a paltry saving of 74l. per annum. The recommendation was adopted, Mr. Berry being the only dissident.

Mr. H. Percy Adams has been awarded the gold medal for his architectural works by the jury at the Milan International Exhibition.

A Collection of "Manchester Sketches," by Mr. Frank L. Emanuel, has been issued from the offices of the *Manchester Guardian*. Cottonopolis has a character of its own, which Mr. Emanuel has not only studied, but realised in black and white with surprising success. He is Rembrandtish in his effects, and the collection of plates deserves to be welcomed not only by citizens, but by all who can admire vigorous and original draughtsmanship.

The November Number of *Concrete and Constructional Engineering* contains the rules concerning reinforced concrete which are about to be issued by the French Ministry of Public Works. The explanatory circular accompanying the rules explains the theory of concrete beams as it appears to the French official mind.

At a Meeting of the Society of Engineers on Monday next at the Royal United Service Institution, Whitehall, a paper on "Recent Storage Battery Improvements" will be read by Mr. S. Cowper-Coles.

At the last Meeting of the Dundee Technical Institute committee it was announced that the subscriptions for the new Institute scheme totalled 22,500l. This was the sum aimed at, and in the hope that an equal sum would be obtained from the suspense account earmarked to the Scottish Education Department, a site for the new building had been purchased. The negotiations were considered satisfactory, and it was agreed to take steps to obtain an architect.

The Durham Education Committee have declared the following awards regarding the competitive plans submitted for new schools:—Greenside—John Morson, architect and surveyor, Westgate Road, Newcastle, and Durham. Consett—1, W. H. Knowles, architect, Collingwood Street, Newcastle; 2, James Garry, Church Street, West Hartlepool; 3, Messrs. Clark & Moscrop, Feethams, Darlington.

Mr. Harcourt, M.P., gave last week the following official explanation in the House of Commons of the refusal by the Government of the Stibbert bequest. It was, he said, declined in August last because it appeared to His Majesty's Government, on examination of the will, that they would have practically no power over the administration under the conditions laid down by the testator, and would be involved in rather wide financial liabilities. Neither under the terms of the bequest nor under the Italian law could any part of the collection have been transferred to this country. The renunciation of the bequest by us transfers it on exactly the same terms and conditions to the commune of Florence, and therefore those desiring to see the collection will do so exactly as if we had been in nominal custody of it.

The Preston Free Library Committee, in order to familiarise children with work that is artistically good and to teach them the history of their country, are distributing framed pictures to the elementary schools of the town. The pictures are by the best artists, dead and living, who have dealt with the legends, the poetry and the history of this country and the great events of the world. In addition, the committee have obtained a series of large coloured photographs of places noted for their historical associations or for their beauty.

Mr. A. G. Smith, the American Consul at Victoria, British Columbia, in a report says that engineers and other deeply interested parties are planning not only new railroads in British Columbia, but are projecting schemes to connect the island of Vancouver with the mainland. The people of Victoria and Vancouver Island desire the extension of the island railroad to Cape Scott, the extreme north of the island, and the bridging of Seymour Narrows by a Government railroad toll bridge. Plans have been prepared for the construction of such a bridge. The scheme proposes a series of bridges from island to island. The longest span from Valdez Island to rock would be nearly 1,000 feet in length, but as the Quebec bridge across the St. Lawrence has a span of 1,840 feet, the one contemplated here could be erected without danger, once the pier is built on rock in the centre of the Narrows. Competent engineers say this is entirely feasible. It is estimated that the cost of this bridge or series of bridges would be from 2,800,000l. to 3,600,000l., to be paid for by Dominion funds.

The Architect.

THE WEEK.

THE gift of 300,000*l.* by Mr. CARNEGIE for the erection of a Palace of Peace at The Hague would deserve to be called princely, only that history demonstrates that princes in all ages were not favourable to peace when they were able to profit by war. The competition was international, and no doubt inspired the London County Council to give architects everywhere a chance of designing the new county hall. The Council, it must be owned, were supported by the resolution of the late Congress of Architects, at which international competitions were recommended, and there is not much use in a congress passing resolutions without opposition if they are not accepted as final and binding. It would be fortunate for English architects if that were the only example of imprudence on the part of those who profess to be the official representatives of the art. Whether foreigners take part in the London competition or not, it is to be devoutly wished that the result will be more satisfactory than that of The Hague competition. The numerous judges who were appointed have reason to be ashamed of their mode of acting. They knew the extent of the funds likely to be available, and yet a design was selected which any builder must have seen would cost far more than the sum indicated. Mr. CARNEGIE has acted loyally and has not withdrawn his offer, although from the fiasco there is a probability that his money will be wasted on a "folly" instead of a palace. But he has wisely declined all appeals to increase his 300,000*l.*, and his resolution will probably lead to another competition. All that is at present gained by the contest is a demonstration that in architectural affairs there is not safety in a multitude of counsellors. A number of Dutch women would have served equally well as judges.

An effort was made on Monday at a meeting of the Maidstone education committee to appoint an architect for a school about to be erected. A sub-committee recommended:—"That the ground plan of the proposed new school as prepared by the borough surveyor be approved, and that he be further instructed to proceed at once with the work of preparing plans which shall give full details." Mr. BROWNSCOMBE proposed that a competent firm of architects should be invited to prepare the detailed plans, as the borough surveyor had already a sufficient number of buildings to engage his attention. As the school was supposed to cost only 8,000*l.* the architect's fees at 4 per cent. would amount to 320*l.*, and an equivalent sum was likely to be saved. Another councillor said they were now saving 2,000*l.* a year on architects' fees and probably 1*l.* a head on children to be accommodated. The committee were very nearly divided on the subject, for Mr. BROWNSCOMBE'S amendment was lost by only one vote. Evidently the majority do not set any value on the advantage which can be derived from having satisfactory buildings erected in the town. The school was to be a plain structure, and it is not difficult to imagine what that means.

THE decisive action of Mr. HUGH BLAKER, the curator of the Holburne Museum in Bath, might well be imitated in some other picture galleries. On the walls were about 250 works presented by the late Sir WILLIAM HOLBURN, and which he had catalogued. In consequence of Mr. BLAKER'S action about 200 have been eliminated. It is needless to say that among those which have gone into limbo the majority were supposed to be masterpieces of the great artists. There was an *Arctino* by TITIAN, a portrait of CHARLES I. by VANDYKE, a portrait by RUBENS of his wife and child, a

portrait of GERARD DOUW by himself, a *Nell Gwynne* by LELY, a *John Milton* by WALKER. In fact, Sir WILLIAM believed that he was the fortunate possessor of a noble collection, and that he was really endowing Bath when he made over the pictures to that city. The decision to strip the gallery cannot cause much excitement in Bath, for few visitors cross the threshold. At present, however, the collection should possess a more genuine interest, for out of the fifty pictures which have survived the scrutiny there are twenty-two by the BARKERS, whose names are connected with Bath. THOMAS BARKER'S *Woodman* was made the subject of many engravings, and BENJAMIN BARKER'S landscapes deserve admiration. There is also a fine portrait by HOPPNER, who was a rival of Sir THOMAS LAWRENCE, and one or two examples by GAINSBOROUGH.

THE Disused Burial Grounds Act of 1884 enacts that "it shall not be lawful to erect any building upon any disused burial-ground, except for the purposes of enlarging a church, chapel, meeting-house or other place of worship." The clause will alter the condition affecting a new parish church at Epsom. It was proposed to erect a church by instalments in the churchyard. But as that course cannot be adopted, the new building will have to be erected in two sections around the existing fabric in order that it may be considered as an enlargement in the legal sense. There will be a difficulty in dealing with the tower. It is desired to preserve it, but, if so, it will be necessary to erect another tower. The new work will commence at the east end, and the first part is estimated to cost about 7,500*l.* The amount already promised is 6,700*l.* It is strange that a design should have been prepared, subscriptions sought, and the working plans and specifications ordered without any attention having been given to the Disused Burial Grounds Act, which has been in operation for the past twenty years.

THE Ripon City Council appear to be desirous of acting worthily by arranging for a water supply for the protection of the cathedral against fire. A supply of water is at present available, but it is proposed to have a connection with the mains at St. Agnes's Gate and St. Mary's Gate, which would allow an increase of pressure and a large supply. Although the church was not raised to the rank of a cathedral until modern times, *i.e.* 1836, yet its history goes back to the seventh century. The building was erected by St. WILFRID and was one of the earliest constructed of masonry. The west front, central tower and part of the choir and aisles of the existing building are supposed to date from the time of STEPHEN, the worthy king. The great window is thought to be late fourteenth-century work. The cathedral was restored by Sir GILBERT SCOTT, and is too important to allow of any neglect of protection because it might be feared that the water supply would not be fully paid for by the Dean and Chapter.

THE theft of a statue of Isis from the Louvre must incite the authorities not only of that great museum but of those in other cities to adopt more precautionary methods to insure the safety of the collections. Egyptian sculpture is usually heavy, and it is surprising how a statue could be removed and probably carried through the streets of Paris without attracting some attention from the police. The Egyptian section is generally visited only by those who have a particular interest in the objects and who would be indifferent to what took place in other parts of the great hall. The loss may be only temporary, but it is an indication that in Paris there is less respect for national property than formerly. Both the Louvre and the Luxembourg are insufficiently guarded. But there was confidence that all the visitors would be protectors of whatever was exhibited. Henceforth it will be necessary to expend more money in guarding the different galleries, and especially those where there are portable objects.

PARTY WALLS.

IT would be interesting to discover when the peculiar rights connected with party walls were first claimed and allowed. Man is selfish by nature, and we cannot suppose that in an early age he was likely to grant any convenience to a neighbour unless he received compensation or was made accommodating under compulsion. Some speculators have indeed held that early man preferred the solitary state and that he wished to have a cave or tent as his own possession. The advance of civilisation would therefore in some measure be connected with party walls, for we must suppose from their existence that men were not only able to erect houses, but they were willing to live in streets of houses which were joined together rather than detached. It is concluded that the Greeks recognised party walls because the word *mesotoichos* was used by them. If the houses were of the frail kind which is inferred from the few descriptions of them, we cannot suppose that much extra support could be given by any of the external walls.

The Romans, on the contrary, not only built substantially, but they took care to define the law of building. For instance, CICERO mentions as a stock argument in the Courts the following one on the subject of a party wall:—

All men have a right to add to a common party wall a wall extending its whole length, either solid or on arches, but if anyone in demolishing the common wall should promise to pay for any damages which may arise from his action he will not be bound to pay for any damage sustained or caused by such arches; for the damage has been done not by the party which demolished the common wall, but in consequence of some fault in the work, which was built in such a manner as to be unable to support itself.

The passage, apart from its legal importance, has interest as throwing a light on construction. It is not improbable that the masons and bricklayers of Rome were of Etruscan descent, and had an almost superstitious belief in the properties of the arch. They would use it, therefore, as a means of providing against future loads on a wall as well as for the attractive appearance of a series of arches. But if by any chance the part of a wall which served as an abutment to the arcade was to be broken into or weakened in any way, it is quite possible that some of the arches would lose their cohesion. We may therefore conclude that while the *paries solidus* or plain party wall of stone or brick was favoured by the common law of Rome, the *paries fornicatus* was looked on as being more ornamental than useful, for although more expensive it was not stronger than an ordinary blind wall. Another instance is mentioned by CICERO:—"In the case of someone building a roof for the purpose of covering a common wall, PUBLIUS SCÆVOLA asserted that there was no right of carrying that roof so far that the water which ran off it should run on to any part of any building which did not belong to the owner of the roof." This is an obscure decision. But we may, at least, infer from it that great care had to be taken in Rome to preserve party walls from damp. The French get over the difficulty by having in the top of the party wall a "chaperon" or capping, which is inclined on both sides to allow the water to escape in an equal measure on each property.

It is possible that the Roman law was not without effect on what was known as the "custom of Paris" in respect of party walls. If anyone wished to build against the wall of another man's house he had not only to avoid any injury to it, but he had to purchase a right to share in the support afforded by the wall. It might be supposed that one-half the wall would be required. But some authorities in the seventeenth century considered that not more than 18 inches had to be paid for, although the wall might be more than 36 inches in thickness. In modern times the price to be paid in France is determined not by the actual cost of the wall

but by its present value, and in reckoning the value the depth of the foundations has to be taken into account.

This rule about purchasing was recognised in the rebuilding of London after the Great Fire. It might be expected that when such an immense area had to be covered arrangements would be made for the disposal of the sites in the different streets according to some approved plan. But apparently individuals were allowed as much liberty as they would have had before the catastrophe. By the Act which was passed in the year following the Fire, it was enacted that the Corporation of London were to appoint one or more discreet persons, intelligent in the art of building, to be surveyors, to see that the scantlings or dimensions prescribed were well observed. It was decreed that the exteriors of buildings should be of brick or stone, or brick and stone together. Party walls therefore became necessary, and the following general order was given respecting them:—

The surveyors shall take care, party walls and party piers to set out equally on each builder's ground to be built up by the first beginning of the building and toothing left in the front wall, and that no man be permitted to build on the said party wall until he hath reimbursed the first builder the full moiety of the charges of the said party wall and piers, with interest at six per cent. for forbearance; and in case of difference the alderman of the next ward to mediate an agreement, and where he cannot do it, to appeal to the Lord Mayor and Court of Aldermen to hear and determine the same.

In by-streets or lanes the houses were to be two storeys high, besides cellars and garrets. The party walls were to be $1\frac{1}{2}$ brick thick up to the garrets, and in the garrets 1 brick at least. Buildings of the second class were to have three storeys besides cellars. The buildings in the principal streets were to have four storeys, besides cellars and garrets. The party walls up to the first storey were to be 2 bricks thick and then $1\frac{1}{2}$. It was also announced that:—"Where any difference arises between several owners concerning party walls, the same shall be referred to the City surveyors to decide the difference, if they can, who may order, exchange or divide their ground, or award satisfaction in money; but if the parties refuse to submit to such order, then the Mayor and Court of Aldermen to determine the same without appeal." The surveyors were to see that the party walls were set out equally.

The directions relating to the rebuilding of the City of London in the seventeenth century, it will be seen, were much more simple than those to be found in the London Building Act. An endeavour has been made to prevent mistakes by making party and external walls have the same thickness. But it is an advantage to have as precise directions as possible on so important a subject. In the United States there is much diversity of opinion among authorities about it. In some States the by-laws require that the party walls shall be of the same thickness as external walls, or, in other words, they correspond with the practice in London. There are certain towns where the party walls have to be 4 inches thicker than the external walls, while in others the party walls can be 4 inches thinner. Theory is in favour of giving greater thickness to the party walls as they have extra duties to perform.

A treatise on party walls and the rights and liabilities of adjoining owners, by Mr. A. R. RUDALL, of the Middle Temple (London: JORDAN & SONS, LTD.), is of much interest, for common law affects party walls except in London and places regulated by local Acts. In looking over the pages it is surprising that still more actions do not arise in relation to party walls, for a disagreeable neighbour can find scope through them for giving annoyance and causing money to be wasted. Indeed, from some of the judgments it might be doubted what is the extent of the rights which each party can possess in a party wall. The centre of a wall is not necessarily the boundary between two properties. If by some over

sight a man builds a wall on another man's land he ceases to have any property in it and the wall becomes a gift to the owner of the site. All architects who may have to deal with buildings in country towns and villages will find many warnings in the pages which will be useful to them. The author also treats of party walls under the London Building Act. The number of cases referred to will show that in spite of all the precautions taken in preparing the Act and the unusual scrutiny in committee-rooms, opportunities are left which litigious persons can turn to account.

BATHS AND WASHHOUSES.*

A TERRIBLE indictment against the mass of the English people was expressed when they were described as "the great unwashed." But if we remember that it was not until 1824 that a few benevolent individuals tried the experiment of opening a bath for the poor in London there seems to be some excuse for the allegation. Cleanliness was impossible (outside a Russian house) without the use of water, and in the first half of the nineteenth century water was a scarce commodity in the towns of Great Britain. The wise Dr. JOHNSON advised a friend to be content with a dirty skin rather than attempt a bath, and confessed that he hated immersion. However proud we may now be of the tub, it was not a national necessity until a comparatively modern period. Mr. BOWIE, the surgeon, must have been considered as a visionary when he projected public baths which could be upheld without loss. As the first experiment in Whitechapel cost 26,000*l.* there was ground for the suspicion. The novel building not only rendered public service, but various foreign Governments obtained copies of the plans in order to set up similar establishments.

The large volume by Mr. A. W. S. CROSS shows the progress which has been attained in the course of half a century. We are far from adopting the magnificence which was apparent in the great Roman baths, but by the aid of machinery the services have attained a perfection which probably would have amazed a Roman patrician. As a rule, baths for immersion and swimming baths are preferred. Though no air and vapour baths are to be found in many of the later buildings, it may be assumed that in course of time such additions will be more general. The world has not yet realised BACON's idea of "fair and large baths of several mixtures for the cure of diseases and the restoring of man's body from arefaction, and others for the confirming of it in strength of sinews, vital parts and the very juice and substance of the body."

Examples are given of baths designed by the author, Messrs. WILLS & ANDERSON, E. HARDING PAYNE, KAYE PARRY & ROSS, T. W. A. HAYWARD, SPALDING & CROSS and H. T. HARE, W. G. WILSON, A. R. JEMMETT and A. S. TAYLOR, R. STEPHEN AYLING, MAURICE B. ADAMS, H. DIGHTON PEARSON. These will suggest different ways of dealing with a very important problem. Much depends on cost, and on that subject Mr. CROSS writes:—

It is extremely difficult to compile thoroughly reliable data of the probable cost of public baths and washhouses, or, indeed, of any other buildings. For instance, one site may require foundations of a far more costly nature than another, or, owing to their location, the incidental expenses for the carriage of materials or for the cartage of excavated earth are alone sufficient to cause considerable variations in the cost of structures which at first sight appear to be capable of being erected at about an equal rate per cubic foot. Then, too, the great divergence in the quality of the materials used in the construction of some of the more recently erected public bath establishments, causes their average cost per foot to become an unreliable factor in the preparation of an approximate estimate for buildings of a

more or less similar character. As instances, in some establishments there are porcelain enamelled fireclay ware slipper baths costing 10*l.* each, whilst in others cheap iron baths are fitted. The dressing-boxes and bath compartments are sometimes constructed of deal, sometimes of teak, sometimes of slate, sometimes of marble. The slipper-bath valves also vary in cost from 3*l.* to 6*l.* or 7*l.* a set. The bath platforms may be paved either with inexpensive granolithic paving or with costly interlocking rubbed tiling; the enamelled bricks may be either of the best or of "seconds" quality, or there may be no enamelled bricks used, and so on throughout all the portions of the building. With the engineering plant there is the same difficulty. It is a desirable and wise provision to install an extra boiler as an auxiliary in case of a breakdown in one of those required for the heating arrangements, and in some public baths the boiler plant provided is thus in excess of their actual everyday requirements, whilst others contain only the minimum requisite amount of steam-generating power. Fuel economisers which add considerably to the initial cost of the engineering plant, but are of the greatest possible assistance in decreasing the subsequent working expenses of the establishment are sometimes provided, but more often, in order to reduce the first cost of the boiler installation, they are not included in the plant laid down by the bath authorities.

A similar argument could be used with other varieties of buildings, yet averages are made out and are found to be useful. It is not compulsory on local authorities to erect baths, and opposition to proposals is usually based on apprehensions of the expense which will have to be incurred. It would have been advantageous if Mr. CROSS had supplemented the information in his book by statements of the cost and accommodation afforded in metropolitan and provincial baths. We are told that the debt on the two Shoreditch baths amounts to 125,974*l.*, and it would not be difficult for an authority to decide whether they would serve as standards. The necessity of having some idea of the cost is shown by an interesting paper by Mr. WAKELING, chairman of the baths and washhouses committee of the Shoreditch Borough Council. That body proposed to spend 30,000*l.* on baths, a competition was organised, and after much delay and trouble the plans of one competitor and the elevations of another were amalgamated. The builder's tender was for 35,000*l.*, and that sum had to be increased by 24,177*l.* owing to the employment of more durable materials. For the benefit of others in a similar position, Mr. WAKELING says they made a mistake in asking the President of the Institute of British Architects to nominate an assessor, because "he too often appoints an architect to act in that capacity who does not possess the requisite practical knowledge governing the requirements of the particular type of building upon which his advice is sought, and in our case the assessor omitted to inform us that a baths establishment of the size and finish we required could not be constructed within the limits of the cost we had named." On all such matters as administration Mr. WAKELING's paper is valuable, for he investigates subjects, as far as they come within the purview of his observation, with an attention which could not be expected from an architect.

The majority of people who use public baths prefer slipper baths. Ordinary enamelled baths, it is said, should never be employed, and preference is given to those with vitreous enamels, which Messrs. DOULTON manufacture. The Duplex bath valves of Messrs. GEORGE JENNINGS, LTD., are recommended. A description is given of the system of slipper baths which Mr. JAMES KANE, of Bristol, has patented. In the first place, the bath-room is separated from the dressing-room. The inventor prefers the spray system. By his plan the slipper or spray baths are placed in a central hall, and the dressing-rooms are arranged on the opposite side of a passage. The temperature of the bath-room is maintained at 100 deg. Fahr., and the dressing-rooms at 60 deg. Fahr. The Lassar baths are in favour in Germany and the United States. The bather stands "upon a floor grating in the warm cubicle

* *Public Baths and Washhouses.* A treatise on their planning, design, arrangement and fitting. By Alfred W. S. Cross. (London: B. T. Batsford.)

or bath-room, and after having well soaped his body with warm lather, turns on, by means of a lettered lever valve, a fine spray of warm water, which drives away all soap and impurities, and ends, by a continuation of the movement of the controlling valve, with a cool or cold spray." The Lassar baths are used at Acton, and it is said the attendance in the twelve baths is 400 weekly.

The architect would have a comparatively easy task if he had only to design buildings and to select the fittings. But the efficiency of a public bath depends mainly on the water supply, the heating, the ventilation and the lighting. On all these matters information is given by Mr. CROSS. Sometimes it may be necessary to sink a special well. The heating is described at length, and experts have furnished information on that subject and on lighting.

The Turkish bath necessarily requires greater care in designing than any ordinary bath. Mr. CROSS says the bather is not allowed to enter any of the bath-rooms while wearing either boots or shoes. But in some well-conducted baths a bather is required to put on sabots. In that way the floor is kept in a more cleanly state. Another regulation which deserves to be adopted in England is to have the walls, slabs and floor of the hot-rooms cleansed with a hose and water once an hour. Twelve to fifteen feet is suggested for the height of the rooms. The heating and ventilation present many difficulties, and it is doubtful whether a perfect Turkish bath exists in Great Britain. Vapour baths can without difficulty, where there is a large site, be combined with a Turkish bath, and the amphitheatre arrangement is probably the best. If the steam when entering is made to pass over some odorous material the bather is less oppressed.

It cannot be said that we have an excess of bathing and washing establishments in this country. Indeed, there exists a prejudice in many places against hot-air and vapour baths, as if they were likely to transform those who would use them into Russians and Turks. Their therapeutic value is, however, unquestionable. We may expect, then, that as authorities become more enlightened they will endeavour to erect public baths. As it presents excellent examples of modern baths there is certain to be a demand for Mr. CROSS's book as a guide not only for architects, but for public authorities. It is produced in admirable style, both with architectural elevations, plans and sections and illustrations of appliances.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at Tufton Street, Westminster, Mr. R. S. Balfour, president, in the chair.

The following gentlemen were elected members:—Messrs. L. Brunati, W. Reid, J. Page, A. Womersley, A. D. Robinson, H. H. Hill, C. W. Clark, L. J. Hicks, R. H. Wheeler, F. O. Marchant, A. R. Allen Lodge and L. A. Culliford.

The PRESIDENT announced that the presentation to Mr. W. G. B. Lewis would take place at the next ordinary general meeting on November 30.

The Korinthian Order.

Mr. HUGH STANNUS read a paper on the Korinthian capital. He apologised for the change of subject from the one given in the Brown Book, and explained that pressure of work had precluded the possibility of completing proper diagrams for the other subject in time for the date he had agreed to take. He had been occupied for some years in thinking about the present subject, during such leisure as a busy man has, and in preparing notes; and he proposed, firstly, to show the evolution as Mr. Schultz had similarly done on the Ionic capital fifteen years ago; and, secondly, to go critically through the various elements which may be said to constitute the Korinthian capital with some consideration about their possibilities.

Mr. Stannus commenced by admitting that the Korinthian capital was one of the small things of architecture, but often the hand of the artist is shown by his attention to such small

things. He defined the capital and explained its constructive function and its æsthetic value. In Korinthian examples the essential elements were:—The calyx, *i.e.* the leaf-band at the starting, and the major cauliculus, *i.e.* corner-scroll under the abakos at the top. Without these a capital might be Korinthianesque or semi-Korinthian, but it could not be considered as a complete or perfect example of the style.

He explained the origin of the name, it having been adopted because the ornamental parts of the early capitals were made of bronze from the ancient city of Korinthos, repeating the remarks on this subject which he had made in a discussion following a paper by Mr. Lethaby at the Society of Arts on February 11, 1890. He showed views of Roman remains in which the capital was bare, the ornamental leaves having been removed; and directed attention to the holes of the rivets with which they had been originally fixed, and said that this example, though late, was evidence of the practice.

He traced the evolution, from the Egyptian papyrus-flower capitals, to a (theoretical) early example of the Aiolou type. Then explaining his reasons for believing that the capital which is figured in Professor Cockerell's book on Bassai was not a portion of the architecture of the temple, but only the capital of a statue pedestal, he suggested the date of it as about 380 B.C., judging by the details shown in Cockerell's drawing. He demonstrated the gradual building-up of this capital with bronze scrolls and leafage ornaments, thus proving that it is the simplest and therefore the earliest example of which there was any pictorial record; and further that it was undoubtedly derived from a bronze original. The date of the succeeding type, from Epidauros, he accepted as 374 B.C.; and from internal evidence he showed that it was later than the Bassai type, though containing equally strong evidence of a bronze original, and also traces of Ionian influence. The Miletos type, he placed at about 360 B.C., and he explained the design. He then mentioned the Choragic column type, which shows traces of Phœnician influence; and further he proceeded to explain and criticise the Lusikrates type, of 335 B.C. There must have been intermediate steps between this date and the time of Antiochos IV., but he did not know of any existing examples. The Olumpeion type of 174 B.C. shows a severe and orderly arrangement of the leaves; and it was probably from some of these capitals, which were a part of the loot taken by Sulla to Roma, that the Romans derived their normal type as seen at Mars Ultor and in the Pantheon. The Tivoli type, he considered, for historic reasons to be about 75 B.C.; and showing slides of several examples, he suggested that some of them were intentionally archaisic, and that there has not been any further development from that type; the Classic and Renaissance architects basing their further variations on the canonical Mars-ultor type.

Mr. Stannus then proceeded to enunciate the principles which govern the design. Firstly, he showed from nature the radiation in growth, the gradation in richness, the alternation in position, the redundancy in foliage, the variety in leaf edge and the economy in effort; and secondly, he applied these to the capital. He concluded by pointing out the moral of it all was that the canon is not closed, and he indicated various directions in which a healthy evolution might travel. There were yet great possibilities for the Korinthian capital. He had led them up to the Promised Land, and he hoped they would enter in and possess it, and he finally referred students to Mr. Spiers's book on Grecian and Roman, and to Mr. Statham's little book, which he characterised as a thoughtful book for thoughtful people.

The paper was fully illustrated with diagrams and lantern slides.

Mr. R. PHENÉ SPIERS, who proposed a vote of thanks to Mr. Stannus for his paper, in referring to the introductory remarks of the author, said it would seem that the climate of Egypt had a different effect upon Mr. Stannus than it had upon himself. He was bound to say that as regarded the origin of the various sources from which Classical architecture developed there was no borrowing from the Egyptians. The Greeks took nothing. In the explanation of the Aiolou type of capital the conclusions were theoretical. The author had also pointed out that the very essence of the Korinthian capital was the spiral which, starting from the bell, rose to support the abacus. But, said the speaker, there was no abacus in Egyptian architecture and, in fact, the Egyptians never realised the important value which an abacus could have. The speaker supposed that if the Greeks had copied from Egyptian examples they would have done what the Egyptians did, but there was no trace in Classical work of the series of lines which represented the

stems and stamens of flowers. Those details were not found in any Greek capital of any description and in any time. The speaker differed with the author in several of the dates given to some of the examples.

Dr. CLAY seconded the motion and said he was very much interested in the description of the way in which the bronze capital had originated. He did not know whether the theory was entirely made up or whether there was a foundation of fact to support it.

Mr. H. DAVIES said he would have liked to have heard one or two points at greater length. No reference had been made in the paper to the colour treatment of the Greeks. He thought that if they studied the detail, the further they searched new ideas would be revealed of the difference in colour treatment.

The PRESIDENT, in putting the vote of thanks to the meeting, said they would all agree the lecture had been a most interesting one.

GLASGOW ARCHÆOLOGICAL SOCIETY.

OF the company of gentlemen who met fifty years ago on a winter's afternoon in the directors' room of the Merchants' House, Hutcheson Street, with the view of forming an archæological society in Glasgow only one, says the *Glasgow Herald*, it is believed now survives. Mr. John Honeyman, LL.D., who is now an ex-president of the Society, and crowned with many other honours, was then described as "Mr. Honeyman, jun., interim secretary," and probably, therefore, it was largely due to his then youthful zeal that the meeting was convened. The Lord Provost, Sir Andrew Orr, took the chair, and referred in a somewhat doubting spirit to some former occasion when "many enlightened gentlemen met for a like purpose." The gentlemen had scarcely been enlightened enough, one gathers, to be very practical, and nothing up to 1856 had come of their pious aspirations. On this occasion, however, a code of rules—which are very much the present rules—was proposed by Mr. John Baird, architect, who stated, in answer to a question by the Lord Provost, that at least fifty members might be counted on. The future Sir Michael Connal then proposed the election of office-bearers, to wit, the Lord Provost as president, Messrs. John Strang, LL.D., and William Euing as vice-presidents, and a council consisting of Messrs. John Buchanan, Gabriel Neil, Laurence Hill, John Baird, J. T. Rothead, William Keddle and John Honeyman, jun. Mr. J. B. Simpson was to be hon. secretary, but as a matter of fact Mr. Honeyman took up the duties, and Mr. William Church, jun., was hon. treasurer. Then Mr. Rothead made a speech as to the very favourable field which Glasgow and its neighbourhood presented. "When they looked at the magnificent old remains, at the Roman wall, at the Roman forts at Kirkintilloch, it was with regret that they knew they were not in possession of all particulars regarding them. He said that there was an old house in Great Clyde Street, belonging at one time to a family called Dreghorn, the ceilings of which were all covered with hand-wrought plasterwork and not with stucco. Mr. John Carmichael hoped that each party present would endeavour to give the proposal as much publicity as possible. Mr. David Dreghorn remarked that a very great use might be made of photography." Then a vote of thanks was proposed to the Lord Provost, and the antiquaries went home, having laid an excellent foundation for the work that was to come. A full report appears in the *Glasgow Herald* of December 8, 1856. It is pleasant to read that at the third meeting of the Council of the new Society, when the membership had already grown to sixty-five, there was present Mr. J. Mitchell Mitchell, "one of the secretaries to the Society of Antiquaries, who expressed his pleasure in seeing such a Society formed in Glasgow, and assured the Council of the interest and co-operation of the respected body which he represented." The pleasant relations of the antiquaries of Glasgow and Edinburgh have continued to the present day; whatever jealousies there may be otherwise (if there are jealousies, which is not admitted), there have been none at any time between the Society of Antiquaries of Scotland and the Glasgow Archæological Society.

For over twenty years Glasgow had every reason to be proud of its antiquaries; they met often; they read careful and elaborate papers, and they published useful transactions in parts of a convenient size. As was to be expected the leading citizens of the day were all members, and at the

request of the Lord Provost the Court-house Commissioners authorised him to give the Society the use of one of the unoccupied safes in the Wilson Street building, and the proprietors of the *Herald*, through Mr. Pagan, intimated that they were willing to print the transactions without profit, "merely charging the Society the price of the paper and the wages of the workmen." Alas! those noble days have departed; the Society has no safe in the Court-house, and its bill for printing transactions is no trifle. Perhaps the authors of half a century ago were modest in their Press corrections. After some years of service Mr. James Smith, of Jordanhill, succeeded Sir Andrew Orr as president, and Mr. William H. Hill, and afterwards Mr. Cunningham Monteath, filled the office of secretary. Then when Mr. Smith was dead, and Dr. Hill had resigned, there was a time, such a time as comes to all societies, learned or social, when the best members were not so energetic as they had been and the almond tree flourished. It was even proposed in 1873 that the Society should cease to be a separate body and become a section of the Philosophical Society, but a general meeting of the members seems to have extinguished the proposal and a committee was appointed with the very proper purpose of communicating with the trustees of the City Improvement Act "with a view to secure the preservation of such sculptured stones and other relics in the ancient buildings now about to be removed as may be in danger of destruction." Mr. Euing was president for some years, and was succeeded by Dr. John Buchanan. In September 1877 Mr. Cunningham Monteath died, and on October 4 Mr. Alexander Galloway, a well-known antiquary, agreed to act as interim secretary. He set to work with great vigour, prepared a report from the foundation of the Society on the membership, the number of papers, the subscriptions and disbursements, and outlined a scheme for the development of future work. Mr. Galloway's enthusiasm was contagious. Principal Caird accepted the presidency in 1878, and Professor (now Principal) Lindsay, Mr. Galloway and Mr. Dalrymple Duncan became hon. secretaries. At once the Society entered on a new lease of vigorous life. Since 1878 there has been no hesitation in its progress, and its usefulness has multiplied. The presidential chair has been filled by an extraordinary series of able men, whose names are household words to all who know Glasgow of the last quarter of a century. Professor John Young, the most versatile of scholars, succeeded Principal Caird, and was always ready from the inexhaustible stores of the Hunterian Museum to furnish instruction and entertainment; to him succeeded Professor John Veitch, equally eminent in other ways, who set a high example to all presidents in that for three years he rarely failed to fill the chair at each meeting; then came Principal Lindsay, and after him in succession Dr. Honeyman and Professor John Ferguson. For one brief year the lamented Colin Dunlop Donald presided over the Society, whose membership he had enormously increased by his energetic and contagious enthusiasm in all matters relating to old Glasgow. He was succeeded by David Murray, whose successor was the venerable Archbishop Eyre, a man who took singular delight in the opportunities which the meetings of the Council and of the Society afforded him of becoming personally acquainted with Glasgow men who, like himself, were lovers of the beautiful and ancient in art and literature. Principal Story followed the Archbishop, and had as successor Dr. John Oswald Mitchell, whose presidential address, written on his sickbed, will long be remembered by those who heard it. The present president is Mr. J. D. G. Dalrymple, who has intimated his intention of commemorating the jubilee of the Society, which owes so much of its success to his energy during his secretaryship, by providing funds for an annual series of lectures on archæological subjects, somewhat analogous to the well-known Rhind lectureship in Edinburgh; the lecturer is to be appointed by the Council of the Glasgow Archæological Society, and it is proposed that the lectures should be delivered in the University—a proposal to which Principal Story has given a cordial welcome.

The Society altered the form of its transactions some years ago; they form a series which is indispensable to all students of Glasgow, its men and manners, its streets and families. In addition to its transactions, however, the Society some years ago published a very complete and authoritative report on the Antonine Wall, the text of which was written by Dr. George Neilson, and the Society was under obligations to Mr. P. M'G. Chalmers for drawings illustrative of the report. The Society is also more or less

directly responsible for the formation of the Regality Club, and looks with sisterly eyes on the vigorous young Old Glasgow Club, so that its activities have been far-reaching. Again and again it has taken a vigorous stand in defending the preservation of the very few Glasgow antiquities which remain. But for its emphatic action on one occasion there is only too much reason to fear the Tron steeple would long ago have gone, and the removal of that excellent specimen of a Scottish mansion-house, Kelvingrove House, to suit the mere temporary convenience of an exhibition refreshment committee, was an act which the Society did its utmost to prevent. To the formation of the collections in the Bishop's Castle in the first exhibition, and to the archaeological section in its successor, the members lent strenuous and valuable aid, and to the success of the Old Glasgow Exhibition equally useful help was given.

No account of the Society can be written which fails to take account of the annual excursions. Not content with six winter meetings which have been addressed at one time or other by most of the leading archaeologists of the day, the Society each year in summer has gone east or west or north or south to visit places of archaeological interest; Culross and Linlithgow, Dumfries and Birnam, Borthwick and Glamis are only a few out of the many places which have been seen by members under the most favourable circumstances, thanks to the courtesy of proprietors and local authorities on their part, who, it may be added, are not seldom benefited by the stimulus given to the local preservation of archaeological remains by the visits of such societies. Additional interest is given to the year of jubilee of what may not unjustifiably be regarded as a hard-working and meritorious Society by the quatercentenary of George Buchanan's birth being celebrated in the same year, and in the banquet of this week both events will be commemorated on one happy occasion.

TEMPLE OF DIANA, EPHEBUS.

AT a meeting of the British Academy last week a paper was read by Mr. D. G. Hogarth on "Artemis Ephesia." The lecturer related the results of his excavations on the site of the great Temple of Artemis at Ephesus in 1904 and 1905, undertaken at the request of the authorities of the British Museum. In the first place a complete ground plan was obtained of the temple of the sixth century B.C., which had been discovered below the Hellenistic stratum by Wood in 1870, with much fresh evidence of its architectural character and many small objects dedicated in that temple, among which were several cult-figurines of the goddess. Secondly, the excavation revealed remains of three distinct temples of the period before Cræsus which had not been found by Wood. These were all of much smaller area than the sixth century and Hellenistic temples, and the most primitive appeared to be a naos just large enough to contain a statue with an altar facing it, the whole enclosed in an open temenos. The foundation for this shrine lies at the intersection of the axes of all the successive temples alike, and it is evident that at all periods it was the central Holy of Holies, where stood the cultus-statue. When this central structure came to be examined it was found to be a platform made solid with a filling of flat slabs, between and among which had been packed a quantity of small objects in gold, electrum, silver, bronze, ivory, amber and other materials, including certain very early electrum coins. The whole number of objects was nearly 1,000; and from their position and the fact that they are almost all objects of personal adornment and evidently selected, they can only be supposed to have been placed intentionally where found for the use of the goddess, whose statue stood above, and at the epoch of the first foundation of her small shrine. They appear to belong to the latter part of the eighth and to the earlier part of the seventh centuries B.C. Outside this naos foundation and in the lowest stratum all over the area of the earlier temenos other objects of similar period were also found to the number of about 2,000. These include fine statuettes and other objects in ivory, crystal and metals, &c., and many more coins, but little or no personal jewellery. This unique treasure includes many representations of the goddess and her attributes, and many objects used in her cult. But attention was given especially to the first category, which was considered in connection also with the cult-figurines found in the "Cræsus" temple. These representations, nearly fifty in all, show how the goddess was locally personified over a period ranging from the eighth to the

fourth century B.C. There are several varieties of type, but it is noteworthy that in no case is there any approximation to the "multimammia" figure rendered familiar by statuettes of the Roman period and supposed to be preserved also by a well-known type of cultus-image portrayed on Ephesian and other Asiatic city coins from the second century B.C. to the third century A.D. This latter type, however, is probably not "multimammia" at all, and there is some reason to doubt if it really represents any Ephesian statue. It seems possible that it is a traditional cultus-type, not local, but probably of Phrygian or Cappadocian origin introduced into Ephesus and showing degraded survivals of features of the winged goddess type. The local Ionian personification, so far as the available evidence goes, seems to have been originally of genuine Hellenic character, a natural matronly figure. The confusion of Artemis Ephesia with the great West Asian goddess of the non-Hellenic peoples is argued to have happened late in time and to have been symptomatic of a change in the character of Ephesian civilisation, which gradually became more Asiatic, and adopted a conception of the goddess-cult reflected in the early history of Ephesian Christianity, and still to be discerned locally at the present day.

RHIND LECTURES.

THE fourth of the Rhind Lectures in Archæology by the Rev. Dr. Sayce described the connection between Babylonian and Egyptian civilisation. The two earliest civilisations with which we are acquainted were, he said, those of Babylonia and Egypt. Was there a connection between them? They both grew up on the banks of great rivers, and rested on a similar system of irrigation engineering. Could the system have arisen independently in the two countries? On the one hand, there is the fact that between the hieroglyphs of Egypt and the pictographs from which the cuneiform characters were derived there is identity or similarity in a comparatively small number of instances; even the symbols for "god" are different. On the other hand is the important fact that Egyptian was, in its essentials, a Semitic language, standing in the relation of a sister to the parent of the other Semitic languages, and therefore of Asiatic extraction. Egyptian tradition described the "dynastic" Egyptians as entering the Nile Valley from the south and conquering the neolithic aborigines by means of their metal weapons; the tradition has been shown to be correct by recent excavations, the prehistoric population of Egypt being unacquainted either with the use of metals or with the art of writing. A characteristic feature of the dynastic Egyptians was the employment of the seal cylinder. This was a Babylonian invention and is by itself proof of the influence of Babylonian culture. So too is the use of clay as a writing material, as well as the employment of brick instead of stone. In Upper Egypt the natural building material was stone, as that of Babylonia was brick. Recent discoveries have shown that the dynastic Egyptians originally made use of the Babylonian system of reckoning time, and even adopted the Babylonian pictograph (the branch of a palm-tree) to denote "a year." In art the early Egyptian heraldic position of human and animal figures was also Babylonian. The lecturer pointed out a remarkable agreement between the names, figures, attributes and pictographic representations of Osiris and the god of the primitive Babylonian seaport, Eridu. Henzen has shown that certain composite animals depicted on an Egyptian monument of the age of Menes are identical with those found on an early Babylonian seal cylinder, and Professor Petrie has noticed that the cubit of the pyramid builders was borrowed from Babylonia. The early stone vases of Egypt, again, are identical in shape with those of early Babylonia, and the sacred dwarfs who, according to the Egyptians, danced before the gods, reappear on early Babylonian seals. Probably even the shaduf, for raising the water of the falling Nile, was a Babylonian invention. We may conclude therefore that there was intercourse in the prehistoric age between Egypt and Babylonia, and that civilising influences, together with the wheat and language of the Egyptians, came from the neighbourhood of the Euphrates. Civilised man made his way from the East.

The subject of the fifth lecture was "Babylonia and Palestine." A few years ago Palestine was archaeologically an unknown land. But the veil which covered its early history has now been lifted. First came the discovery of the Tel el-Amarna tablets, which showed that in the century before the Exodus Canaan was an Egyptian province, but

that its culture was wholly Babylonian, the cuneiform characters of Babylonian language being used for literary purposes. We now know from the Babylonian monuments that Canaan was once (and for a long time) a Babylonian satrapy, that in the age of Abraham Babylonia itself was ruled by a Canaanite or "Amorite" dynasty and that Babylonian law and theology were introduced into Palestine. For many centuries Canaanite culture remained Babylonian, and there were libraries and schools where the foreign script and language were taught and learned. In the age of the Tel el-Amarna tablets education was widely spread there, and was shared in by ladies and Bedouin sheikhs. The excavations of the Palestine Exploration Fund at Lachish and Gezer, and of the Austrians at Taanach, have supplemented the discovery of the Tel el-Amarna tablets. We have learnt that Palestine was once inhabited by a race which was unacquainted with the use of metals, which burnt its dead and lived in caves. Then came the "Amorites," a taller race of Semitic type, who introduced copper, buried their dead and surrounded their cities with lofty walls of stone. They erected high places formed of monoliths and sacrificed children to the gods. In course of time bronze took the place of copper among them, and may have been brought from Asia Minor along with the polychrome pottery, which was of Hittite origin. The lecturer read translations of some letters in cuneiform characters recently found at Taanach, near Megiddo, which illustrate how widely-spread education was in Canaan in the Mosaic age. He also quoted some of the Babylonian laws which throw light on certain passages in the book of Genesis, and finally referred to the curious fact that, although we know from the inscriptions that Babylonian rule in Palestine lasted for several centuries, and that the influence of the literary culture of Babylonia was profound, few traces of Babylonian influence have been found by Mr. Macalister in his excavations at Gezer. Future excavation alone can explain the archaeological puzzle. The Phœnician alphabet does not seem to have superseded the cuneiform syllabary in Palestine until the age of Samuel and David.

PICCADILLY IMPROVEMENT.

THE agreement between the Crown, the P. and R. Syndicate and the London County Council with regard to the widening of Piccadilly at the Piccadilly Hotel provides, *inter alia*, that land shall be added to the public way so as to enable the frontage at the junctions of Piccadilly with Air Street and Piccadilly Place to be rounded off instead of the frontages of the buildings in these thoroughfares meeting at right angles. In order that the hotel may be erected to the line provided in the agreement, the corners on the Piccadilly frontage of the hotel will have to be canted. Mr. R. Norman Shaw, R.A., who has prepared the design of the elevation of the building, has written pointing out that if the corners of the hotel be canted, as suggested, the dignity and proportion of the front will be seriously impaired, and that several architects whom he has consulted concur in this view. He therefore urges that the London County Council will allow the building to be erected with square angles at these corners. This will necessitate the retention for building purposes of two pieces of land of an area of about 14 square feet each, which it has been agreed to add, but which has not yet been added to the public way. The question appears to be one of architectural design, as the retention of these small pieces of land will not interfere in any way with the convenience of the public. It has been agreed that if the Council concurs in the retention of this land, the compensation payable by the Council will be proportionately reduced. The improvements committee in their report point out that Mr. Norman Shaw, who is the senior architectural Royal Academician, acted as one of the assessors in the case of the designs, prepared by selected architects, for the suggested elevations of the buildings which might be erected in Aldwych and on the crescent site between the Strand and Aldwych, and that he has also agreed to act as an assessor in connection with the designs of the new county hall. They say they feel sure that the Council will wish to endorse the opinion of so eminent an authority as Mr. Norman Shaw, when this can be done, as in the present case, without prejudice to the public interest, and therefore recommend that the proposal to erect the Piccadilly Hotel with square instead of canted angles at the junctions of Piccadilly with Air Street and Piccadilly Place be agreed to, subject to a reduction proportionate to the area of the land retained for building purposes.

SOCIETY OF ARCHITECTS.

ARRANGEMENTS have been made by Mr. B. D. Cancellor (member of Council) for members and students of the Society to visit Winchester on Friday, November 16, when, by the courtesy of the dean (the Very Rev. W. M. Furneaux), facilities will be afforded for inspecting the structural repairs being done in connection with the faulty foundations and other defects which have been discovered and are being remedied under the supervision of Mr. T. G. Jackson, R.A., and the surveyor to the dean and chapter, Mr. J. B. Colson, F.R.I.B.A. The details of the work are of an exceptionally instructive and interesting nature, and the occasion will form a most valuable opportunity of seeing the latest methods of dealing with a problem of this kind.

On the occasion of a previous visit of the Society some years ago, time did not permit of seeing the Hospice of St. Cross; but this time there will be an opportunity, and the master (the Hon. the Rev. Canon Brodrick) has kindly offered to personally show any of the party over the building during the afternoon.

The outing is open to members and their friends, and ladies are invited. The visit has been timed to follow the first ordinary meeting of the new session, which will have been held the previous day, so that members coming from a distance may make their arrangements accordingly. The party will assemble at Waterloo Station at 9 A.M. and take their places in a saloon carriage, which will be attached to the train leaving Waterloo at 9.20 A.M. The secretary will distribute the tickets en route. Applications for railway tickets and other accommodation must be made not later than Friday, November 9, accompanied by a remittance. Those joining the party en route or at Winchester will make their own travelling arrangements and inform the secretary as to their other requirements.

ROMAN VILLA AT GRIMSTON.

THE site of a Roman villa was recently discovered at Grimston in a pasture near the church. The remains, which lie at a depth of about 12 inches to 18 inches below the surface, were noticed by Dr. Henry Laver, of Colchester, who reported the discovery to the Norfolk and Norwich Archaeological Society, and the Society has, with the permission of the Marquis of Cholmondeley, the owner of the soil, caused excavations to be made. The villa apparently runs from north to south. At the north-east corner was located the hypocaust, or heating chamber of the house, the flue tiles for the hot air being found in some cases in situ. Amongst the debris in the hypocaust were found many fragments of mosaic pavement, with portions of designs, but it had evidently been broken up, and for the most part lay face downwards. Adjoining the hypocaust was found an ash pit, in which, besides ashes, oyster-shells and bones of sheep, pigs and ducks, were discovered some fragments of Roman window glass, some bone pins and the blade of a large knife. Shells of the Roman snail (*Helix pomatia*), which had never previously been recorded for the county, were also discovered. To the west of the hypocaust is a large chamber paved with red tesserae, probably about 30 feet square, although the western boundary wall has not yet been discovered. From this chamber ran southwards a long corridor or passage way, with rooms apparently on either side of it, although the foundations on the eastern side are somewhat indefinite. This corridor is 8 feet wide and about 60 feet long, being also paved with red tesserae. On the western side of the corridor and its southern end are two or three chambers, one being 21 feet square, portions of the others having in recent times been removed in making a pit. In the southernmost of these chambers were found large quantities of wall plaster, richly painted in pure bright colour, and some lined margins, showing that the villa must have been artistically decorated. It is not proposed to continue the excavations any further at present.

The First of the walls of the new Liverpool Cathedral, that of the lady chapel, is now plainly visible. The porch in St. James's Road nearest the choir, affording entrance to the central tower and leading to the foundation-stone, which was given by the mothers of the diocese, has been allocated to the children and young people of the diocese as their gift. A separate account has been opened at the bank called the "Children's Fund," and it now stands at 260s.

NOTES AND COMMENTS.

It cannot be denied that Americans possess a sense of humour, although it is often more grim than what we are accustomed to in England. The *American Architect* refers to an action taken by an architect to recover fees for designing a gaol in which the client desired to incarcerate himself. A wealthy man of Illinois was sentenced by the Federal Courts to a term in the penitentiary. His lawyers, ignorant of his peculiar views, secured a stay of proceedings, and this displeased the convicted man, who desired to get his punishment over as speedily as possible; then he proceeded to Joliet and asked the keeper of the penitentiary there to lock him up, but as he had no commitment papers to proffer, the gaoler was unable to oblige him. Determined not to be thwarted, he declared he would build a prison for himself, hire a more complaisant turnkey and serve his time in aristocratic isolation. He employed Mr. FRANK LINDQUIST, an architect of Chicago, to design the needed prison building. This appears to have been done, although it is not clear whether the building was actually erected or not. In any event, the unfortunate architect is now suing for 3,000 dols. due as commission, a sum which his eccentric client declines to pay, desiring possibly to give conclusive proof that the proper place for him is behind stone walls.

It is to be feared that the origin of the fire at Selby Abbey was in the carelessness of some of the workmen temporarily employed in the building. If that becomes evident, Selby will be only an addition to many other wrecks from the same cause. The organist saw men working by candle-light, and the candles were without shades. The men were also indifferent to the order that smoking was prohibited. The organ-builder said he had noticed a peculiar smell as of scorching or burning at the eastern end of the north aisle, which he concluded was caused by the water near the stoves or the fuel used for heating them. He did not report at the time what he had observed from fear he would be laughed at. Whatever may have been the cause of the fire there can be no question about the interest taken in the rebuilding of the abbey. His MAJESTY participated in the feeling of sorrow so universally provoked by the calamity. Already between 8,000*l.* and 9,000*l.* has been subscribed, and this, with the sum received as insurance, amounts to 18,000*l.* The estimated outlay being 50,000*l.*, the balance which has yet to be raised amounts to 32,000*l.* The committee have been invited to apply for Government aid, and it is not likely that any member of the House of Commons would oppose the granting of assistance in so exceptional a calamity.

THE difficulty of dealing with tenders from contractors living at a distance, and which are found to be lower than those received from local contractors, is continually arising. The best rule to adopt is to accept the lowest tender, unless something is known which is detrimental to whoever sent it and which is enough to excite doubts about the character of the work he will execute. It must be allowed that it is natural to prefer local contractors, for the selection of one of them means employment for local labour and orders for local tradesmen. The Flintshire education committee were last week called on to deal with the difficulty. For a school at Connah's Quay, the highest tender 4,300*l.* and the lowest 3,517*l.* came from contractors outside the district and the county. The Board preferred to accept the tender of a local contractor amounting to 3,554*l.* The difference was not great, but still it deviated from the general rule. For another school the lowest tender was 2,913*l.* An effort was made to have a local tender of 2,980*l.* accepted. But the committee did not care to repeat their action in the first case. Evidently there is little chance for outsiders in Flintshire. The fairest way in all such cases would be to ask the local contractor who is preferred to reduce his tender below the

amount named by an outsider. In that way the interests of the ratepayers, which it is the duty of elected committees to uphold, would not be disregarded.

THE inaugural meeting of the eighty-eighth session of the Institute of Civil Engineers was held on Tuesday, when the president, Sir ALEXANDER KENNEDY, LL.D., F.R.S., delivered an address to the members. He took for his subject the relation of the engineer and engineering to the world at large. In relation to science he pointed out that not a few engineers spend their lives in what is really scientific work, while nominally only earning their daily bread in ordinary mechanical pursuits. He thought that the special nature of the problems with which they had to deal ought to tend directly to produce tolerant and broad-minded citizens. He was sorry that the paths of the artist and the engineer seemed too often to be divergent, but remarked that as soon as engineering works were treated on their own merits, and not as if they were mistaken imitations of other things, it would be found that they could possess even artistic as well as other merits. Everyone now would recognise that there was a dignity in a *Dreadnought* which was almost majestic, and that a modern liner formed really as fine a subject for a picture as a full-rigged ship. The proverb that art is long and life short was truer when reversed. Life continued through all the centuries; art and its "laws" changed with each of them. He spoke at some length about the relation of the engineer to nature, especially in connection with water-power utilisation and mountain railways. No apology was needed for undertakings which gave employment to hundreds of men in places where hitherto no one could maintain himself, or for substituting industrial villages for ruined huts. But the "mountain railways" of Switzerland—and of Snowdon—were merely a product of tourist madness, wholly unnecessary, serving no public benefit whatever, and in many cases, which he instanced, likely to cause irreparable damage to natural beauty. In concluding he spoke of the future of engineering, and of the possibility—which he thought a very small one—of finding anything in mechanical science corresponding to the "survival of the fittest," or any traceable lines along which mechanical evolution took place. He thought that "invention," however, formed such a disturbing influence in engineering evolution that any prophecy on evolutionary lines was impossible. It was still more useless to attempt to forestall the future by trying to do to-day what it is supposed that other people may try to do twenty years hence. The *Great Eastern*, broken up for scrap almost within hail of the *Carmania*, was a pathetic tragedy, from this point of view, in engineering.

LONDON AND COUNTY BANK, ST. JAMES'S STREET, S.W.

PREMISES, 49 PALL MALL.

ST. MARY'S CHURCH, PORTSEA.

EFFORTS are now being made to erect new churches and to increase the accommodation of those which exist in Portsmouth, including Portsea, Gosport and Southsea. It is contemplated, we understand, to add to the church of St. Mary's, Portsea, which was erected at the expense of the late Mr. W. H. SMITH from the designs of the late Sir A. W. BLOMFIELD, A.R.A. It is therefore well to have a record of the building in its present state, for it is an admirable example of modern Gothic and is well adapted to its position. Architecturally it is the most important church in the united towns. And if alterations or additions are necessary we hope they will be carried out with becoming respect for the architect's intention.

CATHEDRAL SERIES.—MANCHESTER: VIEW ACROSS NAVE FROM SOUTH-EAST, SHOWING DOUBLE NAVE AISLE.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting for the seventy-second session of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. T. E. Collicutt, president, in the chair.

Mr. ALEXANDER GRAHAM (hon. secretary) announced the decease of the following members:—William John Gant, Roger T. Conder, Thos. Barnes Williams, F. W. Ledger, Charles Long and Henry William Stock.

The Statutory Examinations.

Examinations of candidates for the offices of district surveyor under the London Building Act, and of building surveyor under local authorities, held by the Institute pursuant to statute, took place on October 18 and 19. Of the seventeen candidates who presented themselves for the district surveyors' examination, nine passed, viz. Horace William Cubitt, London; William Robert Davidge, London; Percie Ion Elton, London; Herbert Kenchington, London; Gilbert Henry Lovegrove, Beckenham; William Herbert Rogers, Hampton-on-Thames; Herbert Shepherd, London; William George Shipwright, London; Collings Beatson Young, London.

These gentlemen have been granted by the Council certificates of competency to serve as district surveyors under the London Building Act.

In the examination of candidates for the office of building surveyor under local authorities the following and only candidate was examined and passed, and has been granted a certificate:—Mr. Harry Prince Healey, London.

At the R.I.B.A. special examination qualifying for candidature as Associate held in Melbourne last June, concurrently with the London examination, two candidates presented themselves and were examined, and the following passed, viz. Samuel Charles Brittingham, of the Public Works Department, Melbourne.

President's Address.

Ladies and Gentlemen,—I take the chair to-night, as president of this Institute, with a very grateful and keen appreciation of the honour conferred upon me by my professional brethren. It is with considerable misgiving and nervousness that I undertake the onerous duties of president, and these feelings are intensified when I remember the exceptional ability my immediate predecessor displayed during his term of office and the invaluable services he has rendered to the Institute. Nevertheless, I can assure you that I bring to this position an equal devotion to the interests of the Institute, an equal enthusiasm in the work it undertakes, and the same unwavering confidence in its future, believing, as I do, that it works for the welfare of the architect and the advancement of architecture.

Before bringing to your notice certain matters which I think of interest, I must ask you to forgive me if I repeat what has already been ably said. Almost every possible question connected with architecture was debated during the Congress which recently met in London, and it is therefore more than possible that much that I say has been better said before. Let me begin by calling your attention to a matter which has occupied the Institute for some time past. During the last few years we have passed through a crisis in our history which at one time threatened to involve us in a kind of party politics, with all the attendant evils that beset party feeling. During that period the question of registration became a very acute one, and it was apparent to all that the whole matter ought to be subjected to an exhaustive inquiry. Such an inquiry has been held by the committees appointed by succeeding Councils. The committee which ended its labours last session submitted an unanimous report to a meeting of the Institute, the general scheme of which was adopted also unanimously. The details, however, were referred to the Council, with a direction that they should draw up a scheme for revising the charter and by-laws, and also a draft Bill which it was proposed to submit to Parliament. The Council then appointed a committee to prepare details of the scheme. This they have done so far as the revision of the charters and by-laws are concerned, and their draft scheme is now under the consideration of the Council. We anticipate that the revision of the charter will improve the position of the practising architect. But in dwelling with equanimity on the pleasant subject of our personal welfare, I do not think we should ignore the sad condition of many of our less prosperous brethren.

This painful subject was brought very forcibly to my mind by the many lamentable cases we had to consider at

a recent meeting of the Architects' Benevolent Society. I venture to draw your attention to the regrettable fact that among 6,000 or 7,000 practising architects in the United Kingdom there are only 447 who subscribe to this deserving Society. Is it not the duty of the more successful among us to help those who are less fortunate? I feel that it must be want of reflection alone that causes so many to ignore the repeated appeals for more generous support that are continually made to the profession. I am afraid that as regards generosity in helping our unsuccessful brethren, we architects do not compare favourably with people of other professions. It may be alleged as an excuse that ours is a precarious calling, but that is merely an additional reason why those who have not prospered should receive help. How much more precarious is, for instance, the theatrical profession; yet we find that actors and actresses are more charitable towards their fellows in distress than any other profession. Actors, authors and managers devote their services and their salaries on one night in each year to the Actors' Benevolent Fund. May I suggest that those who have not hitherto subscribed should take counsel with their hearts and generously open their purses, and that some of the annual subscribers should increase the amount of their subscriptions?

I feel sure it will not be thought out of place, especially by our younger members, if I say a few words on the momentous question of public competitions. It has recently been suggested that in competitions for buildings of any magnitude the responsibility of selection becomes too onerous to be entrusted to one assessor, and that competitors would feel greater confidence in the judgment of two or more. I entirely disagree with this idea, and to illustrate my opinion I venture to remind you of the result of the competition for the proposed Peace Palace at The Hague. This competition being of an international character, it was decided to invite six architects representing various countries to act as a jury of selection. Our Foreign Office requested the Institute to nominate an architect as representative of Great Britain, and our Council did me the honour to elect me to this post. During last April I met my brother assessors at The Hague, and we forthwith embarked on the work entrusted to us. Our committee consisted in all of seven assessors, the president of the Peace Congress acting as chairman and voting with the six architect jurors. In my opinion the combined efforts of the seven jurors resulted in disastrous failure. To my mind the design placed first in order of merit should not have been placed at all. The instructions to competitors issued by the Peace committee stated the proposed limit of expenditure. Now all the assessors agreed that the cost of carrying out the selected design would be no less than double the amount specified. Nevertheless, the jury decided by a bare majority that this design should receive the first premium in virtue of the excellence of its plan. It appeared to some of us that this plan possessed undoubted merits, but that these merits existed only because the designer had utterly ignored the limitation of the proposed expenditure. He would probably be obliged to remodel his plan in order to reduce the cost to a sum approximate to that at his disposal, and the special features that had attracted the assessors would thus be either eliminated altogether or else remodelled to such an extent as to lose the characteristics which had made them specially attractive. With regard to deciding what style of architecture would be most suitable for a monument of international peace and harmony, the majority of the jury inclined towards the Dutch style of the sixteenth and seventeenth centuries. On the other hand, a minority was in favour of a style common in some degree to most European countries. This minority considered that an adaptation of Italian Renaissance would be more international in character and more suitable in every way than any treatment of Dutch architecture could possibly be. However, the wishes of the majority prevailed. In spite of this, the principal characteristics of the design finally chosen were those of a French chateau; but I venture to think that this style of architecture, as illustrated by the successful designer, is not quite appropriate to a public and international building. I have dealt fully, I fear ever tediously, with this subject, because I think the result of the competition indicates that the question of assessors requires careful consideration. Should there be one assessor or a jury of several? My experience at The Hague led me to the conviction that when more than one assessor is appointed an altogether futile conclusion is likely to be the consequence. In this case, as I have pointed out, we were six architects, with a layman as chairman.

The result of our combined labour was the choice of a design which we all agreed could not be executed under double the amount quoted in the instructions to architects. The design chosen was crowded with picturesque towers, gables and roofs, most of which were quite unnecessary. As a supplement to our report we wrote a joint letter to the permanent committee, wherein we advised that the future buildings should be monumental in character and without exuberance of ornament. We suggested that such extraneous features as towers, cupolas, &c., should be considered with the utmost reserve, and in this way our previous decision was completely stultified. I think I have shown that the final decision was a stupendous failure. It is probable that when more than one assessor is appointed the sense of individual responsibility is lessened. Perhaps each member of such a jury undertakes his arduous task with a feeling that the final result will be more or less in the nature of a compromise. In a jury of assessors there is also the possibility of a minority report, which may lead to difficulties with the employers, and perhaps to the abandonment of the awards.

To my mind the ideal arrangement for deciding important competitions is the appointment of one chief assessor aided by one, or preferably by two, assistant advisers to whom he could turn for counsel or help. The assistants or assistant should have no voice in the ultimate decision; the entire responsibility should rest with the chief assessor. Although I have shown that The Hague competition was a failure, inasmuch as the best designs were overlooked, I do not wish to infer by this that I think competitions are a mistake and that they fail to secure the best possible designs. On the contrary, I believe that it is to the interest of the public that a competition should be instituted for every proposed public building of importance. I do not deny that there may be many exceptions to this rule. The new Scotland Yard is a notable instance of such an exception; but the architect of that noble work stands by himself, as is recognised, I think, both by the public and by the architectural profession. It is said that buildings erected from competition designs fail more or less in reaching a high standard of architecture. There is, of course, a good deal of truth in this criticism, but I think it cannot be said with any approach to truth that public buildings, where there has been no competition, reach a higher standard. I think, in the interests of architecture, that every means should be taken to secure the best design possible, and as a rule this can be done by competition. Competition is also invaluable to the young architect for reasons beyond that of striving for a first prize; it gives him the opportunity of comparing his work with that of others and of taking home to himself, if he is modest, his weaknesses. Beyond this there is the chance of discovering genius which otherwise might strive in vain to make itself known.

I think it is a matter of congratulation that the London County Council have decided to institute a competition for the building of their proposed county hall. But I learn with dismay that it is their intention to make it open to architects of all nations. There is no precedent for such a course; and I think a vigorous protest should be made, in the interests of both the English public and the English architect, against a course which appears to be unnecessary and unjust, and one which no other nation would think of adopting. It is no question of dislike to meet our foreign brethren in competition that prompts this protest; it is that I feel that an international competition would be a direct slight to English art, and that it is to the English architect we must look for the production of a design that will illustrate the best traditions of English work.

I feel sure you will share my opinion that the results of recent competitions go to prove that the younger generation is fully qualified to continue that advancement in the art of architecture which we all so earnestly desire. May I none the less offer a word of advice to our younger students? All who have had experience in judging competitions must have been struck with the number of designs submitted by competitors who are evidently in the first stages of their studentship. Let me counsel such beginners to realise that the art of design must be carefully studied, and can be mastered only by continued practice. An important competition does not offer the requisite opportunities for the student to learn his craft.

The Institute has been actively engaged in the advancement of architecture during the last session. I refer particularly to its activities during July last, when the International Congress assembled in London. Unfortunately for

myself, I was then absent from England, and therefore cannot speak from personal experience of the brilliant success which distinguished the various lectures, receptions and excursions. It is evident that these periodical gatherings of our confrères of all nations will have very happy results for architecture and for architects. The least that can be said is that we certainly acquire a closer insight into the aims and aspirations of our foreign brethren, who, we find, are in close sympathy with many highly important subjects now engaging the attention of the Institute. During the assembly of the Congress every subject of interest, from the education of the public to reinforced concrete, seems to have been exhaustively considered. I think we may hope that such questions as the improvement of our thoroughfares, the execution of important municipal or Government work by salaried officials, the education of the public and the status of the architect will not be allowed to pass into oblivion. I have a very strong conviction that there is sufficient energy and enthusiasm among the members of this Institute to keep alive an interest in these questions, all of which tend towards the advancement of our art. That the Congress passed off so happily and was such a complete success was due to the courtesy and tact, and other personal attributes, of its President; to the unflagging energy and ability of the committee, and to the zeal of our accomplished secretary, whose services were indeed invaluable. It has been said in commendation of Count Moltke that he could be silent in several languages. I feel sure that many of our foreign brethren were thankful that Mr. Locke did not consider silence as always commendable. I believe that not the least interesting of the papers read at the Congress were those on the question of the education of the public. Perhaps I may be permitted to add a few words on this subject. It is one of such importance that I venture to reiterate what others have said.

I remember a passage in Ruskin's "Stones of Venice" which bears very directly on this question. Although there is no doubt that in the present day Ruskin is not considered such an authority on artistic matters as he once was, he certainly spoke many words of wisdom. It has been said that there are two classes of admirers of Ruskin, first, those who believe in him as an art exponent, but who think him entirely ignorant of political economy; and, secondly, those who believe him to be a political economist, but who declare he knew nothing of art. However, the words that I will now quote may be put before you, I think, without being challenged in any way. He says:—"Every man has at some time of his life personal interest in architecture. He has influence on the design of some public building, or he has to buy and build his own house. It signifies less whether the knowledge of other arts be general or not: men may live without buying pictures or statues; but in architecture all must in some way commit themselves; they must do mischief and waste their money if they do not know how to turn it to account. And it is assuredly intended that all of us should have knowledge in matters with which we are daily concerned, and not be left to the caprice of architects or mercy of contractors."

I think it may be taken for granted that public taste in painting and sculpture has developed during the last generation, but notwithstanding the advice of Ruskin, it does not seem that there has been such an awakening of public interest in architecture. It is certain that the average cultured Englishman of to-day shows no such appreciation of architecture as did his predecessors. Our ancestors sought culture in the fine arts largely through the study of literature, but more, I think, through home and foreign travel. Undoubtedly far greater numbers travel nowadays, but education in the arts is not really furthered by hurried visits to buildings and galleries, "Baedeker" and "Murray" in hand. In the olden times the grand tour was considered a necessity for every cultured gentleman. In Evelyn's "Diary" there is a most interesting account of the way in which the grand tour was undertaken by one who was *par excellence* the cultured traveller of the seventeenth century. I may remind you that Evelyn spent some years in travelling on the Continent, his travels extending from Holland to as far south as Naples. He was always on the alert to obtain introductions to collectors of art objects, and to those interested in architecture and the kindred arts, thus showing that he devoted a large part of his ample leisure during these travels to the study of architecture and the arts. He was undoubtedly more attracted by the Italian Renaissance and the French phase of that style than by Mediæval work. He speaks of the Farnese Palace as being built after "the ancient manner,

and when architecture was but newly recovered from the Gothic barbarity." Nevertheless there is evidence in the "Diary" that the "Gothic barbarity" appealed to him in some degree, although he owned to a very decided preference for "the ancient manner." The grand tour, without which I believe it is impossible for the layman to make a serious study of architecture, has had a lasting influence on English style. Evelyn was a man of cultivated taste and wide knowledge, and he undoubtedly possessed very great influence in the architectural world of his day. It is certain that his influence was a powerful factor in the decision that the new St. Paul's should be built (to quote his own words) "with a noble cupola, a form of church not as yet known in England, but of wonderful grace." It would be interesting to inquire how far the taste of Charles II. was influenced by an enforced exile in foreign lands. He may have been surrounded by architectural enthusiasts; and his "grand tour" (though limited) must have had some influence on his knowledge and taste. One gathers from Evelyn and from other sources that Charles was really devoted to the arts, and this is shown by his interest in all that pertains to architecture and by his fine collection of pictures and other works of art. We have undoubtedly owed many dukedoms to his initiative; but I seriously think that his enthusiasm for architecture encouraged Evelyn and Wren in their determination to give us a "noble cupola" and a new form of church. I connect the names of Wren and Evelyn thus, not because the latter had any part in designing St. Paul's, but because he undoubtedly had some voice in the arrangement of the plan and the choice of a style. I have cited Evelyn's "Diary" because I think it is shown therein that a successful study and appreciation of architecture can be best obtained by intelligent travelling. But it must be leisured travel; it must not be for the purpose of counting steeples. I am sure that a contemplation of the actual monuments of architecture is always more valuable in the education of the lay public than any other method of study, just as it is in that of the architect himself. No doubt much knowledge may be derived from the extensive writings on the Renaissance of art and literature given us during the last twenty-five or thirty years. But a discriminating taste in works of art cannot be obtained by reading only. Knowledge derived from books must be reinforced by an earnest study of the actual works of the masters. Unfortunately too many people are content to absorb the views of critics, while they neglect a personal study of the work itself.

A question of paramount interest not only to this Institute, but to the public generally, relates to the control over architectural schemes in connection with the laying-out of new streets and the erection of public buildings. This question has constantly been before this Institute, and a variety of suggestions have been made, some advocating a tribunal of art, others an advisory board, working in conjunction with H.M. Office of Works. I believe the present First Commissioner has instituted some kind of advisory body for the purpose of dealing with the Government offices now in progress of building; but this is only a temporary arrangement. The matter is of such universal importance, and the question of want of intelligent control over public undertakings so often arises, that one cannot but feel that this Institute should give special attention to the subject. An architectural tribunal might become an influence in dealing with subjects not directly connected with street improvements or the erection of public buildings. For instance, there is one question suggested by our arts committee on which they have reported, viz. the possible substitution of stone for the present wooden pediment and dome crowning the river façade of Somerset House. It is impossible to conceive that Sir William Chambers would have erected a wooden structure where stone was so obviously the material that should be employed, had not the exigencies of the plan precluded the use of the heavier material. But in this age of steel it would be a comparatively easy and inexpensive matter to add steel stanchions and girders to the interior of the building, and to erect thereon a stone dome. This would only involve trifling alterations to the rooms under the dome. This suggestion may be criticised on the ground that it is not true construction to erect a stone dome on steel stanchions and girders. But I believe that in Sir William Chambers's time, and since, the present dome was painted to look like stone; and this was surely more in the nature of a sham than the proposal now laid before you.

That there is an interest arising in public thought on such matters as the decoration of our public buildings is

testified to by the munificence displayed by some of our citizens in providing the decorative panels to the Royal Exchange. I would, however, venture to say that had some competent authority—such as an art tribunal—been consulted, we should have had a more complete and harmonious scheme. What an opportunity for fine decoration awaits fulfilment in the panels of the Central Hall of the Law Courts! These are really better suited to the purpose than those of the Royal Exchange; they are better lighted and at a better altitude for effect; and, indeed, I believe they were designed by Mr. Street with the idea that they should ultimately be decorated by paintings. The ornamentation of these panels would be a fitting finish to one of the finest halls in Europe. But unless some public-spirited persons, stimulated and advised, shall we say, by our art tribunal, will come forward, this hall will remain, I fear, a monumental example of the want of thoroughness in completion, and of the want of appreciation of art, shown by our nation in general.

That they do these things better in France must be apparent to those who know Paris. Let us hope this was impressed on those of our municipal authorities who lately paid semi-official visits to Paris. It was evident to them, no doubt, that the Parisians complete what they set out to do; that they recognise the importance of placing their buildings in an ample space, and arrange that the surroundings shall be in perfect harmony with the buildings. A false economy of space is not the dominant idea when considering the question of improvements to Paris. The municipal visitors from London probably realised that the French people would not have allowed generation after generation to pass, and still leave St. Paul's crowded in by monstrous warehouses, as we have done. To illustrate how we conduct matters of this kind, I need only mention the work now in progress in St. James's Park. We began well: a design was selected which met with general approval. It was masterly in its conception, and we congratulated ourselves that at last we were in the right direction. We were to have a fitting memorial of our great Queen, the surroundings to which would be treated in a monumental spirit. But what is likely to happen? I am afraid the usual mutilation that ensues from the lack of funds, and I fear it is possible that a feature in Sir Aston Webb's design will be eliminated—the Stone Arcade, a feature which of all others was the one necessary to complete and give full effect to a work worthy of the nation. It is futile to appeal to any Government; but cannot a strong appeal be made, in the interests of art, to a generous English public, to assist in completing well what is well begun? The new building for the Hearts of Oak Benefit Society is a fine object lesson to some of our public bodies in well completing what is well begun. The Hearts of Oak Society, composed, as you know, wholly of working men, has shown a very broad and public spirit in the way it has completed, to the smallest detail, what it set out to accomplish. Let us hope this spirit will be maintained, and that it will not succumb to the modern curse—advertisement—and so allow the building to be defaced by monstrous gilded letters.

I hope it may not be out of place if I take this opportunity of referring to the report of the Royal Commission on the traffic of London streets. This report, issued in June 1905, called forth much criticism and much valuable suggestion from many quarters, but none more interesting to ourselves than the paper read in this room by Mr. Paul Waterhouse. It seems unaccountable that no one fully qualified to approach the subject from an architectural point of view was selected to act on the commission; at any rate, no qualified architect was consulted. Careful readers of Mr. Waterhouse's able paper must come to the conclusion that any inquiry such as the Commissioners were instructed to make should take into consideration the general architectural effect of all proposed new thoroughfares. I think that this Institute should endeavour to make itself distinctly audible when any scheme which deals with London streets is being considered. The papers bearing on this subject which have been read here show that many architects have made a study of this question. But the general public seems to regard it with indifference, and the constitution of the L.C.C. does not always enable it to take the broadest and most statesmanlike view of such matters. For instance, in laying out the Aldwych site the L.C.C. has certainly failed to procure the finest view of those great features, the churches of St. Mary and St. Clement Danes, although at the instance of this Institute some improvements were made to the original plans. In the present construction of the County Council expert qualification is not a

necessary factor. Councillors and aldermen are not elected in virtue of any special knowledge, although undoubtedly there are many amongst them who take an interest in such questions as the present, and who conscientiously study them.

In connection with this question of improvement in our thoroughfares I may refer to the collapse of the Charing Cross Station roof. When this deplorable disaster took place, necessitating as it did the reconstruction of nearly the whole roof and of a portion of the station, it was immediately suggested that a new terminus might be erected on the south of the river. A site on the south side amply sufficient for a much larger station and offices, and also for a new hotel, could have been obtained. The present space occupied by the station and hotel is of such enormous value that the railway company, had they adopted the scheme, would have been but little out of pocket. The gain to the public would have been a new bridge for foot passengers and for wheeled traffic. There can be no doubt that a bridge at this point is much needed, Waterloo Bridge being about 700 yards to the east, and Westminster about 1,200 yards to the south. I believe the directors of the company fully recognised the fact that a terminus on the south side would have been a great improvement from the point of view of the railway requirements. The vast amount of traffic could have been dealt with more easily. The chief argument that could be urged against the removal of the station was the serious objection that the public would certainly make to crossing the river by an open bridge, exposed to all weathers, instead of entering the station by its present easy access. This objection, in addition to the greater distance of the terminus from the City and West End, might have materially affected the suburban traffic, and it probably decided the directors of the company to remodel their terminus on the original site. But it is quite possible that an opposite decision might have been arrived at could it have been shown that a bridge is not necessarily an open structure.

Would it not have been worth while to consider the possibility of erecting a structure on the principle of some of the Mediæval bridges? An obvious suggestion would be a bridge of the type of old London Bridge, the great national wonder of the Middle Ages, and, even as late as the eighteenth century, the only bridge of the capital. Expense, of course, would be a serious objection, but when one considers that old London Bridge was erected by contribution in the reign of John Lackland, one wonders whether it would not be possible to achieve a similar masterpiece in the twentieth century, and by the same means. In the sixteenth century Lyly, the Euphuist, wrote from London: "Of all the strange and beautifull shewes, me thinketh there is none so notable as the Bridge which crosseth the Thames, which is in manner of a continuall street, well replenished with large and stately houses on both sides."

Another point greatly in favour of London Bridge in Mediæval times was the connection it made with the suburbs south of the water. In those days Southwark formed comparatively an integral part of London. Shakespeare would hardly have built the Globe Theatre in Southwark if his patrons had had to face the discomforts of an open bridge. It is the present want of easy and convenient communication between the north and south of the river that prevents the improvement of Southwark and Lambeth. In these localities there is a large area of very inferior property; but if they were more pleasantly accessible from the City and Westminster the congested areas on the north side of the river might be relieved by extension on the south side. In fact, with a street-bridge communication, Southwark might easily become a real part of the City and a more important business centre. Other fine and still existent examples of street bridges are the Ponte Vecchio in Florence, the Rialto in Venice, and the comparatively modern bridge over the Avon at Bath. This last example is, of course, quite a small work; but it serves to connect, as by a street, two parts of Bath that would assuredly have had a different history had the bridge been merely an open one. It may also be instanced as a successful architectural treatment, especially as seen from the river. Of course it might be objected that a street bridge or bridges over the Thames would detract from or even destroy the architectural beauty of the Embankment; and, indeed, any scheme that might endanger the grand effect of this noble work must be approached with the greatest caution. It would never do to imperil the beauty of the only noble engineering work of the last century, nor to spoil the many picturesque

views from our London bridges. But, bearing in mind the examples already referred to, I contend that the Thames might be spanned by street bridges which would not in any way detract from its present beauties. The existing bridges at Blackfriars and Southwark might be metamorphosed into stately erections, and a fine site for another "national wonder" could start from the end of Northumberland Avenue.

At the risk of being thought tedious, I have alluded to subjects which have been more comprehensively dealt with before, but which, I think, are of sufficient importance to bear constant reiteration. It is to be hoped that such questions as the education of the public and the appointing of an art tribunal are within the range of practical politics. We may, I think, assume that the important question of the higher education in architecture which will be open to the student is attracting the attention it deserves. We may anticipate that in the near future a complete scheme will be developed.

The course of study will probably cover a wider range than it has hitherto done. We may hope that it will be more thorough and more complete, and that it will to a large extent insure that all those proposing to practise as architects shall have studied the various periods of architecture and have gained some knowledge of the principles underlying style. Even if education goes no further than this, it will possibly spare us many of the efforts of those who show in their buildings that they have not been taught the first elements of their art. It will save us from the conceited ignorance which thrusts upon us so many vain attempts at originality. At the same time, it is devoutly to be hoped that education will not make us too academic, and that it will not enslave those who feel that they have a message to deliver and an individuality which they must express. Finally, it is to be hoped that it will not result in a dead level of uniformity in our streets, wearisome through too much repetition; for what is good for a hundred feet may become weak if continued for an indefinite length. The education of the architect should tend to bring us into closer relations with the sculptor and the decorative painter. The architect should study the sister arts sufficiently to gain some knowledge of the aims of the artists with whom he may have to collaborate.

Of quite recent years an appreciative sympathy seems to be growing up between the various arts, but in spite of this we still see instances of a want of harmony between architect and decorator, or between architect and employer. An example of this is found at the Old Bailey Sessions House; at one end of the hall is a mural painting which is monumental in character on a fitting and grand scale, and in perfect harmony with its surroundings. At the other end is a decoration which, however admirable in itself, does not accord well either with the architecture or with the other paintings. This incongruity must surely be attributed to the influence of the employers. It is impossible to foresee what the future will bring forth; but so much of the work of to-day is of the very highest order and worthy to be compared with the best that has been done before, that we may look forward to the future in a spirit of optimism. I think that we are all confident that there is still enthusiasm in our ranks and that our younger men are inspired by a vital desire to improve and ennoble their art.

Sir H. TRUEMAN WOOD proposed a vote of thanks to the President for his address, remarking that it had been his privilege to intimate to Mr. Collcutt the award of the Paris Exhibition, when the design for the Imperial Institute gained the grand prix. He was sure such an award was a very much greater compliment than it would be now under the present condition of the entente cordiale, for while their French friends were ready to admit the merits of the English in machinery and manufactures, they were not ready then to acknowledge English ability in art and architecture. There were one or two points in the address on which a layman could express an opinion. The education of the public had been referred to, and the speaker thought if the British public could be made to realise its incompetence in artistic matters the first step in education would have been taken. It was a hopeful sign that the architectural profession was availing itself of the materials which science had created for them, and he believed the possibilities of steel and concrete used in construction offered a great future to architecture.

Sir ASTON WEBB, R.A., seconded the vote of thanks, and in referring to the proposed County Hall for London said they must congratulate the County Council on having selected and obtained such a magnificent site. He agreed

with Mr. Colclutt in reference to throwing open the competition to foreigners, and he was of opinion that for an English hall an Englishman should be the architect. The Memorial work done in St. James's Park was still in an unfinished condition, and the speaker was not in a position at the moment, he said, to describe what would be the final form, but he thought he might say that those who had the work in charge were resolved to bring it to a worthy completion.

ISLE OF MAN CROSSES.*

THE chairman of the Manx Museum and Ancient Monuments Trustees, Mr. Speaker Moore, whose absence on account of serious illness in his family I deeply regret, has called upon me to invite your Excellency to declare this building opened and dedicated for the purpose of preserving the ancient crosses, of which so very many have been found in our parish. Our objects in providing this building here, as also the smaller structures in several other parishes in which to collect the crosses, to protect them from the weather, and to arrange them so that they may readily be examined, and, in having this little ceremony to mark the occasion, may be stated as follows:—First, the honour and glory of God, that God whom we assemble here to worship, even as centuries long ago He was worshipped here by our forefathers, the men to whom these memorials were erected. Secondly, to show our respect for those who were so commemorated, who dying in our faith were here laid to rest, as their children and their children's children, and generations of their descendants, have since been laid—in this hallowed ground to which we still bring our dear ones to their last long homes, where we too some of us hope to rest when, our work accomplished, we are gathered to our fathers; and further, to mark our respect for those who, with faith and devotion and patience and ever-increasing artistic skill, designed and wrought these beautiful monuments. Thirdly, to impress upon all who are here assembled, upon all who may learn of our proceedings this day and upon all who may hereafter come and behold this building, a sense of the priceless value to us of these relics, of our privilege in their inheritance, of the need of their protection, and of the sacred duty which devolves upon us to collect and preserve them, and to hand them on for those who come after us—that they may see them with their eyes and learn from them the many important lessons which they have to teach.

Upon these rude and weathered stones we are able to see and to touch the very handwork of those whose skilful fingers have crumbled into dust more than a thousand years ago. Could they return—picture to yourselves, they would be as much astonished at the altered aspect of the land as we should be were we able to see it as it was in their day. No roads, no hedges, no cultivated fields, no towns—woods and heather and gorse. The streams swollen with a much larger volume of water from the undrained hills, unconfined by banks, spreading over many acres of the lowlands, large lakes and swamps in the north of the island. Reeds and rushes and water-loving plants in the plains, on the hills the purple heather and the golden gorse, everywhere waste lands with woods and an abundance of water. But, standing by their little church, of which the foundations may be seen at the upper end of this churchyard, they would view the same lovely vista of hills trending inland from the high peak of Barrule; they would see the same rugged headland, at the sheltered foot of which their church nestled in the sunshine; they would look as we do on the tumbling waves and gaze upwards into the same skies, bright and clear in the noon-day sun or darkened by hurrying clouds in the storm. And with these men themselves, greatly as they differed from us, we have this thing in common—Christ's religion, with a church in which to worship Him, and this quiet resting-place for the holy dead.

Besides the great number we have in our favoured parish, there are many more of these carved and sculptured stones throughout the island; many have been lost, some have been destroyed, many have been abused and put to ill uses, and very many are broken and worn and sadly defaced. They cry aloud for protection and for more reverent treatment. They are links with the long-forgotten past, our only contemporary records of those dark centuries, our

very precious heritage. These venerable monuments speak to us of the days far off, when the Celtic inhabitants of the island, from whom mainly we are descended, speaking our language with their fellow Celts in Ireland and even in Wales, were being gently led from the rude superstitions and dark ignorance of heathendom to the light of Christianity and the higher civilisation following in its wake, the days when the infant church took root amongst us, when little keels or chapels sprang up throughout the land—through that dismal century when the earlier inhabitants were pillaged and plundered by the fierce pagan hosts, who descended upon our shores from a far-distant northern land, when this green churchyard was converted into a stronghold and defence, of which the traces still remain—through those more peaceful days when the Scandinavians, already half-Celticised by their long stay in the western isles of Scotland, came to settle friendlywise among them, mingling and intermarrying with them (so that their blood also runs in our veins), adopting their customs, adopting their religion and becoming leaders in the Church and in the State—for we read of one, Roolwer, a Scandinavian bishop, who died about the year 1060, "who," says our Chronicle, "lies at the church of Saint Maughold," his monument being, as I believe, among those in our collection—through this long eventful period till, finally, the power of the Norsemen in the British Isles was broken and, after an occupation of nearly four centuries, they returned to their own homes. After that, when peculiar monuments ceased to be erected, this special art died out, giving place to the Gothic introduced from the north of England, of which the finest remaining example is the very beautiful pillar-cross of the fourteenth or early fifteenth century still standing at Maughold Church gates.

I cannot now occupy your time by a description of the stones in our collection, but perhaps you will allow me to refer briefly to four or five of the most interesting. The earliest is probably the small slab with the simple linear cross and circle, of a type met with in the sixth century. This was found some years ago by the late Mr. Looney a little below the ground by the south wall of the ancient keel or chapel of which the foundations may be seen in the north of our churchyard. These little keels with their accompanying burial-grounds—our only material remains, besides the crosses, of the early Celtic Church—were once very numerous in the island, and it is remarkable that no fewer than ten of the crosses in our collection came from as many keels, viz. from Ballakilly, the estate close by Ballateron, Ballure, and in the other direction Ballafayle, Ballaglass, Ballagilley, Cardle, Corna and Coilleen, and the Dhoon. Of all these Ballure alone survives as a church in use. Would that it were in our power to preserve even what little still remains of these ancient buildings as we can the crosses found beside them. Another early stone is interesting as being the only one in the island which bears an inscription in the Anglian runes, such as we find used in the seventh century. On it we read the name Blagkimon, which in varying form is a known Saxon personal name. In its first syllable we have it amongst us as a surname to this day. Here, also, are two out of the only three in the island which are in Latin, one of them, erected to a bishop, bears in contracted form the words, "Episcopus Dei Insulis," the lettering and general character of the carving showing it to be probably of the seventh or early eighth century. The other stood for over fifty years on the hedge at Port-y-Vullen, having been brought from the little keel, through the site of which the road to Gob Agr now passes. When the stone had fallen from the bank (the second time within my recollection), I discovered across one edge the brief inscription Crux Guriat. It can with some certainty be dated as early as the ninth century. Another bishop is commemorated on a broken slab, which for many years served as a lintel to the east window. No inscription remains, but we see the figure of the bishop with a closed book on his breast, beside him his pastoral staff. The design and execution of this belong to the tenth century. Yet another on the monument of Bishop Roolwer, to whom I have already referred.

A stone of very great interest is that which I had the great fortune to obtain a few years ago from a house in the town of Ramsey. It is one of the four in the island bearing illustrations from the great Norse hero-Saga, the story of Sigurd slaying the dragon "Fafosi"; and, just as in Sweden a great granite boulder so decorated is supposed to have been erected to a descendant of Sigurd, so, I surmise, these monuments in Man were erected to members of our royal race, who through Olave the White, of Dublin, claimed a

* An address delivered at Maughold by Mr. P. M. C. Ker-mode, president of the Manx Antiquarian Society, before the Governor.

similar descent. Now, one of our own kings, Olave, is recorded in our Chronicle to have been treacherously slain at Ramsey about the year 1153, and this stone may have been set up to his memory at Ballure, the nearest consecrated ground. As the house where it was found was built a hundred years ago by Christian Ballure, it is easy to account for its removal there. I will refer only to two others, the latest in our collection. They are not tombstones, but small unhewn weathered slabs with inscriptions in the later runics of about the year 1200. One was found below the old keeil in Corna Valley. The inscription begins with an invocation to Christ and the great Irish saints, Malachi, Patrick and Adamnan, adding the words, "Of all the sheep John is priest in Cornadale." The other, carved by the same John, was found here during the extensive repairs in 1900—appropriately enough by a priest of our day, the present vicar of Maughold, John's official successor. It bears the words, "John the Priest carved these Runes," and this is followed by the Runic alphabet and by another in oghams.

I trust that what I have said will serve to convince you of the interest and rare value of these remains; much might be added of their artistic merits. They are our heritage, national monuments in the truest sense of the word, and it is incumbent on us to preserve them. And now, to show that we rightly appreciate our privilege in their possession—yet not as absolute owners, but as trustees for posterity—I beg of your Excellency to declare this building opened and dedicated for their preservation. I am told that I should say a word as to its unfinished state. The reason for that is that the trustees were anxious to meet the wishes of the parish in having this ceremony on the same day as their harvest festival and annual show. Personally I do not think it matters a bit whether it is backward or forward, our desire being to call your attention to the fact that this work is being carried out, and by our ceremony to-day we wish to mark the good work upon which we are engaged, of preserving all such monuments throughout the small but ancient kingdom of Man.

THE LATE J. T. MICKLETHWAITE.

IN his sermon on All Saints Day the Dean of Westminster made the following allusion to the loss which the Abbey has sustained in the death of J. T. Micklethwaite, F.S.A.:—"Yesterday we laid in the cloisters an eager, reverent, skilful, experienced worker. A learned and wise antiquary, who brought the knowledge of an architect to illuminate the problems of our monastic buildings, and had come to be a recognised authority in all ecclesiastical antiquities. John Thomas Micklethwaite studied this abbey during the main part of his life, and for the past eight years filled the very ancient office of *supervisor operum*, surveyor of the fabric of this church. He gave his whole heart to this place, and jealously guarded every fragment that could tell of its long history. He had no rival in his love for it and his knowledge of it, save our venerable clerk of the works, Thomas Wright, whom we lost a few months before him. When we think of the passing into the eternal silence of voices that alone could answer questions that again and again must be asked, we rightly call our loss irreparable. But the man who has served his generation by the will of God has done work that abides. He falls asleep as the old builders, whose work he cherished, fell asleep in the midst of unfinished tasks. But the work abides and grows. 'God buries His workmen, but He carries on His work.'"

THE CASTLE OF NEWCASTLE-ON-TYNE.

THE property and sanitation committee of the Northumberland County Council have reported that communications have passed between the Duke of Northumberland and Mr. Robert Blair, secretary of the Newcastle Society of Antiquaries, regarding certain remains of the old hall of the Castle of Newcastle which had been unearthed in operations connected with new buildings at the Moot Hall.

Mr. Blair's letter to the Duke suggested that if the County Council would instruct their officials, on the uncovering of any ancient remains, to defer demolition until they could be examined, it would be a great benefit to archaeology, and probably to the elucidation of the history of Newcastle. The Duke, in forwarding Mr. Blair's letter to the

county surveyor, said it seemed a great pity that any ancient remains which might possibly be preserved intact should be destroyed. At any rate, an opportunity should be given for recording any discoveries that might be made. The county surveyor, in reply, stated that architects, including Mr. Knowles, were on the site almost immediately they discovered a wall passing within the outside wall of the new building. Every opportunity was given them to visit the site, and immediately any fresh discovery was made verbal notice was sent to Mr. Knowles, and he measured the discoveries and took levels of them. He felt that the secretary of the Newcastle Society of Antiquaries was under a misapprehension as to what he had done in connection with ancient remains. In practice it had always been his view, as in this case, to give every opportunity to those interested to visit ancient remains before they were interfered with.

The county surveyor further reported that Mr. Knowles had prepared a sketch and requested that the area lights should be rearranged so as to leave both sides of the old walls open to view for all time. He (the county surveyor) pointed out that if this and other suggestions were carried out it would spoil the entrance to the Weights and Measures Department and destroy a light, and it would also be impossible to put in a proper and safe foundation for the building.

STRAND IMPROVEMENT.

A MEETING of the Further Strand Improvement Committee was held on Saturday at 1 Pall Mall East, Lord Kinnaird in the chair, when a letter dated November 2 was read from the Clerk of the London County Council as follows:—"I have to inform you that the Council has come to no recent decision with regard to the frontage of the Strand at the south-eastern corner of the crescent site. The improvements committee in July last submitted a report advising the Council to confirm its decision of October 20, 1903, to the effect that no alteration be made in the frontage. This report was, however, withdrawn, and the matter is being further considered by the committee. Any decision that the Council may pass will be at once communicated to the Further Strand Improvement Committee." Mr. Mark H. Judge, honorary secretary, proposed the following resolution:—"That as the whole of the middle and eastern sites between Aldwych and the Strand are still in the market, this committee hereby resolves to make an offer to the London County Council for the use of 300 feet of the frontage of the eastern site, next the Strand, for the erection of a hoarding 30 feet high, in order to demonstrate how buildings on the present line of frontage would mar what would otherwise become the noblest thoroughfare in the Metropolis, leading to and from Buckingham Palace, the Houses of Parliament, Westminster Abbey, the National Galleries, the Royal Courts of Justice and St. Paul's Cathedral; that the offer be a sum of 50*l.* for the use of the frontage for three months, and for such further period as the County Council may be willing for the hoarding to remain a rental at the rate of 600*l.* per annum." Mr. Hutchinson Harris seconded the resolution, and after discussion it was adopted unanimously.

THE EMBANKMENT TREES.

THE attention of the parks and open spaces committee of the London County Council has been directed to the fact that, by reason of the construction of tramways near the kerb on the river side of the Thames Embankment, a considerable amount of pruning and lopping of the trees on that side is necessary to allow the use of double-deck cars on the lines, and the highways committee have asked that, in view of the early opening of the tramways for public traffic, the work may be undertaken with as little delay as possible. From an examination made with the aid of a template, 16½ feet in height, with a projection of 19½ inches corresponding to the distance between the kerb and the near side of the cars, it has been found that one tree, or possibly two, near Westminster Bridge will have to be removed, and that the 165 trees, with few exceptions, will require pruning to some extent. It is, of course, difficult to state exactly what the general effect will be until the work is completed, but the amount of pruning and lopping to be done between Westminster and Waterloo Bridges will, it is anticipated, be but slight. The treatment of the trees between Waterloo and Blackfriars Bridges will, however, be somewhat more severe in consequence of the more

stunted growth of the trees. It is pointed out that the trees on the side next the road have already been pruned to accommodate the ordinary vehicular traffic, and that the additional lopping now required will necessitate some corresponding thinning on the opposite side of the trees. Moreover, in sinking the shafts in the footway in connection with the construction of the tramways the roots of ten trees have been severely cut, so that it may be necessary to replace the trees at a later date. It is proposed to make arrangements for such work as may be necessary to be done at once, but the committee express regret that the highways committee did not inform them, either during the progress of the Bill through Parliament or before operations were commenced, that it was proposed to construct the tramways so near the kerb as to affect the trees in any way. The work was commenced during the recess, and it was not until some damage had been done that it was ascertained that the proposal was one affecting the trees, the control and maintenance of which concern the parks and open spaces committee.

FRENCH ROADS.

THE American Consul-General at Paris, Mr. Frank H. Mason, in a report to the Washington Bureau of Manufactures, states that during the past summer certain American tourists, travelling by automobile through France, complained that they had been annoyed by the coal-tar on certain roads adhering to the wheels, and thereby being spattered over their car and clothing. He says the impression created in some quarters by this statement has been that tarred roads have not on the whole proved successful. The treatment of macadamised roads and streets with crude petroleum as a preventive of dust in summer and mud in winter was first attempted in Southern France ten or fifteen years ago, and appears to have been successful for the suppression of dust caused by ordinary traffic. But for obvious reasons the use of petroleum soon gave way to that of coal-tar, which has the additional advantage that, unlike oil, it hardens when exposed in a thin layer to the action of the air, covering the surface of the road with a practically air and watertight skin, which not only holds down the dust in dry weather, but prevents water from penetrating the roadway in time of rain, provided the road itself is well constructed and the tar properly applied. One of the first important experiments made by the French Department of Bridges and Roads was on the national route from Oran to Mers-el-Kebir, in the Algerian Department of Oran. The success of the system was fully demonstrated, and it has since been adopted and applied to many country roads and macadamised city streets throughout France with uniform success wherever the conditions have been normal and the work properly and thoroughly performed. Tarred roadways are not recommended for steep grades, where their smooth surface might be slippery and dangerous for horses.

DAMAGE TO WATERLOO BRIDGE.

THE highways committee of the County Council report that their attention has been directed to an accident which occurred on Waterloo Bridge on the afternoon of October 30, when a motor omnibus proceeding northwards mounted on to the pavement of the bridge on the west side and collided with the parapet, which as a result was considerably damaged. In view of the very serious consequences which might have ensued they have thought it right to place the facts before the Council without delay. It appears that the parapet was damaged for a length of nearly 125 feet, some of the granitework of the bridge being knocked into the river. Owing to the parapet of the bridge being of exceptional strength the vehicle, fortunately, did not fall into the river. This is the third occasion, within a short period, on which a similar accident has occurred to a motor omnibus on this bridge, and there can be no doubt that in each case a very serious accident would have taken place but for the reason above stated. On April 4, two motor omnibuses collided at the southern end of the bridge, and as a result the parapet was damaged for a distance of nearly 40 feet, while on October 15, a motor omnibus mounted the footway of the bridge on the upstream side and damaged the parapet. The parapet, as well as the structure of the bridge, was at the time of the accident in excellent condition, and the carriageway was relaid three years ago and was repaired about two months since, and it is clear therefore that the condition of the

bridge did not contribute to the accidents. The highways committee are of opinion that, in view of the grave consequences which might result from accidents of the kind in question, and having regard to the central position of Waterloo Bridge and the enormous volume of traffic crossing the river at this point, the question of the control of the traffic on the bridge, particularly motor-omnibus traffic, requires very serious consideration. It is therefore suggested that a statement of the facts should be forwarded to the Local Government Board, which has under consideration at the present time the question of amending the order at present in force relating to heavy motor cars on bridges, and also to the Commissioner of Police of the Metropolis.

Riddrie Competition.

SIR,—I enclose a copy of a letter which has been forwarded to the town clerk of Glasgow regarding this competition, and as the matter is of some public interest, I shall be glad if you can insert it in your valuable Journal.—Yours faithfully,

C. J. MACLEAN.

Sir,—My Council have had the conditions of this competition under consideration, and have agreed upon the following expression of opinion, viz. :—(1) The premiums offered, viz. 75*l.*, 50*l.* and 25*l.*, are inadequate, and there is no guarantee of employment given; (2) there should be an independent assessor to advise the committee; (3) the plan of the ground that is supplied to the competitors does not give any levels or the necessary information for laying out roads and forming sewers; (4) there is no indication given of what drawings are required and the scale they are to be.

As my Council understand there will not be a meeting of your committee for some time, I was instructed to send this letter at once to the public Press.—I am, yours faithfully,

C. J. MACLEAN,

Secretary, Glasgow Institute of Architects,
115 St. Vincent Street, Glasgow :

The Town Clerk,
City Chambers, Glasgow.

October 31, 1906.

Bexhill Council School.

SIR,—The following official advertisement caught my notice:—"The Bexhill education committee invite applications from certificated and trained teachers for the appointment of head-mistress at the new Council school, Downs Road, which has recently been erected from the designs of Mr. Burke Downing, F.R.I.B.A., Westminster. Accommodation 400. Mixed school, girls and infants." It is obvious that the committee attach considerable importance to the fact that their school was designed by Mr. Downing, and presumably expect that it will attract applications equally with the salary. This tribute to architectural practice opens out a wide range of possibilities. If the head-mistresses of Board schools are so intimately concerned in the design of their daily surroundings it is reasonable to conclude that the same spirit will pass down from them through the teaching staff to the pupils. These pupils will when leaving school and watchful for situations have stringent standards to apply before they are satisfied. Thus housewives when desirous of engaging a domestic may have to promise to decorate the servant's quarters according to the new-comer's fancy. The taste of one housemaid would render life to a sensitive successor a misery as long as she had to look at the same colour scheme, wall-paper, &c. It is unwise to think what will happen when the same establishment contains several servants with individual artistic temperaments. Perhaps the cook will be arbiter of taste. This suggests what may shortly happen in respect of interior decoration. Yet if the æsthetic education of the Board-school girls logically progresses (and with it the servant problem), is it not possible that they may refuse to enter service until the entire house is in harmony with their ideals? A Mary Anne style of architecture, in fact.

If all the foregoing is by way of intelligent anticipation, the advertisement quoted at the commencement of this letter is a indisputable fact. I venture to think it incomplete. Head-mistresses might be glad to know where they

can see a view of the school without journeying to the place. To satisfy them a reference should be given to the professional journal in which it appeared. Thus the Bexhill education committee should have added "vide *The Architect*, May 11."—Yours,
F. R.

GENERAL.

The King of Greece has invited M. Rodin, the sculptor, to visit him at Athens, and the invitation has been accepted.

Mr. Reginald T. Blomfield, A.R.A., formerly scholar, has been elected to an Honorary Fellowship at Exeter College, Oxford.

M. Van den Broesche, the Belgian sculptor, has died in Ghent in his fifty-second year.

M. Fritz Thaulow, the Norwegian painter, died at Vollandam on Monday in his fifty-ninth year. His weird representations of bridges and of houses on the banks of rivers were admired in recent exhibitions of the Royal Academy.

Selby Abbey was insured for the sum of 10,000*l.* This will leave a balance of 32,000*l.* to be collected by subscription.

Mr. J. Thomas Micklethwaite, to whose death we alluded last week, was buried on October 31 in the cloister of Westminster Abbey.

The Cambridge University Antiquarian Committee, in their report for the year 1905, again draw attention to the overcrowded state of their galleries. In fact, a warehouse has had to be hired in which many objects are stored out of sight. The need of a new building has become pressing. The University has a site, but beyond 1,500*l.*, either collected or promised by Baron von Hugel, the director, there are no funds for the erection of a building.

Mr. Rowland Plumb has been selected by the Edmonton Board of Guardians to judge the competitive designs for its new infirmary, which is expected to cost 200,000*l.* The architects invited to compete are Mr. Stuart Hill, Mr. W. H. Ward, Mr. Marcus Collins, Mr. A. E. Pridmore and Mr. W. A. Pite.

The Carnegie Dunfermline Trust have reported that architects had been invited to submit competitive designs for the erection of a branch library in Baldridgeburn Street at an estimated cost of 4,200*l.* Premiums of 20*l.*, 15*l.* and 10*l.* respectively are offered for the three best designs after the one (if any) which may be accepted. The accommodation to be provided is as follows:—A reading-room and a room for games, which could be thrown into a lecture hall, with about 300 places; a children's reading-room, a ladies' room, a billiard-room to accommodate two tables, a smoking-room, a library and librarian's room, lavatories, and a caretaker's house.

"A Manchester Alphabet" is the title of a brochure by Mr. Roger Oldham, and published by John Heywood, Ltd. That the city can supply twenty-six subjects for humorous illustration is creditable to it as well as to the artist and poet. It will afford enjoyment to others besides inhabitants.

At the Meeting of the York Town Council on Friday one of the members proposes to ask that a special committee be appointed to inquire into the circumstances in connection with the recent cleaning and restoration of the pictures in the Burton Art Gallery, particularly as to the alleged damage done to several of the pictures (especially to one entitled *The Drovers*, by Ansdell and Frith, and another, *The Saxon Sentinel*, by Watts), with the view of ascertaining, if possible, by whom the alleged damage was done.

The Council of the Institution of Civil Engineers on Tuesday made the following awards:—Telford gold medal to J. A. Saner, Watt gold medal to G. G. Stoney, George Stephenson gold medal to T. E. Stanton and Telford premium to Leonard Bairstow. Telford premiums to H. S. Bidwell, J. J. Webster, C. W. Methven, H. A. Mavor and Sir F. R. Upcott; Manby premium to D. E. Lloyd-Davies, Telford gold medal to G. A. Denny, George Stephenson gold medal to W. E. Dalby, Telford premiums to W. R. Baldwin-Wiseman, G. N. Abernethy, H. R. C. Blagden, M. R. Collins and James Kelly; Crampton prize to P. T. Gask, the James Forrest and the James Prescott Joule medals and a Miller prize to A. F. Harrison, Miller prizes to Ralph Freeman, A. J. Grinling, T. R. Grigson, J. D. W. Ball and Arnold Morris.

Mr. B. T. Batsford will issue in a few days a new volume of "Decorative Plant and Flower Studies" by Miss J. Foord. It will contain forty coloured plates of studies of different plants to those represented in the first series issued four years ago, and numerous sketches and studies of detail will be given in the text.

Mr. James Ransome, consulting architect to the Government of India, has, *Indian Engineering* understands, signified his intention of severing his connection with the Government of India on the termination of his present agreement, which expires some time next year. It is supposed that Mr. W. Banks Gwyther, P.W.D., Bengal, will succeed him.

The First Commissioner of Works having been asked in the House of Commons whether he would ascertain what arrangements, if any, were being made to remove the three houses at Charing Cross, the removal of which was necessary to complete the Charing Cross end of the Mall improvement, and how the requisite funds would be provided, Mr. Harcourt, in reply, said:—"I am not aware that any arrangements are being made to remove any houses at Charing Cross. This is, in my opinion, a metropolitan matter, and as such appertains to the business of the London County Council."

The Drama Society propose to give a preliminary performance at Chester on November 29 of three of the Chester Mystery Plays, namely "The Salutation," "The King's Play," and "The Shepherd's Play." Professor Gollancz, to whom the plays will be submitted for revision, has promised to deliver a lecture on the plays at Chester on November 20.

The Wolverhampton Art Gallery and Museum have been visited during the past official year on an average by 258 persons daily. The attendance on Sunday afternoons shows an increase.

The Baths and Parks Committee of the Birmingham Corporation recommend that they be authorised to obtain competitive plans for the erection of a suite of baths in Nechells Park Road at an estimated cost, including the necessary engineering-work, of 21,995*l.* 3*s.* 2*d.*, and to submit the selected design for approval. The ground plan of the baths was submitted to and approved by the City Council at its meeting held on October 24, 1905.

Banwell Abbey, in Somerset, is to be put up for sale. The stone-built fourteenth-century abbey, now adapted as a residence, contains modern accommodation, coupled with the historic chapel, cloisters and hall in the old-world grounds. The first building on the site was a Saxon monastery founded by King Alfred. This was destroyed by the Danes, but after the Conquest was several times restored by the bishops of Bath and Wells, particularly by Bishop Drokenesford in 1309, Bishop Beckington in 1443 and Bishop Oliver King in 1449.

The County Property Committee of the Cumberland County Council have passed the following resolution:—"That authority be given to the county architect to carry out urgent and needful repairs to county property under his charge which may at any time be necessary, to an amount not exceeding 10*l.*, but that all proposals for new work be submitted to this committee for approval before being proceeded with; and that if any further necessity arises to exceed the sum of 10*l.* for urgent repairs the matter must first be referred to the chairman of the committee for approval."

Mr. W. D. Caroe, in the course of a report on the condition of the parish church at Blofield, Norfolk, says:—"It is a matter of great importance that the ancient seats should be retained. These are complete, and some of them among the most interesting in the country. They hand down to us in a remarkable degree the comforts which our forefathers were prepared to accept as sufficient for their needs. That we demand more ease gives us no warrant for sweeping away excellent work coeval with the structure itself and designed for it. The present oak backs appear to me to have been skilfully devised, and if their designer had added a little more width to the ancient seat they would have been fully up to our modern demands. This addition can now be made, and at the same time a book-ledge might be added, similar to that at Hemblington. There are sixteen old bench ends still available, and these can be used in extending the seats westward. The present deal screen, which is merely an eyesore of less than no value, should be removed to admit of this. The box pews in the aisles are deal, and have no merit to warrant their preservation, while they are wasteful of space. Oak seats should be introduced to replace them and regain the proportion of the church."

The Architect.

THE WEEK.

THE judgment in the case *COLLS v. Home and Colonial Stores*, although it has to be respected, is not endorsed by all lawyers in England. It seems remarkable that a decision relating to the diminution of light in a house let at 26% a year should be delayed in the expectation that the result of *KINE v. JOLLY* would modify the important judgment which Mr. COLLS obtained. All that *KINE v. JOLLY* has taught is how easily a large sum of money can be wasted in carrying a case from court to court. The action which was delayed related to a house at Tuebrook, Liverpool. The owner brought an action against a lady who built a house within 15 feet of his own, and by so doing interfered with the light of his back parlour. It was tried before the Vice-Chancellor at Liverpool, and judgment was deferred, as we stated above. On Monday judgment was given. The Vice-Chancellor said it had been proved that the land on either side of the house had been laid out for a building estate, and that plaintiff's house must have been built under that knowledge. His visit to the premises on a dull day showed that the room received ample light for all purposes. If there was any diminution in the letting value it was not due to the light, but to the proximity of other houses. Adopting the words of the Lord Chancellor, his Honour held that the defendant had left to the plaintiff amply sufficient light for ordinary purposes according to the general notions of mankind, having regard to the locality and the surroundings, and accordingly gave judgment for the defendant with costs, except as agreed.

It cannot be charged against contractors and workmen that time was lost in erecting the new War Office at Whitehall, of which there was a private inspection on Tuesday. The building has to accommodate about 2,300 officials, and, moreover, it possesses a rather grandiose character. Yet the works have occupied little over five years. When the other buildings in Whitehall are completed INIGO JONES's Banqueting Hall must appear as a very modest example of architecture, and it may be forgotten that it is only a fragment of what was to be a noble palace. The late WILLIAM YOUNG, in his design for the War Office, showed some reverence for the old building which was to stand near it, for although in the first competition columns of immense height were in favour in order to impart majesty to the exterior, his Ionic columns are restricted to the height of two floors, and in a perspective they do not appear more imposing than JONES's. The site was rather difficult to deal with, and it must be allowed it was turned to excellent account. There is far greater variety than is seen in the Banqueting Hall, but in no part is it carried to excess, nor is it acquired by any petty details. The architect's aim was to have a striking building which could be regarded as a whole, and we need not object because he has exhibited more courage than BARRY when he was altering the Treasury buildings on the other side of Whitehall. The sculpture by Mr. ALFRED DRURY, A.R.A., is really decorative and suggestive of the purpose of the building. The interior could not be fairly judged, for everything was new. But the staircase is well adapted for the display of uniforms, and the rooms of the principal floor will gain in effect by time. Since the death of Mr. YOUNG soon after the works began, the building has been carried out by his son, Mr. CLYDE YOUNG, who has been aided by Sir HENRY TANNER. The contractors were Messrs. FOSTER & DICKSEE, of Rugby.

THE statistics of a large building are always found interesting. According to information, there were used in the War Office 25 millions of ordinary bricks,

1½ millions of glazed bricks, 26,000 tons of Portland stone (supplied from the quarries of the Bath Stone Firms), 17,000 tons of Portland cement, 3,000 tons of York stone, 9 miles of chimney flues, 17 miles of plaster cornices, 50 acres of plastering, 3,500 tons of steel floor joists, 7 acres of asphalt, 18,000 yards of mosaic and 2 acres of glazing. The principal front to Whitehall is 250 feet long, the south front to Horse Guards Avenue is 320 feet long, the east front to Whitehall Avenue is 370 feet long, and the north front to Whitehall Place is 500 feet long. The steps of the main staircase are of Pistraccia marble, with alabaster balusters and Brescia capping. The pilasters, arches, &c., are of Painswick stone. The building is heated by steam, and 250 hydrants and about 3½ miles of piping are employed for this purpose. The fire appliances consist of a complete system of mains, with 106 hydrants. For lighting there are 5,601 16 candle-power and 303 8 candle-power lamps. There are 5 electric passenger lifts, 10 hydraulic goods lifts, 2 dinner and 5 paper lifts. The length of insulated wire in the building is 104 miles, and there are 21½ miles of steel tubing, 20½ miles of wood casing and 10 tons of shot in counter-weight fittings.

At one time it would be considered strange to find architects tendering for a commission. But the world has become accustomed to so many revolutions in architectural practice, an experiment of the kind excites little attention. The education committee of the Rochford Hundred, in Essex, are about to erect a girls' school at Rayleigh, and they invited architects to state on what terms they would render their services. They received the following offers:—Mr. DOUGLAS H. SMITH, 4 per cent.; Mr. CHARLES COOKE, 3½ per cent.; Messrs. CABUCHE & HAYWARD, 5 per cent.; Mr. W. Y. HOBBISS, 3½ per cent.; Mr. W. J. WOOD (lump sum), 50%; Messrs. CLARE & ROSS, 4 per cent.; Messrs. BURLS & HARRIS, 5 per cent.; Mr. F. E. SNEE, 5 per cent.; Mr. S. I. ADAMS, 3½ per cent. Out of the list the offers of Mr. HOBBISS and Mr. ADAMS were selected for consideration. Finally the terms of Mr. S. I. ADAMS were approved. That gentleman stated that his percentage was based on the understanding that Thundersley schools were being erected at or about the same time, so that one journey would cover both; but the committee declined to be bound by such a stipulation. According to the chairman, the percentage is to be calculated on the total outlay. No objection was raised by any member of the committee concerning the arrangement, and it is to be feared that a similar process will be adopted in other cases.

THERE has been a discussion in Edinburgh concerning a new municipal art school. The inquiry, which was held in the city by a Government commission, showed that rivalry existed between the art classes of the Scottish Academy, the Royal Institution and the Heriot-Watt School. The art school committee of the Town Council have prepared a report recommending the erection of a school which would serve not only for Edinburgh, but for students of the south and east of Scotland. It would be called the Edinburgh Municipal College of Fine Arts and School of Arts and Crafts. The old cattle market in Lauriston Place is suggested as a site, and the estimated outlay on buildings and equipment is put down at 50,000/. The course of instruction would comprise painting, sculpture, architecture and decoration. There would be room for 2,000 students. The general accommodation would be 15,205 feet; painting section, 11,196 feet; sculpture, 6,830 feet; and architecture, 6,982 feet. The total area would be 66,327 square feet. It is considered that the school would enable Edinburgh to regain the position it once had acquired as a centre of art, especially as the latest methods would be employed in teaching.

HERCULANEUM.

THE announcement that the Italian Central Commission of Antiquities and Fine Arts have approved of Professor WALDSTEIN'S project for the excavation of Herculaneum shows a surprising degree of liberality. The whole history of the attempts to reveal the buried city during the last two centuries has been marked by the most remarkable dog-in-the-manger spirit known in the history of archæology. When Naples was a kingdom a fierce jealousy was displayed towards inquirers who came from other parts of Italy, and still more of foreigners. Now that Italy has become united it is felt by those who have the interests of the country at heart that the condition of Herculaneum is discreditable to the people and Government of Italy, and that an effort should be made to imitate the action of countries like Turkey and Greece. But the conditions of the acceptance of Professor WALDSTEIN'S proposal are still marked in a large measure by the old spirit. Foreigners will enjoy the privilege of contributing towards the expenses of the excavation, but the money is to be controlled by an international administration under a president to be nominated by the King of ITALY, and who doubtless will be an Italian. The execution of the work will be directed by a commission, one-half of whom will be Italian. All the information concerning the discoveries is to come from the Italian Government, and Italy is to retain possession of whatever is found. Foreigners will recognise the justice of the last condition, for it corresponds with the practice in other countries. But it is to be feared that the interference of Italians with the excavations will be prejudicial to the success of the enterprise.

It was in 1706, or exactly 200 years ago, that the existence of Herculaneum was revealed. Prince EMANUEL OF LORRAINE, who had settled at Portici, then ordered the erection of a villa. For plaster he proposed to utilise some crushed marble. He was informed that people in the town knew of the existence of a pit or well, and on descending by it they were able to find not only pieces of marble, but statues and mosaics. The Prince wisely secured possession of the well, as well as of rights of search. It was about 90 feet deep, and in passing downwards it was not difficult for a trained eye to realise the remains of different towns. The ancient city which was overwhelmed in A.D. 79 was used as a site for other cities which were also destroyed. It was therefore not strange that the city known as Herculaneum was forgotten. The Prince D'ELBŒUF, for that was the title by which he was known, carried on explorations for a few years. At such a depth the work resembled mining, with the difference that in mines there are plans to be followed and the lines of the strata serve as guides. At Herculaneum there could be no plan, and the men burrowed around, regardless of what was destroyed, so long as they obtained a statue, or a part of one, or a mosaic. The French president, DE BROSSES, who descended in 1739, said that owing to the absence of air he was unable to examine the place without going every few moments to the opening in order to continue breathing. He tells us he could discern walls which were examples of *opus reticulatum*, others adorned with mosaics, large slabs of marble and frescoes representing flowers, birds, animals and other ornamentation, but even lighter in style than arabesques. He could also see columns, bases, capitals, fragments of statues and of furniture, pieces of bronze, and in his presence an inscription was discovered which appeared to be a list of municipal magistrates. He recognised that they were in the presence of an amphitheatre or of a theatre. He was also able to perceive the remains of a street, along which were covered benches. DE BROSSES was informed that it led to some public building with porticoes which contained much fresco-painting, columns and statues of men seated in curule chairs. DE BROSSES was able to realise how imperfect was the excavation,

for in spite of all that had been done during thirty years there did not appear to be any open space exposed, for what was dug out in one spot was cast down in another. If, as he said, so much has been discovered by digging blindly (*en fouillant à l'aveugle*), it was not difficult to imagine what would be produced by methodical search. Then he mentions the statues of divinities and emperors which had been obtained, and he particularly remarked statues of the entire family of NONIUS BALBUS, which were found in one place, a family of great interest in the history of ancient art, for some of the masterpieces which were prized in Rome once belonged to them.

The discovery of the statues of the NONIA family had an unexpected effect. The Austrian Viceroy considered his master was being deprived of treasures. He therefore not only put a stop to the exploration, but demanded of the Prince D'ELBŒUF all the works of art he had taken from the subterranean city. A few years afterwards Naples obtained a new monarch. He decided to erect a palace at Portici, and ancient Herculaneum was relied on to furnish the means of its adornment. Colonel ALCUBIERRE, an officer of engineers, was appointed architect. He treated the remains with as little mercy as if they were obstacles in a campaign and his subordinates were pioneers. He succeeded, however, in revealing a theatre which at first was thought to be a temple. The news of the discovery was heard with surprise throughout Europe, and many archæologists travelled to Naples in order to see the new wonders. But the officials of the Neapolitan Government looked on the discoveries as if they were monopolies from which profit in some form or another was sure to be derived; and in consequence the advice of experts which might have been obtained gratuitously was withheld. Any further work attempted was continued in the old unsystematic manner.

The spirit which animated the Neapolitans, and which remains unchanged, can be judged from their conduct to WINCKELMANN. He was a German, but he had become an abbé and was an official of the Roman Court. He was recognised as the foremost authority on ancient art. He went to Naples and obtained permission to visit Herculaneum, but he was never allowed to go about without some agents. He made a second visit a few years afterwards, and wrote a book on the antiquities. His intentions could by an impartial critic be understood from the pages, yet when he went again to the ruins he was not accorded uninterrupted liberty in walking, for fear he was measuring the old city, and care was taken to conceal the latest discoveries from him. The King of NAPLES had, in fact, given orders that an official description of Herculaneum was to be published. The commission was given to BEYARDI. But as the introduction, which treated mainly of mythology, occupied about five volumes, the order was given to BERNARDO TENUCCI, one of the royal secretaries, and forty years elapsed before the completion of the work.

The discovery of Pompeii in 1748 and the comparative ease with which the buildings were cleared could not fail to have an effect on the excavations at Herculaneum. For about forty years they were continued with occasional intervals. But as only a few excavators could be employed the progress was slow. In 1828 the exploration was resumed and continued for about ten years. In 1866 another effort was made, but the results were unsatisfactory, and for several years it was believed either that Herculaneum was exhausted as a treasury of ancient art, or that the risks to the people living in the modern town were too great to be accepted. It requires therefore a large amount of courage in those who will accept responsibility for the proposed operations, and the whole civilised world must follow their efforts with unceasing interest. Herculaneum is to archæologists what the North Pole is to seamen. Difficult as the task is found to be in both cases, it cannot be said to be impossible.

We cannot expect that by any labour Herculaneum

will become as familiar as Pompeii. The mass of material above the old city, and the covering of streets and buildings by volcanic mud, *lava bavosa*, in a fluid state, will not allow such wholesale clearances to be accomplished as those in Pompeii. On the other hand, Herculaneum seems to have possessed a residential population who were there throughout the year, while Pompeii was for many merely a holiday or temporary resort. There was consequently a higher style of art in Herculaneum. DE BROSSES was amazed with the wall-paintings he saw, although he was familiar with the examples preserved in Rome. The President of the Royal Academy says that he knows of no work which affords such an impression of mastery over material as *Telephus Fed by the Hind*. DE BROSSES considered the *Theseus* found in Herculaneum surpassed *The Aldobrandini Marriage* in the grandeur of the figures and the skill in grouping. The sculpture is by many regarded as even more important than the paintings. The portrait statue of AESCHINES was greatly admired by CANOVA. The *Homer* is a most interesting type and evidence of the belief that when old he was poor. The fragments of the quadriga of NERO suggest that if it were not for the carelessness of ALCUBIERRE, who neglected to collect all that survived, the work would be unique. The *Mercury* is almost unsurpassed among ancient works of art. But it would require a long list to exhaust the masterpieces which Herculaneum has yielded. The discovery of Dr. HAYTER in 1802, when, aided by a sum of 1,200*l.*, he was enabled to unroll some of the manuscript rolls found in Herculaneum, suggests the culture prevalent in the ancient city. They were found several years before, but their value was unknown until it was discovered, through the efforts of Dr. HAYTER, that they were the works of some of the great philosophers. If they could have been brought to England there is no doubt more use would have been made of them. But their removal was prohibited by the King of NAPLES. Then most of them fell into the hands of the French, and only a few reached England. Whatever may have been the literary value of the manuscripts, the fact that such a large number were found in one house must compel all scholars to anticipate similar discoveries in the course of the forthcoming excavations.

One of the difficulties of the excavations has been the absence of adequate light. At such a depth torches cannot afford clear illumination. Those who take part in future excavations will not be handicapped by obscurity. There are also appliances of several kinds which are used in tunnelling, and may serve. The task will, however, continue to be onerous, for it will be still impossible to decide what is concealed by the hardened mud, and everything which is met with will have to be treated delicately. Progress must therefore be slow, and it will be necessary for the administration to be aided by more money than Italy can afford to give. Herculaneum has, however, interest for all men, and assistance will, no doubt, be sent in proportions befitting the occasion.

NEW BOOKS.

THE large volume on plastering published by Mr. BATSFORD was so exceptionally cheap, there was reason for supposing it was to be unique. But "Modern Practical Carpentry," by Mr. GEORGE ELLIS, which comes from the same publisher, is no less remarkable as a token of enterprise. In some respects it is a greater surprise. To have 1,100 illustrations, the majority of them being detailed, with about 400 pages of text, is enough to convince those who have absurd ideas concerning publishers' profits that in one important class of books the gains can only be of a modest kind. It is true that all the illustrations have not been expressly designed for the volume, but their value is not in the least diminished because some readers may have seen them before. Indeed, with an art like carpentry we

cannot expect much novelty. When the carpenters of Paris by their disputes compelled architects to substitute iron and concrete in flooring, timber construction was deprived of the possibilities of progress, for the new materials were found to be no less adapted for other kinds of construction. In many cases where carpentry could be utilised with advantage it has been superseded by iron or steel girders, and its range is therefore at present rather limited. It is consequently inevitable that, large as is the volume and numerous as are the illustrations, there are few inventive examples. The Vauxhall temporary bridge shows framing that differs little from the representations given to us of the Roman bridges. This peculiarity of carpentry has, however, an advantage, for a student can feel he is able to grasp its possibilities by attentive study. We may also say that if he masters Mr. ELLIS's volume he can overcome all the difficulties of construction which he is ever likely to meet. As a rule there is small scope for shaping material in carpentry, and what is most desirable is the ability to make suitable joints. Yet we find in the reports of the examinations throughout the country by the City and Guilds of London Institute that "the construction questions—viz. those on joints—were answered badly." In other words, teachers have neglected to make students acquainted with the most essential part of timber construction. In the new volume joints are treated with fitting importance. The work will be useful to those who design buildings as well as to workmen who have to follow drawings. All the ordinary varieties of carpentry are explained in a clear and practical style.

Many architects endeavour to become members of the Surveyors' Institution, for they are aware that with men of business the letters F.S.I. have almost equal value with those relating to the Institution of Civil Engineers. It is possible that in the examinations other subjects besides farm buildings will have to be considered. "Practical Farming," by Mr. E. T. SHEPHERD (London: CROSBY LOCKWOOD & SON) is the title of a handbook prepared for the examinations. The author has consulted the works of many writers, and the information is presented very clearly and succinctly. There is also a chapter on farm buildings. It appears to be well-adapted to serve the object proposed.

Cottages at the present time are a favourite subject with architects. "Country Cottages and Week-End Homes," by Mr. J. H. ELDER-DUNCAN (London: CASSELL & Co.) is a collection in quarto size of plans, drawings and photographs of cottages costing from 200*l.* to 3,500*l.* Numerous architects have contributed; there is consequently much variety, and clients must be difficult to please who are unable to find in the pages some building which approximates to their ideas. In the majority of instances the cost is given, in others it can be obtained on application. It is the kind of book which should appeal to Anglophiles on the Continent as well as to Americans. "Inexpensive Rural Cottages and Buildings for Small Holdings," by Mr. S. TAYLOR, F.S.I., comes from the office of the *Land Agents' Record*. The buildings are intended for labourers, workmen and for erection on small holdings. According to the author, they are unpretentious in appearance, inexpensive to erect and maintain, and adapted to meet the requirements of a large proportion of the country. The information is so ample it would not be difficult for any intelligent owner to have most of the buildings erected under his own superintendence. Mr. C. H. B. QUENNEL'S "Modern Suburban Houses" (B. T. BATSFORD) is described by him as "intended primarily for architects, builders and others interested in the development of building estates; it represents work done in recent years with a certain amount of success from the business point of view, and it is hoped that it will be more convincing than a series of suggestions or designs which have not been carried out. All the houses illustrated have been built on regulation building plots of varying width; they have been

built for sale, and they have all been sold." It would be fortunate if houses like those represented were found more often in the suburbs of London and of provincial towns. The exteriors, from the largeness of the windows and simplicity of parts, suggest spaciousness, and the oak paling is an approach to ruralism. The walls are of brickwork or brickwork and rough-cast, and there is a wise avoidance of cheap ornamentation. The majority of the houses have been erected at Hampstead, and they look equally well when seen apart or in groups.

The examples in the fourth volume of Mr. MIDDLETON's work on "Modern Buildings: their Planning, Construction and Equipment" (The Caxton Publishing Company), comprise public libraries, baths, small municipal buildings, law courts and large municipal buildings as exemplified in modern practice. The second portion consists of a treatise on steel construction by Mr. P. R. STRONG. This is a valuable feature of the work, and it includes among the diagrams copies of working drawings used for the Ritz Hotel. Mr. H. Y. MARGARY writes on wooden beams and pillars, and Mr. STRONG on fire-resisting construction. It will be evident that no pains have been spared to render the work comprehensive as a treatise on building construction.

To his cathedral series Mr. T. WERNER LAURIE has added a volume on "The Cathedrals of Northern Spain," by Mr. CHARLES RUDY, of Madrid. The author looks at things from his own standpoint, and in consequence the pages often contain statements which may at first appear startling. For instance, he says the Inquisition was not directed against the Reformation. Christianity flattered the Spaniard by placing him on an equal footing with all men. "The charm of Catholicism," we are told, "was that it enabled him to adore a local deity in the shape of a martyred saint. Thus it flattered his vanity as a clansman and his spirit of individualism." The only art for which the Spaniard seems to have capacity is music. To beauty in the plastic arts and architecture Mr. RUDY maintains he is cold and indifferent, and it is the same to him whether a cathedral is Gothic or Romanesque—all is architecture. There is consequently no pure Gothic, Romanesque or Renaissance building in the Peninsula. But the interior treasures are numerous. "The Spanish cathedral is for the foreigner a museum, a collection of art objects, pertaining most of them to the country's industrial arts, for which Iberia was first among all nations." Mr. RUDY awards deserved praise to the smiths for the *refjas* or grilles. They still seem unable to produce a bad example. The author describes thirty cathedrals existing in the northern provinces, and photographs are given of the exteriors. Mr. RUDY does not enter into the detail which we find in the late Mr. STREET's volume, for his book is intended for the use of ordinary travellers, and as much information is given about each building as is likely to be required. No Englishman should visit Northern Spain without this guide-book.

Some of the American engineering journals have succeeded in lettering and figuring their drawings with a perfection that is remarkable. In showing steel roofs, braced girders or columns they give not only the dimensions of each part, but the calculations which decided their adoption. However numerous may be the letters or figures, there is uniformity among those which are allied, and in that way the reading of a drawing becomes more simplified than might be thought possible. Mr. C. W. REINHARDT, the chief draughtsman of the *Engineering News*, has published a treatise on "Lettering" (A. CONSTABLE & Co.), in which he describes the system he adopts. The basis is a one-stroke style, which may be described as small or lower-case block or Egyptian. It does not correspond with the ordinary "stump" or italic which is familiar in this country, for there is no contrast of thick and thin lines, all the parts being uniform. The letters can be either upright or sloping. Perfection in it is much

more easily attained than with italic lettering, and words and dimensions are, however small the scale, more legible. Reproductions are also more successful when the letters are of uniform thickness. A large American work is about to be issued which also exemplifies American practice. It is entitled "Working Details," and is drawn and published by Mr. FRANK M. SNYDER, architect, New York; the English agents are the Technical Journals, Ltd. It resembles to some extent the collection of plates by JOBBINS, known as "Laxton's Examples." But the detail is more elaborated than was necessary in England. Each page measures 22 inches by 16 inches. The originals were coloured, but every page has a key explaining the hatching adopted to distinguish materials. In the specimen number there are ten plates by Messrs. McKIM, MEAD & WHITE, and other architects. As the subjects are mainly window-frames and door-frames a comparison between the different methods becomes easy. The American architects evidently do not trust a contractor's scaling, for dimensions are figured whenever there is a possibility of any being required.

"Crematoria in Great Britain and Abroad," by Mr. A. C. FREEMAN (London: St. Bride's Press, Ltd.), would be interesting if it were only as showing how a modern problem or a revival of one that was ancient presents itself to different minds. Nobody would have objected if for the crematoria established styles were ignored, and attempts were made to introduce novel forms, or to show the possibility of new and expressive styles. But practically we only have the familiar Italian and Gothic types, as if nineteenth-century imagination dare not escape from thralldom. The structures vary from temples to churches, and, indeed, in some of the English examples we see the familiar cemetery chapel with an ordinary tower to enclose the upcast shafts. We suppose people's minds are not as yet sufficiently emancipated from old associations to adopt an arrangement which would be suggestive of the vanishing of all that gave form and motion to human beings. Mr. FREEMAN presents a sufficient number of views and descriptions which testify that if novelty of design is not apparent, cremation has been adopted in many important cities on the Continent and in America.

After sixteen years a second edition of Mr. G. H. BLAGROVE's "Dangerous Structures and How to Deal with Them" (B. T. BATSFORD) has become necessary. In the interval authorities have become more exacting, and, indeed, there is very little choice left to any property-owners in the Metropolis whose buildings are declared to be dangerous. Prevention is better than cure, and Mr. BLAGROVE suggests how by timely reparation a building may be temporarily saved from condemnation. The origins of most varieties of defects are explained, and the book therefore is a supplement to a treatise on building, and its utility is undoubted.

The very cheap series of technical instruction volumes edited by Mr. P. N. HASLUCK (CASSELL & Co.) has been increased by treatises on "Sanitary Construction and Building" and "Sanitary Conveniences," by Mr. H. G. WHYATT, borough engineer of Grimsby, and one on "Iron, Steel and Fireproof Construction," by Mr. S. G. N. MANN. They are models of cheapness, and contain a surprising amount of information. There are occasional omissions which will no doubt be filled up in future editions.

The Town Hall Committee of Walsall Corporation have reported that the town clerk has been instructed to defend an action brought by Messrs. Armitage & Hodgson, of Leeds, the contractors for the new municipal buildings, claiming 2,846*l.*, an amount which had been in dispute, the committee contending that the architect had not been authorised to order the work to be done, and that they had a counterclaim for non-completion of the contract within the specified time. If necessary the committee authorised proceedings to recover from the architect all costs, damages and expenses the Council may incur.

THE ISLE OF THE SAINTS.

A LITTLE way off the south-east coast of Mull, nearly opposite Loch Buie, lies a small group of islands, barren and desolate in appearance, offering no obvious attraction to the tourist hurrying past in search of better-known objects of interest. Yet to those who know about them, these rocky islets are almost as much to be revered as the sacred soil of Iona. These are the Garveloch Isles, on the most southerly of which, the Eilean na Naomh, or Island of the Saints, are the remains of the only beehive cells now existing in Scotland. Even to the antiquarian they are often only a name, owing to the difficulty of landing on their inhospitable shores. The prevailing south-west wind with its accompanying swell makes it frequently impossible safely to get close to the islands; and even when this is accomplished, it is no easy matter to gain a footing on the slippery rocks that shelve away straight to the water's edge.

Here, then, we landed, says a correspondent of the *Glasgow Herald*, pilgrims of the twentieth century, to gaze on the relics of the sixth, and to marvel at their state of preservation after being for 1,400 years buffeted by the storms and lashed by the rains of the Western seas. The ruins of the settlement cover a good deal of ground, and are situated in a sheltered hollow on the eastern side of the island. A short distance up from the shore can be traced the remains of the wall surrounding the burial-place, and inside this is one stone at least with the incised cross still quite distinct. Near by is another enclosure with portions of ancient buildings, which were probably the dwellings of the monks, and just beside these is the chapel, strongly built of unmortared slabs of slate. Outside its wall lies the only sculptured stone to be seen, a large flat one like those at Iona, well covered with a beautiful leaf design. A little higher up than the chapel is another small building, which might have been the cell of the abbot, and on the slope leading down again to the shore are two beehive cells. They are wonderfully perfect, and it is quite easy to see their proportions and manner of building, thanks, no doubt, to the solitude and inaccessibility of the islands, which have saved these ruins from being used as a quarry, as so many others have been. The stones, like those of the chapel, are laid on each other without any mortar, but so skilfully that the rounded form of the cell is still preserved after all these centuries. The two cells are joined together by a low passage, which is probably lower now than it was originally, owing to the ground having risen round it. The peculiar interest of these ruins lies in the fact that they are the only buildings of the age of Columba now existing, and give a very good idea of what the plan of the monastery of Iona must have been, though the original buildings there were made of wood and wattles, and so have entirely disappeared. The monastery on Hinba is believed to have been the first founded after Iona, and Columba himself had a cell there, though it cannot be identified with any of those we have described. From passages in Adamnan's narrative it seems to have stood on higher ground than the monastery, and possibly being more exposed has more quickly fallen into decay. The settlement, according to Skene, "seems to have been especially connected with the penitential discipline of the order, and a place of retirement for those who wished to lead a more solitary life. Thus we find Columba on one occasion visiting Hinba, and ordering that the penitents should enjoy some indulgence in respect of food, which one of the penitents in that place, a certain Neman, refused to accept." I am afraid there are not many among us nowadays who would wish for a more solitary life than that of Iona, or in any case who would not thankfully grasp at any "indulgence" in diet or penance.

On a knoll above the landing-place, and overlooking the monastery, is a small enclosure of rough stones, within which are two upright slabs of slate, standing as if marking the head and foot of a grave, on one of which is an incised cross. Skene makes no mention of this, unless we are to identify it with "an elevated piece of level ground where the fragments of a cross were found," which is supposed to be the spot on which Ernan, the head of the monastery and uncle to Columba, died. Local tradition, however, asserts that this enclosure is the burial-place of the mother of St. Columba, which makes it very interesting. Being quite apart from the ordinary burying-ground of the monastery seems to mark it as the grave of some one of importance; besides which it is improbable that in any case a woman would be buried within the monastery bounds, even though she were the mother of the founder. One could not easily

find a more peaceful spot for one's dust to rest in, all its associations being hallowed by the thoughts of the pious recluses who sought a retreat there, and there is a dignity and pathos about the little enclosure, with its simple cross, that appeals to the imagination. It seems as if those who have strenuously lived and worked in any place left the impression of their thoughts and ideals behind them, and in the atmosphere of Hinba and Iona surely something lingers of the mystic purity and spirituality of the souls who sought a refuge there long ago from "the world, the flesh and the devil." In these days of feverish haste and "crowded life" it is good to turn aside to such haunts of peaceful memory, where the relics of the deathless past speak to us "things unutterable" that go to our "soul's soul."

THE CHURCH OF SAN CLEMENTE.

ALL visitors to the Eternal City know San Clemente—the beautiful basilica not far from the Colosseum, whose curious frescoes are among the sights of Rome, whose equally curious history goes back to the early days of Christianity, when Clement was accounted among the "fellow labourers" of St. Paul, and rose to be the third successor of St. Peter. But for more than thirty years, says the Rome correspondent of the *Morning Post*, no one has set foot in the oldest and lowest part of the building, the portion which lies beneath the two successive churches. Among the last persons who descended into that now impenetrable recess were King Edward VII. and Queen Alexandra, then Prince and Princess of Wales, whose visit is commemorated by two photographs, one presented by them and dated 1872, the other representing the late Father Mullooly in the act of showing them the place. Shortly afterwards water began to enter the chambers at the base of San Clemente. The municipal drainage scheme for the adjacent Via di San Giovanni had failed to take into account the fact that the lowest part of that edifice lay at a considerable distance beneath the level of the drain pipes. Accordingly the water rapidly covered the basement, as it also covered the substructures of the low-lying Colosseum, and, while the latter was speedily drained, the basilica has ever since remained standing in several feet of water, more in winter, less in the dry summer months.

Now, at last, a scheme has been prepared by Mr. C. A. Mills, an English gentleman resident in Rome, for the drainage of the church at a cost of about 1,500*l.* by means of pipes laid some 30 feet or 40 feet below the road and connecting with the municipal drainage near the Colosseum. The municipality has approved the scheme; two committees, one of residents in Rome, the other of various distinguished persons in the British Empire and America, have been formed, and people of all religious opinions have consented to join in a work which promises to be of the greatest archaeological importance.

The Pope has bestowed a warm encomium on this proposal to rescue the substructures of the church from destruction—for they are of tufa and are being gradually affected by the action of the water—and to make the oratory and house of the saint once more accessible to the public. Anglicans and others are anxious for the recovery of this valuable fragment of Early Christian life and for the preservation of the frescoes in the second church, on which the damp is having a gradual but fatal influence. Archaeologists are desirous of seeing what King Edward VII. was almost the last to see—the now submerged Temple of Mithras, established perhaps in the desecrated oratory of Clement after his exile, a shrine larger than that at Ostia, and one which still has the altar and the statue of the god in their original places, just as they were discovered by the late Father Mullooly in 1860. There, too, are portions of an ancient wall, possibly that of Servius Tullius, one of whose gates, the Porta Querquetulana, mentioned by the Elder Pliny, is known to have been situated between the Esquiline and the Cælian, of which Querquetulanus was an older name. Thus the Rome of the kings and of the emperors, the worship of Christ and the cult of Mithras, the house of the noble Clement and the oratory where he prayed after his conversion, all meet at this subterranean spot.

The historic importance of San Clemente has been further increased by Mgr. Wilpert's recent investigations of the frescoes in the second church. That learned scholar has shown in a pamphlet published three months ago that Father Mullooly's surmises as to the subjects of some of the

dim paintings on the walls were inaccurate. He believes, for example, that in the two frescoes, which have hitherto been supposed to represent the Martyrdom of St. Catherine and the Council which Pope Zosimus held in this church in 417 for the condemnation of the Pelagian heresy, we have two-thirds of a magnificent Last Judgment, dating from the middle of the ninth century, and therefore two centuries older than the oldest known picture of that scene, that which is preserved on the island of Reichenau, in the Lake of Constance. Mgr. Wilpert asks, Who was the author of this fresco, and what did he copy? One may reply, May he not have been the famous Methodios, one of the two apostles of the Bulgarians, who, together with his companion Cyril, came to Rome at that very period, bearing the relics of San Clemente, exiled and martyred seven centuries earlier by Trajan on the shores of the stormy Euxine? We know that Methodios converted Prince Boris of Bulgaria to Christianity by means of a most realistic picture of the Day of Judgment which he set before the eyes of the terrified monarch. Is it not conceivable that this was the model and its artist the painter of the Last Judgment still to be seen at San Clemente? While San Clemente is closely connected with the conversion of the Bulgarians—an event which profoundly influences to this hour the politics of the Balkan Peninsula—it is also intimately associated with Ireland. When in 1873 the law for the suppression of religious houses passed the Italian Parliament the Irish Dominicans of San Clemente were able to show that they had been in possession of that edifice, together with San Sisto on the Via Appia, since the reign of Charles II. Accordingly San Clemente was spared, and a genial Irishman is still its rector.

THE MILAN EXHIBITION.

THE following awards for engravings, etchings and lithographs have been given in the decorative arts court of the British section at the above exhibition:—

Grand Prix.—“Collectivity” of the International Society of Sculptors, Painters and Gravers.

Separate awards received by members of the I.S. of S.P.G. exhibiting in the “Collectivity”:—Diplôme d'Honneur.—Sir Charles Holroyd, A. Legros, Joseph Pennell. Gold Medal.—Sidney Lee, Frank Mura, A. W. Seaby. Silver Medal.—Morley Fletcher, Oliver Hall, A. S. Hartrick, L. H. Shannon, E. J. Sullivan. Bronze Medal.—H. M. Livens.

Separate awards received by other artists exhibiting with the Society in the above “Collectivity”:—Grand Prix.—F. Brangwyn, Lucien Pissarro. Diplôme d'Honneur.—Alfred East. Gold Medal.—E. S. Lawrenson, Arthur Rackham, Charles Ricketts. Silver Medal.—J. D. Batten, Ollson-Nordfelt. Bronze Medal.—Henry Becker. Hon. Mention.—Robert Spence.

The following awards have been bestowed on British exhibitors at the exhibition, exclusive of those in the scholastic court:—Grand prix, 99; diplomas of honour, 53; gold medals, 100; silver medals, 53; bronze medals, 20; honourable mention, 8. The general average for the whole exhibition was four awards to every five exhibitors, but this was exceeded in the British section, the average being 1.09 award per exhibitor.

TREATMENT OF STONEMWORK.

AT the last meeting of the Sheffield Society of Architects and Surveyors Mr. W. J. Hale read a paper on “The Architectural Treatment of Stonework.” It was explained that any treatment of materials, to be satisfactory, must take into account the nature, qualities and limitations of that material. The first thing, therefore, is to consider the composition and special characteristics of stone. The most common building stones found in the Sheffield district are sandstones. Limestone, which is also used to a less degree, consists practically of grains of silica or carbonate of lime, cemented together by a matrix of silica acid, or carbonate of lime, or carbonate of magnesia, and therefore depends for cohesion upon the power of the cementing material. Two characteristics which make stone useful as a building material are its weight and its power to resist a crushing force. One of the charms of stonework lies in its capacity to receive the impress of the individual man's power and thought. Its surface can be made to reflect his mind by the manual labour he expends upon it, and the monotony of a modelled and cast material is avoided. Although stone is granular it is generally more or less laminated, and care

should be taken to place the blocks in the building so that the edges only may be exposed to the weather, otherwise the stone will more easily decay and the surface peel off. Jointing should be carefully considered, acute angles avoided and right angles used where possible.

The arch utilises in its shape and design the prominent characteristics of stone, its weight and its power to resist crushing force, and the introduction of this feature caused one of the greatest changes in architecture. A further development of the arch is the groined or vaulted ceiling, which relies for stability upon the same qualities, and has also certain fire-resisting powers, the absence of which in the wooden roofs of the nave and choir of Selby Abbey we must all deplore. One method of beautifying the stone is by mouldings, i.e. the working of surfaces or edges of the stones with ridges and hollows of various forms, in order to obtain parallel lines of light and shadow, and, as variety is the object here, it is well to get variety also in the size of the light and dark strips.

One of the problems of the day with regard to architecture in stone is the modern street front. Surely the craze for carrying tons of stone on sheets of plate-glass has gone far enough. Any building, to be satisfactory, must not only have supports strong enough to carry the superimposed weight, but the supports must look strong enough for their burden. Any treatment of stone should in the first place be examined as to whether or not it takes advantage of the inherent qualities of the material, and secondly, as to whether it satisfies man's trained artistic perceptions. If it stands these tests, then, although the particular feature may not be capable of defence on strictly utilitarian grounds, still it has justified its existence.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE annual general meeting of the above Society was held at the Society's rooms on the 8th inst., when the secretary read the fortieth annual report of the Council.

The total membership on April 30, 1906, was 174—namely, 29 honorary members, 77 members and 68 Associates—as against a membership of 174 last year. During the year the following members have been elected:—Members: Messrs. G. A. Beaumont, F. E. P. Edwards and R. F. Farrar. Associates: Messrs. N. Fisher and C. Hardman.

During the year 1905-6 there have been nine general meetings and fourteen Council meetings. Mr. Oglesby resigned his office of hon. secretary to the Society on August 15, 1905, and the Council, in accepting his resignation, expressed their thanks for the efficient manner in which he had discharged the duties of the office.

The Society's silver medal and prize of five guineas given by the President for the best set of measured drawings was awarded to Mr. W. P. Rylatt. The prize of three guineas offered by the Society for sketching was given to Mr. W. P. Rylatt. The prize of three guineas offered by the Society for the best set of designs for subjects selected by the Council was awarded to Mr. H. Carnelly. The prize for construction, of three guineas, offered by the Society was awarded to Mr. W. P. Rylatt. The prize for an essay of two guineas offered by the Society was awarded to Mr. W. Whitehead. The Halden prize, of the value of four guineas, was awarded to Mr. W. Whitehead. The School of Architecture, under the auspices of the Society, in conjunction with the Leeds Institute and the Leeds University, is proving of great advantage to the Associates in preparing them in the subjects required for the R.I.B.A. examinations. In May the local Associates of the R.I.B.A. petitioned the Society to express to the R.I.B.A. their great indignation at the present large influx of members to the Royal Institute direct, which was supported by the Council and forwarded to the R.I.B.A.

Competitive Designs were recently obtained for the Jeppe High School, Johannesburg, and Johannesburg College. The awards are as follows:—1, design No. 4, Mr. John Ralston, Pretoria; 2, design No. 6, Messrs. Watt and partners, Pretoria; 3, design No. 19, Mr. E. C. Choinier, Johannesburg. Johannesburg College—1, design No. 8, Mr. John Ralston, Pretoria; 2, design No. 26, Messrs. W. Leck & F. Einley, Johannesburg; 3, design No. 39, Messrs. Macintosh & Moffat, Johannesburg.

LONDON'S NEW CONCERT HALL, GREAT PORTLAND STREET, W.

AS we have already announced, a successor to St. James's Hall is to be erected. The London County Council have granted the necessary certificate for its erection, the contractors have already cleared the site, and building operations have begun. The site secured for the purpose is that of the disused and now demolished St. Paul's Church, which occupied an "island" space in Great Portland Street, a few yards from Queen's Hall. St. Paul's Church was presented by the Duke of Devonshire to the State in 1764, and was erected on a site of the "Marylebone basin," which was a reservoir of water for the supply of that part of the Metropolis. As a place of worship St. Paul's has been deserted for the last two years, and Lord Howard de Walden bought the edifice from the Ecclesiastical Commissioners, thus purchasing what his ancestor had presented as a gift to the State. The main entrance to the new hall will be in Great Portland Street. The approach will lead through a large vestibule, on one side of which is the box office, on the other a cloak-room for men, a spacious smoking lounge and lavatory accommodation being provided underneath the vestibule. From the vestibule the main staircase will lead to a grand foyer on the first-floor level, from which doors open into the hall. The lower part of the walls of the entrance, vestibule, staircase and foyer will be lined with marble. A separate entrance and staircase lead from the Great Portland Street end of Gildea Street to the balcony, in addition to which there will be four exits from the hall at the end further from Great Portland Street, thus assuring ample means of entrance and egress. The hall will comprise two levels, the area or floor space seating about 600, and the balcony seating about 600, making a total of 1,200 seats, without reckoning the orchestra and platform at the end of the hall, which will accommodate a full-sized choir, and not including the space allotted to instrumentalists. At the back of the orchestra will be the organ. The orchestra is approached by two separate staircases, quite distinct from those leading to the hall itself. Retiring-rooms for artists, both men and ladies, and for the chorus adjoin these staircases. Caretaker's rooms and offices for management and staff are placed in the upper part of the building.

It need hardly be said that every effort is being made to render the acoustic properties of the hall as perfect as

possible. Special attention, too, is being paid to the questions of heating and ventilation, to insure that both the audience and the artists may rely on even temperature in all weathers, with no risk of draughts. The doors and internal fittings of the hall will be of mahogany, and copper is extensively introduced in the fittings and in the rail which protects the front of the balcony. The decorations will be found to differ considerably from those generally adopted in places of public entertainment. The treatment throughout is on simpler lines—plain panelling, with broadly treated mouldings taking the place of enrichments and ornamentations in relief on ceilings and walls. The hall will thus depend greatly for its effect on the colour scheme which is now being designed for it. The concert hall forms part of a scheme which provides for spacious show-rooms on the ground-floor fronting Great Portland Street and the adjoining Langham Street on the south. The exterior design of the building is Classic in detail; the frontages will be of brick with Portland stone dressings. The architects for the general scheme are Messrs. Joseph & Smith, 83 Queen Street, E.C. The architect specially retained by the promoters to advise as to the constructions, arrangements, fittings and decorations, and all other points of detail which have, in a building of this description to be specially considered, is Mr. Arthur Blomfield Jackson, 3 New Square, Lincoln's Inn, W.C., who was formerly in partnership with the late Mr. C. J. Phipps, who made the plans of the Queen's Hall, and with whom he was associated in the designing of His Majesty's Theatre. Since Mr. Phipps's death he has been engaged as architect in connection with many buildings of a public character, amongst which may be mentioned the following theatres, the work in some cases amounting practically to rebuilding, St. James's, Savoy, Shaftesbury, Lyric and Garrick.

A New Library is proposed to be erected at the Sheffield University. An octagonal skeleton has been put up to show the effect the contemplated building is likely to have on Weston Park, which adjoins. It is feared that some of the trees in the corner will have to come down on account of lighting requirements.

NOTES AND COMMENTS.

THREE weeks ago we referred to the dissatisfaction of the members of the Liverpool Academy at the manner of selection adopted by a committee for the exhibition at the Royal Institution. The style of painting which found approval was only supported by a minority of the members. The paintings to be seen are therefore not representative of the art of Liverpool as a whole. The selection committee was, however, elected by the members, and it could not therefore be considered as inspired by the views of outsiders. It cannot be said that the discontent has come to an end, for last week the following resolution was adopted by a majority of three:—"We consider that the members of the selection committee have by their wholesale rejections outraged the good feeling formerly existing amongst the members of the Academy, and have made the exhibition one which does not represent the general body of the members and associates."

THE invasion of the sea, although it is deplored, does not strike the public mind with sufficient force when the loss of land is confined to fields along the coast which are not always cultivated, and which it would be costly to make fertile. But when an important resort like Brighton is threatened, then the danger appeals to thousands. Rottingdean is close to Brighton, and a great many people walk or drive to it every year. For some time past the cliffs have been succumbing to the waves, and a great many tons of chalk fall. The authorities have two alternatives in dealing with the matter. They must either adopt a costly system of protection at the spot which appears to be most dangerous, or they must divert the road and leave the cliffs to their fate. Coast protection has of late years given rise to many forms of groin. The county surveyor for East Sussex considers that the OWEN-CASE system of ferro-concrete is best adapted for use at Rottingdean. Each groin would have to be 400 feet in length, and as it is proposed to place them about 500 feet apart, twelve would be required. As each is estimated to cost 354*l.* 10*s.*, the groins alone would amount to 4,254*l.* It is also recommended to give a batten of 1 in 6 to the cliffs, and that work would cost 3,000*l.* The engineer's fees and contingencies may be calculated at 746*l.*, making the total cost 8,000*l.* That is a large sum to be expended for the preservation of little over a mile of cliff. The subject was discussed on Tuesday, when it was found that there was a good deal of opposition. The battening of the cliff was thought unnecessary by some members, while others held that the number of groins should be largely increased. Eventually it was decided to refer the subject back to the committee, especially as it was expected that the Royal Commission might make some recommendations about constituting a special authority for dealing with the coast.

ILLUSTRATIONS.

THE LONDON COUNTY COUNCIL FIRE BRIGADE STATIONS,
BRIXTON AND HERNE HILL.

THE transformation which has taken place at Herne Hill during recent years is of a very remarkable character, and a notable addition to the new buildings which have sprung up in a neighbourhood, that within the memory of many now living was quite of a rural character, is the fine fire-brigade station situated at the lower end of Herne Hill, near to Half Moon Lane and contiguous to the South-Eastern and Chatham and Dover Railway Station. One side of the erection abuts upon the district postal sorting office, while a block of flats almost adjoins on the other side. It will be remembered that what was known as the Abbey stood close to the site formerly, and the house where JOHN RUSKIN lived for many years is but a few yards distant, while his name is perpetuated in connection with the narrow thoroughfare, formerly known as Love Lane, but now designated Ruskin Walk.

The other building, of a similar character, is situated in Gresham Road, Brixton, on a plot of land where once stood an iron church near to the railway line, and in a densely populated neighbourhood.

Both fire brigade stations were designed by and erected under the superintendence of the architect to the London County Council, Mr. W. E. RILEY. They are faced with Portland stone as regards the lower part, while the upper portion is of fine quality red bricks, and the roof is covered in with Welsh green slates.

HOUSE AT CHAPELTOWN, LEEDS.

CATHEDRAL SERIES.—MANCHESTER: SOUTH-EAST CORNER, SHOWING OLD CHAPTER-HOUSE.

THE earlier of the two chapter-houses of Manchester Cathedral was one of the works which RALPH LANGLEY had executed. He was appointed to the office of warden in the cathedral church in 1465, and he caused several important changes to be undertaken in the cathedral. The chapter-house is partly octagonal, and it is lighted by four windows. From its position the chapter-house was likely to have served as a sanctuary.

DETAILS OF OLD BEAUPRE, GLAMORGANSHIRE.

OLD Beaupré Castle, or Manor House, is situated about fifteen miles from Cardiff, in the south of Glamorganshire. The greater portion is in ruins, but the most interesting details are to be found in the beautiful porch and the entrance gateway shown on the accompanying drawing. There is an inscription on the porch which states that "RYCHARDE BASSETT, having to wyf KATHERINE, daughter to Sir THOMAS JOHNS, Knight, bwyllt this porch with the tonnes (wedding dowry) in Ano 1600. His yeres 65, his wyf 55." Over the centre of the entrance gateway is an inscription in Welsh, "Gwell-ang-ay-na-chwilydd, 1586." The porch is described in GWILT's Encyclopædia, and is three storeys in height. The house formerly belonged to the CECILS, but has been in the possession of the BASSETTS for a great number of years. A portion of the buildings, consisting of about half a dozen rooms, are occupied by a farmer, who acts as caretaker, but the remainder of the buildings are in a ruinous state.

BURFORD PRIORY, OXON.

A SMALL priory or hospital existed at Burford as early as 1291, but it was rebuilt in the reign of King HENRY VIII. by HARMAN, the king's barber. It then passed into the hands of Sir LAWRENCE TANFIELD, who built a handsome and commodious residence in the Elizabethan style, occupying more than twice the space of the present building, but a small portion of the earlier edifice built by HARMAN was allowed to remain. After Sir LAWRENCE TANFIELD died it belonged to the LENTHALLS, who lived there from 1636 to 1808. The building was again altered and enlarged in 1808. Sir LAWRENCE TANFIELD, knight, was at one time Lord Chief Justice, and in Burford Church is a beautiful monument erected to his memory. The building is not at present occupied, except by a caretaker, most of the floors being missing, and some portions of the plaster ceilings, which are of beautiful design, having fallen down. The chapel is of the most peculiar design, the windows being filled in with tracery, but the detail and mouldings are Classic. The arcade shown in the drawing leads from the reception-room to the chapel, and the flat roof over was used as a private way for the family from the ball-room on the first floor to the gallery. The drawing is by Mr. W. EATON, A.R.I.B.A.

THE building containing the London and County Bank, St. James's Street, S.W., of which an illustration appeared last week, is known as "Connaught House." The bank premises on the ground floor, as shown in our illustration, were designed and carried out by Messrs. THOMPSON & WALFORD, of Leadenhall Buildings, E.C., the bank architects.

THE SOCIETY OF ARCHITECTS.*

I GREET you for the second year in succession on being elected by your unanimous vote to fill the highest office in the Society. I appreciate to the fullest extent the compliment implied and the honour which you have conferred upon me. Looking forward with certainty to your active co-operation in the interests of the Society, I anticipate that the forthcoming year will be one of pleasure and profit to all concerned. We as a Society are essentially a progressive body; not content with a mere existence, we are constantly developing and continually growing in numbers and influence, so that every year brings greater responsibilities to those charged with the administration of our affairs. The annual report is still fresh in our memories, and I need not therefore be retrospective; rather I would endeavour to show in what directions we may in my opinion still further extend the sphere of utility of our Society. It is very possible that my views, which are of course personal and are not intended to bind the Council in any way, may not meet with universal approval, but those who do not agree with me will at any rate feel that these views are put forward with a genuine desire for the welfare of the Society and with a view of inviting criticism. If you do not like my proposals, have you anything better to suggest? That is the test, and that is what I want—to get at something which shall help us as a Society, not only to benefit ourselves, but in some measure the general body of practitioners and the community also.

The Need for Wider Representation.

In the first place, it is obvious to me that, gratifying as our rapid growth in membership has been, we ought to be in a much greater degree representative of those whose interests we seek to serve, if we are to use to their fullest extent those powers conferred upon us by our incorporation, and which are extremely far-reaching. That there is a very large field for our operations in this direction is shown by the fact that a comparatively small proportion of the architects of the United Kingdom are attached to any architectural body, though the majority of them are, it is understood, in favour of some form of registration or federation—that is, the binding of themselves together for the advancement of their art and for mutual support and assistance.

We have recently set our house in order by so revising our articles of association as to place us in a position for dealing with schemes of development in many directions, and it should not be difficult to evolve some plan which would result in placing the Society in the forefront on this question of representation. This, of course, cannot be done without considerable expenditure of time and money. We have during the last few years been liberal in our donations to deserving objects and institutions outside, yet within the scope of our Society, our contributions amounting to several hundreds of pounds. I venture to suggest that we should for a time, while not losing sight of obligations in the directions indicated, devote whatever reasonable sum may be necessary in extending and consolidating the Society itself, with a view to materially extending the benefits of membership and of attracting to our ranks those who so far have held aloof from any architectural institution.

We have to remember that there are two sides to the question of membership in a society, viz. how it will benefit a member and how a member can benefit a society. It is naturally the first question which appeals most strongly to a potential member when it comes to the point, and we must be in a position to emphasise the fact, that not only does every fresh adherent bring us one step nearer to the realisation of our ambitions as regards federation, but that such adherent will himself secure certain privileges.

Affiliation with a properly constituted body such as ours, is in itself of value, seeing that a member thereby becomes one of a corporate body possessed of powers collectively, which can be utilised in the interests of a single member, but which he individually and alone is unable to exercise. This, however, to the popular mind, is a more or less abstract privilege, and does not appeal to a candidate in the same degree as tangible advantages, such as the prestige of affiliation with a Society with a membership running into thousands, permanent and convenient headquarters, a good loan library and other privileges which will occur to you.

The principle which should guide us in formulating some comprehensive scheme is, I think, to be found in the

Registration Bill which we are promoting. There it is provided that persons who can prove certain qualifications are entitled to be thereby recognised as architects, and presumably, therefore, fit for membership in any institution or body of architects, presuming, of course, that the qualifications required of him under the Bill are such as would admit of this.

Let us apply this principle to ourselves. Here we have a Society whose regulations set forth that persons possessing certain qualifications are eligible for membership, subject to the approval of the governing body, and after that to the exigencies of the members' ballot. I think we ought, first of all, to take steps to make these regulations and the work of the Society known to such as are fully qualified, and to cordially invite their co-operation in its work by becoming members. Do not let me be misunderstood. I am not advocating the throwing open of the Society's doors to all and sundry, but I say distinctly, if a man is qualified by our rules, and of good standing with members in his district, we are not fulfilling our duty if we do not at least give him an opportunity of becoming acquainted with our objects with a view to securing his adherence.

It is extremely probable that there are many unattached architects of good standing and reputation among their fellow men who would be glad to give their adherence to our Society were an invitation extended to them, and I cannot see anything derogatory in such a course. We are founded for certain specific purposes which cannot be fulfilled unless we secure the support of all those who are qualified for membership. If, for instance, we are to make any practical progress with registration (to take only one subject) we must have at our back the united force of a large majority of the profession expressed in membership of the Society, and not merely an expression of friendly support from gentlemen sitting on the fence. My proposal, to put it briefly, is that pending statutory registration we should take steps to enlarge our borders so as to become, by force of numbers, the recognised registering body for the profession. I hope my remarks may not be misconstrued; my meaning is, that whilst our Council should continue to exercise due vigilance and discretion as in the past in admitting members, we ought also to use every legitimate means in our power to extend our membership. This is where the ordinary member's opportunity comes in of doing practical service to the Society by his personal influence.

It is a very encouraging sign when members in far distant lands adopt in a practical manner the principles of federation under local government, and band themselves together with a view of promoting the interests of their Society in the locality concerned. This is what has happened in South Africa, where a branch of the Society has been formed, with a centre at Johannesburg, which has had powers delegated to it sufficiently wide to admit of its rendering the Society and the profession locally the utmost service.

There is hardly a corner of the Empire where architects foregather but you find amongst them a member of the Society, and there is little doubt that, as time goes on, the good example set by Johannesburg will spread to other parts of South Africa, and from there to further parts of the Empire and distant lands.

The Society of Architects has outgrown the expectation of its original promoters, and it is a pleasant reflection that where legislation has been required to benefit the members of our profession this Society, ever since it came into existence, has been foremost in every progressive movement.

In my opinion the time has arrived for us to seriously consider the desirability of making application for a charter as well as altering our style and title, and, under certain reservations, making examination obligatory as a qualification for membership.

I sincerely hope that all the members of the Society may be disposed to favour development on these lines, and be prepared to use their best endeavours in conducting and carrying through the necessary details.

My earnest wish is that our Society will do all in its power to more unite our members throughout the British Empire, and that at no distant date it may take its place, by favour of His Most Excellent Majesty King Edward VII., among the Royal Societies of the United Kingdom. This would probably meet with the approval of our members practising in the United Kingdom as well as of those in the British Dominions beyond the seas.

Registration.

Continued effort on definite lines must bring success. Keep to the path, do not be led away by side issues.

* Presidential address delivered by Mr. A. E. Pridmore on the 15th inst.

Remember that no scheme of registration which does not embrace the whole profession will be of the slightest use.

A proposal which has for its basis the restriction of Parliamentary powers to any single institution cannot, under the present condition of things, have the least chance of securing the approval of Parliament, which, in my opinion, would not grant a monopoly, whereas the principle expressed in the Society's Bill is one which, I venture to say, would meet with general approval. Now, as ever, the opposition, so far as our Society is concerned, is from within the profession and is confined principally to questions of detail. The principle has long been admitted and acted upon by all concerned, and while there always will be differences of opinion on minor matters, it is satisfactory to feel that much of the old misunderstanding has been lived down, and there appears to be every prospect of further favourable development in the future. In the meantime, it only remains for us to go on with our Bill.

The Coming Generation.

An important part of the Society's work is its sphere of utility to the younger members of the profession, and it is common on such occasions as the present to paint in more or less glowing colours an attractive picture of architecture as a profession, and to endeavour to inculcate high ideals and aims in the minds of those who are on the threshold of their career.

I thoroughly sympathise with those who by such means seek to uphold the traditions of a great profession, but I think it would be much kinder to the rising generation to plainly point out that under the present want of system the profession is overcrowded to such a degree that many able men find it extremely difficult to make a living, and I should strongly advise parents or guardians to think twice before launching their sons or daughters into it. Unless persons have a special aptitude for the work, it would be much better for all concerned that they should turn their attention to some other calling where their abilities would have wider scope and more hope of reward.

I know of course that in theory "artists" are or are supposed to be above such petty considerations as money matters, and that no one should enter the profession of architecture unless impelled thereto by the love of his art; but we have to take things as they are, and it is undoubtedly a fact that a very large majority of persons enter the profession with the same honourable object as they would take up any other calling, viz. the making of a livelihood.

While persons continue to flock into the profession as at present, so long there will be a wide field for an institution which will cater for their special needs, and it should be for us to consider and formulate some comprehensive scheme for meeting them.

We have already done something in the institution of valuable studentships and scholarships, and a circulating technical library, but a very great deal remains to be accomplished before we can hope to do more than touch the fringe of that large field which should form a valuable "feeder" to the Society.

Qualification by Examination.

In connection with this, I might refer to our qualifying examination for membership, the requirements of which are of so high a standard that, although we get very many inquiries for the syllabus, comparatively few find themselves able to take the examination without some years of careful preparation, and a still smaller proportion succeed in satisfying the examiners at one sitting, while many are relegated wholly.

Where, as in our profession, tests of proficiency are voluntary, and are not essential as a qualification to practice, there is very little inducement beyond the stimulus of self-improvement for a candidate to sit for an examination which, whether at the Institute or the Society, is merely a qualification for membership. The latter, under certain conditions and limitations, is also obtainable by other means, and until registration is accomplished, and a test of some kind is compulsory on all who propose to practice, there will always be those who will not trouble to sit for a voluntary test, or who, having done so and been relegated, will not proceed further, but are content to commence practice with very little training. The consequence is the profession is crowded with mediocrity and the properly qualified man has to suffer accordingly.

Here, again, is an opportunity for us. Let us in this, as in the membership question, actively adopt the principle of our Registration Bill, and devise some wide system which

will ultimately result in attracting every architectural student to the Society's examination as a matter of course. Possibly some scheme of graded certificates of proficiency issued under the auspices of the Society would prove of value; indeed, the Council have before them at the moment a proposition by the secretary the principle of which they have adopted, and which, when the details are worked out, will probably be found to solve to some extent our difficulties in dealing with this important problem. Here again, our members have an opportunity of forwarding the interests of the Society in a practical manner by encouraging and giving their pupils and assistants, as a matter of course, an opportunity of availing themselves of such privileges as the Society is able to offer.

Sociability a Factor in Architecture.

Before leaving our Society's affairs to touch briefly upon matters of wider interest, I would like to insist upon one aspect which to my mind is somewhat overlooked. I refer to the question of sociability as a factor in architecture.

The ordinary meetings, while pleasant enough in their way, are necessarily, or I would rather say unnecessarily, stiff and ceremonious, and while we may go away from them edified and instructed, we are not as members of a Society, brought very much nearer to each other in the bonds of acquaintance or friendship. The time for mutual intercourse is brief, and we have no opportunity for getting to really know each other.

I think much of the distrust and apathy which undoubtedly prevails in the profession is due to our insularity, and it is a matter of common experience that a closer acquaintance with our fellow men usually results to our profit in many ways; for instance, the friendly exchange of ideas and experience on points of practice is most helpful.

In the States I understand that the periodical gatherings of members of the various architectural societies, or "chapters," as they are called, are frequently preceded or followed by a social function, and that with no loss of dignity or efficiency; in fact, it has been found that the attendance at the meetings has largely increased where provision has been made for mind and body at the same time.

Meetings in this country are generally held about 8 P.M., with the result that when a man closes down for the day he has usually a couple of hours or so to put in somehow and somewhere previous to the meeting, and he probably solves the problem by going home, or he stays in town and drifts into some other more attractive centre for that evening.

Now if the meetings were held somewhat earlier, it would be possible to adjourn at a reasonable hour and spend some little time in friendly chat. This system would also have the advantage of catering for those who come from a distance and who have to catch an early train.

It is, I think, generally admitted that the value of the recent successful architectural congress, and of many other similar gatherings, lies in the opportunities given for social intercourse, which probably do more to achieve the objects which the promoters have in view than any other part of the proceedings.

In a Society where the members are so widely separated as is the case with ours, it behoves us, I think, to do all we can to give our members an opportunity of meeting together on the lines I have indicated.

I do not wish to labour the point unduly, but we have, as a Society, certain objects to carry out which we can only successfully do by personal co-operation, and how can we secure this unless we make opportunities of getting into close touch with each other?

Keeping Abreast of the Times.

There is one other point I would like to mention, the necessity for an architect in active practice to keep abreast of the times on the latest details of construction and materials, important legal decisions and other matters. How is a busy man to do this when all his time is taken up in the infinity of details which go to make up a practice of any dimensions?

The tendency of the day is to specialise, and there are in every branch of the profession men who have made a particular line their exclusive study, and who would probably be prepared, on terms, to give other architects collectively the benefit of their experiences on the lines of the "post graduate" lectures which are so successfully given in connection with other professions, notably the medical.

I should think there are many architects, whether members of the Society or not, who would be glad to avail themselves of such opportunities of obtaining the latest information on technical and scientific details or problems.

I hope that some of the ideas which I have ventured to put forward for your consideration may be developed and realised to some extent, at any rate, during my second term of office, and that we may look forward at no distant date to the time when the Society may be the centre of much practical assistance to its members.

Benevolence and Charity.

I spoke just now of apathy in the profession, and I think I was justified in doing so when I consider the attitude adopted by the profession towards such an object as the Architects' Benevolent Society. Architects have been individually passing through a time of great difficulty and depression; the population is not increasing at the same ratio as heretofore, and therefore, proportionately so many extra buildings are not required for housing. It is estimated that there are over 60,000 houses to let in the London district, which does not allow of numerous new buildings being erected, that will show a reasonable profit on the outlay. Architects, on the other hand, are becoming more numerous, and where sufficient work is to come from is a serious question that they will have to face. Registration would have a restrictive effect, and prevent overcrowding and consequent distress. Architects, however, are not unmindful of their obligations to their less fortunate brethren. Why then is it that the Benevolent Fund is not supported by more than one-quarter of the profession? Would it not seem that this is due to the fact that the work of the Benevolent Society is practically unknown, or that it is too limited in its scope? If so the remedy evidently lies in reorganisation on a more liberal scale.

The benefit of the Fund might be extended to include not only those in immediate distress, but also those who may wish to make provision against contingencies, such as sickness and temporary loss of employment. This would be a real boon to many, and it would appeal to every grade. It is stated in the report of the Benevolent Society that the expenses incurred in the present method of making the Fund known are not justified by results. Then why not try another way which would cost practically nothing? For instance, at every social function or other suitable occasion the charity box might go round, and similar boxes be permanently placed on the premises of the various architectural societies. It appears to me to be false modesty to hide the fact that in our profession, as in others, there is a great deal of poverty and distress, and why should we hesitate to put forward the claims of the Benevolent Fund at all proper seasons? Some years ago it was proposed to hold a festival dinner, when our Society appointed stewards who would doubtless have taken up a welcome addition to the funds, but for some reason the function was abandoned. I hope, however, it may be revived, and that on every possible occasion the claims of the Benevolent Society may be remembered.

Salaried Officials and Private Practice.

Just now there is a revival of the outcry against the principle involved in salaried officials undertaking private practice, more especially the carrying out by them of large public buildings. No doubt there is a real grievance here, but it is aggravated where a local authority places its architectural work in the hands of an official whose training has not been in any sense architectural. In such cases the local authorities endeavour to appeal to the ratepayers, as against the architects, on the ground of an apparent saving in the rates in having no outside architect's fees to pay, whereas, as a matter of fact, it is very often the case that the building is found to have cost a great deal more than would have been the case by employing an outside architect. The latter is often in the unfortunate position of having to contribute to the support of a department which is robbing him of his legitimate field of operation, and he suffers as a ratepayer as well as an architect.

It is, of course, to some extent the architect's own fault, as even local authorities could be dealt with under an Act of Parliament. The outcry is against the system, and not against the individual, who would frequently prefer not to have the additional responsibilities thrust upon him and who is often placed thereby in a very difficult position in regard to his relations with his brother professionals in the district.

The bitter cry of the architect is heard not only in

England but in Ireland, where, however, steps have been taken in the right direction by the insertion of a clause in the Labourers Act which prevents the employment of an unqualified person as architect for the purposes of the Act. Grateful as we are for the concession, it does not go to the root of the matter, and nothing short of registration will protect the architect from unfair competition by public bodies as well as individuals, or the public from having thrust upon them buildings which can in some instances only be characterised as monstrosities.

Light and Air.

An important decision of the House of Lords on "light and air" was given on October 25 last in the action of *Jolly v. Kine*, the parties in this case being the owners or occupiers of two adjoining plots of land forming portions of a building estate situate at Acton, in the county of Middlesex. The arguments were chiefly based on the well-known case of *Colls v. the Home and Colonial Stores*, at the conclusion of which, it will be remembered, Mr. Colls was presented by the Society with a tangible token of their appreciation of his efforts on a question of principle. The Lord Chancellor, in *Jolly v. Kine*, expressed his profound regret that, in a matter comparatively small, such enormous costs had been incurred. It behoves architects, therefore, to be very careful and cautious when even a trivial question of "light and air" is raised by a neighbouring owner or occupier, as it might land a client into a serious position. The case is too long to refer to at length in my address, and those interested in legal matters should read the report of the case in full.

Some years ago the Society petitioned the then Lord Chancellor (Lord Halsbury) with a view of obtaining an amendment of the law on the lines which are found to work so well in Scotland, where it is possible to ascertain exactly beforehand the limit to which an adjoining owner can go, so saving the consequent risk and expense of an injunction.

Possibly an interview with the present Lord Chancellor might do something towards bringing about a more common-sense method than at present prevails in England.

Selby Abbey.

I am much grieved that one of the noblest Norman abbeys in our land, and which I visited during the present year, has been destroyed by fire. The loss of Selby Abbey is a sad and national disaster; however, let us hope that measured drawings have been made of all its beautiful details, and that the abbey may be wisely restored in all its pristine grandeur. Our historical buildings should now be carefully surveyed so that fire may not rob us of any other architectural treasure, and it would be well if some more definite arrangements than at present prevail in some districts could be made for their safeguarding from damage by fire or other cause, and that those who have charge of these buildings should see that they are insured to their fullest value.

Public Street Improvements.

The London County Council has decided to erect new offices on the Surrey bank of the Thames, and architects will be invited to submit competitive designs. I sincerely hope that many of our members will compete, and that one of them will be the architect entrusted with the erection of this important building.

The Strand widening cannot at present be properly called an improvement; the wretched appearance of the old buildings on either side of Kingsway for all this time is one of the most miserable sights of London. Probably nothing much will be done in the way of development until the impossible restrictions and stipulations are removed, as no one would venture to invest huge sums of money and at the same time be under the control and caprice of the Council.

Public confidence in the London County Council has been rudely shaken, and will not easily be restored in connection with schemes for public improvement of any magnitude.

The flanks of street buildings which soar higher than adjoining buildings are often ill-considered, and a street is sometimes shorn of its beauty by the ugly flank of the higher building. In some cases "light and air" are responsible for this, or the architect had counted on the adjoining lower building being some day rebuilt as high as the one he has erected, but this does not always take place, and so the unsightly flank of perhaps a very handsome frontage may remain an eyesore for a generation to gaze upon.

Government Control of Art.

Recently, I accompanied the Lord Mayor of London on his visit to Paris, and was delighted beyond expression with the magnificent streets and majestic public buildings. Paris is in appearance quite a new city when compared with London, and the law evidently allows the Parisians to acquire properties for public purposes with much greater facility than here, and hence the splendid manner in which the streets are planned. I went to Paris as a member of the Court of Common Council of the City of London, and also as President of this Society, and in the latter capacity received a most cordial reception from most of our eminent and distinguished *confrères*. Art is much revered and appreciated in France, and a Minister of Fine Arts is appointed to preside over its destinies—we might do well to imitate and have our art treasures and historical monuments controlled by the Government. A visit to Paris next summer by the Society would be a highly interesting outing, and is worthy of being carefully considered at an early date in order to learn if the suggestion meets with the general approval of the members.

Our Art.

The architect of to-day can hold his own with the greatest men of the past, and our builders can build quicker and better than of old, as evidenced by many of our new public buildings. As an artist the architect of to-day is far in advance of the painter or sculptor, his production rightfully receiving the well-earned encomiums of an appreciative public to a greater degree than ever before. We may compare some of our buildings to-day with the monumental Egyptian, the refined Grecian, the stern Roman, the picturesque Mediaeval, the palatial Renaissance, and feel that as artists we are not decadent, but are daily adding dignity to our cities and towns.

There are encouraging signs on every hand that the public is growing more and more discerning in the matter of architecture and the public taste more cultivated, and we, and those who are to follow us, must be prepared to rise to the occasion, so that we may leave lasting memorials of our art, not forgetting that beauty in architecture is one of the most valuable assets which a community can possess. What is it that attracts people to the continental cities and centres, but the opportunities of seeing art treasures housed in magnificent buildings? There is nothing in the world which appeals more to the best instinct of the mind, or which awakens nobler thoughts and aspirations than the contemplation of some striking erection or group of buildings, and in various parts of the kingdom our predecessors have left us many noble specimens of their art.

Only to few it is given to rear the stately buildings which shall be the pride of Englishmen now and always, but we all share in that love of our art which is the distinguishing characteristic of every architect, and hence we find ourselves to-day banded together in societies and institutions, each working towards the same end, if by different ways, hoping for the day when all these active agencies may be united in one common bond with but one aim, the true advancement of our art.

FILING DRAWINGS.

IN the offices of American architects and engineers the system of filing and indexing drawings and other documents connected with works is carried to an extent beyond that adopted in England. The numerous patented cabinets, drawers, &c., give efficient aid in the arrangements. The Chief Engineer of the Board of Water Supply, New York, has issued a volume on the subject for the use of his assistants.

In the first place, standard sizes have to be adopted not only for drawings, but for field notes, diagrams, specification forms, calculations for details, letters, reports and official communications. Filing is to follow a prescribed method. The following directions are given about filing and indexing drawings, and they are worthy of attention in offices where a large number of drawings must be preserved:—

One man in each office shall be held responsible for the proper filing of the drawings, and he alone should be allowed to put away drawings. In each office all drawings received from other offices should pass first through the hands of a designated man, possessed of sufficient knowledge, who will see that each drawing is properly introduced into the system of filing and indexing or otherwise

attended to. Drawings are to be filed in the plan cases provided for the purpose and indexed on 3 by 5-inch cards, which will be kept in convenient cabinets. Cases and drawers will be numbered.

Besides bearing a case and drawer number to show where it is filed, each drawing will be given an accession number which will distinguish it from all other drawings and consequently be the convenient and certain designation for the drawings in computations, correspondence or conversation. Accession sheets will contain complete description and record of every drawing made or acquired by an office of the bureau for permanent filing. There is a double space across the accession sheet for each drawing.

An accession number shall be given to a drawing as soon as it is well started, at any rate as soon as any computations are made relating to it. The exact title and description can be filled out on the accession sheet when they are determined. This applies to the paper drawing. The tracing of a drawing is given the number already taken, unless the drawing contains important matters not traced, or is traced on more than one tracing, or the original paper drawing is kept permanently, in which case a new number is taken for the tracing. The paper drawing should be endorsed:—See tracing of same number, or Traced partly as Acc. —, as the case may be. If a drawing is revised, the new drawing should be given a new accession number and date and marked, Revised from Acc. —, and its predecessor should be marked, Superseded by Acc. —. The same notes should be written in the accession sheet under remarks and on the index cards.

Temporary accession sheets, properly numbered on the line for each drawing, will be kept in each drafting office, on which the draftsmen can make entries as needed. When a temporary sheet is filled, a new sheet properly numbered in advance will be substituted. The filled sheet should promptly be checked and corrected, and then sent to headquarters or some other office having a large flat-plate typewriter, where it will be neatly copied in triplicate. One copy with the original will be returned, the second sent to the appropriate department office and the third retained at headquarters. These copies will be kept in suitable loose-leaf covers. After filing the final accession sheets and copies, the temporary sheets may be destroyed.

As soon as a drawing which is to be kept permanently in any board of water supply office is received from some other board office, it is to be indexed under its original accession number and not reaccessioned. Each drawing therefore will bear but one accession number by which it can always be identified in whichever office it may be.

The accession number is to be put in ink on each drawing in its lower right corner. The entry is to be made on the accession sheet, as directed below.

Under Title, write the title of the drawing in full, excepting the two lines which appear on all drawings made in board offices:—City of New York. Board of Water Supply. Under Description, write briefly enough about the drawing to tell what it shows. Do not repeat what is in the title, but supplement it. Abbreviations which can be readily interpreted may be used here. In the column headed Purpose of Drawing, use the following abbreviations:—L, land plan or map; P, preliminary drawing or study; C, contract drawing; W, working drawing; E, estimate cross-section, progress diagram or similar drawing; R, record drawing (of completed construction work); Z, foreign drawing used for reference. Under Kind of Paper and Size in Inches, use the following abbreviations on the upper line and on the lower line write the outside dimensions of the drawing:—W, white paper; B, brown paper; T, tracing cloth; T P, tracing paper; W P, white print; G P, gray or green print; B P, blue print; Black, black print; Lith, lithograph; Cr-Sec, cross-section paper or cloth; T Cr-Sec, tracing cross-section paper or cloth; Pro, profile paper; T Pro, tracing profile paper; Neg, Vandyke negative; M, mounted on cloth (to be written after other designation).

The different departments will be designated by letters in filing, indexing and accessioning drawings, and will have colours given for distinguishing index cards. Foreign drawings, meaning those originating outside of this Board's jurisdiction, will be designated by an X. Divisions will use their department colours and be designated by letters. Each department office and each division will accession all its drawings independently, each having a series of numbers beginning at 1; but each department office will place before the number its department letter. Each division will place its division letters before its number. Thus:—491, S 5440

and F 721 indicate drawings originated in the headquarters, southern aqueduct and filtration department offices respectively, and NE 299 is the accession number of a drawing originated in one of the offices of the esopus division of the northern aqueduct department. Division offices will supply section offices with accession numbers by sending temporary accession sheets properly numbered in advance. Section office drawings will be accessioned as though they originated at division offices; that is, a section office will not have an independent series of numbers, but will use blocks of numbers in the division series.

Computations.—For survey computations, such as stadia notes and traverse tables, and for estimates for payments under contracts, special sheets are provided.

Each assistant engaged upon general computations will be furnished with an individual computation cover holding standard punched computation sheets $8\frac{1}{2}$ inches by 11 inches in size, with printed blank heading. All general computations must be made in ink on these sheets, using one side only, except as otherwise directed by a department or division engineer. The margin on the left of each sheet must be kept blank. This will make it possible to get a print of any sheet if needed, and thus save copying. Computers are expected to provide themselves with fountain pens for black and for red ink. Corrections shall always be in red, no erasures being made. Carter's Raven black ink is suitable for obtaining blue prints.

A carefully selected and classified list of subjects for file numbers of computations has been prepared. This classification of subjects, with an explanation of its use, will be issued as a separate publication, and assistants should study it so that computations may be made exactly in accordance with it. In this system numbers and letters are used to designate subjects and the nature of computations upon them. The list thus becomes an index showing the order of filing of computations, differing from the usual index in that it exists before the matter to be indexed is composed and constitutes a mould in which the matter is cast. The index therefore exists early in the work, instead of being delayed in formation until it is of little use.

In order that the index shall remain a true one, however, it is necessary that it shall be rigidly followed, even when seemingly strained. To keep the work uniform a competent engineer should be designated in each office to supervise the selection of the file numbers and do the filing.

Before beginning any computation the "file No." given in the index of subjects should be ascertained and inserted in the sheet, after which, under "Subject," should be written the classified subject and subdivision and, briefly and clearly, the nature of the computations. If the list of subjects seems inadequate or inapplicable in any case the attention of the engineer in charge should be called to the matter so that a suggestion for improving the list may be sent to headquarters and necessary additions or modifications made.

When as is usual a number of computations of various sorts are necessary to solve a comprehensive problem, the individual computations should be general in their application and elementary so far as possible, so that the individual computations may be useful in solving other problems. For such cases the results only need be collected and used in solving the specific problem. In order, however, to show under what conditions the individual computations have been made, a reference to the main problem that occasioned them is to be placed, by subject and by file and accession numbers, after the heading "Made in Connection with —"

In the space for "Acc. No." on each computation sheet is to be placed the department and division letters, followed by a hyphen, the letter denoting the computer and the figures giving the serial number of the computation sheets used by the computer in question.

In each office, in addition to the engineer in charge of filing of computations, a man is to be designated to keep a stock of numbered sheets for each man belonging to the office. This rule has been found necessary to insure against duplication of numbers and uncertainty as to the next consecutive number. Temporary men or men doing little computing need not be given letters but may use sheets belonging to the men under whom they are working.

The signature of the person making the computation and of the one checking, as well as the date on which the computations are made, should be inserted in the places provided on each sheet. In writing the date the month should be indicated by the first three letters of its name and not by a figure. In case it requires more than one sheet to complete a computation on a given subject, the sheets are

to be numbered consecutively 1, 2, 3, &c., in the space, Sheet No., and the whole number of sheets in the computation is to be inserted; but if one sheet only is used, these spaces should be filled with a dash.

Sufficient explanatory notes should be inserted to make each computation perfectly clear, and whenever data are taken from another sheet its file and accession numbers should be given in brackets. The letters indicating department and division should be omitted unless the reference is to a sheet of another department or division. Whenever referring to a drawing, use its accession number. A summary of the principal results of a computation should be made when it is evident that such a summary would be convenient for reference.

Under no condition shall a sheet be destroyed. If for any reason a sheet should become useless the prefix X, meaning superseded, is to be inserted before the file number and the sheet turned in with the other sheets at the proper time. "Superseded" should also be written or stamped in red across the face. Superseded sheets are to be filed in a separate book.

During the day while computations are being made or checked, assistants may, for convenience, remove the sheets from their individual computation books, but at night all sheets must be returned to the covers and fastened in. Avoid, so far as possible, having sheets with computations lying around loose. Suitable binders or covers are provided for the permanent filing of computation sheets, in which completed sheets will be arranged according to the system. Each binder should be plainly marked so as to show the file numbers included in it. These will be distinguished as reference computation books.

Whenever sheets have been completed and checked, they must be turned in promptly to the engineer in charge of filing computations, who will file them in reference computation books. Sheets which have been thus filed should seldom be removed, and then only under such regulations for refiling correctly as the engineer in charge of filing may find suitable. Sheets fastened in covers must be turned with care to avoid damage.

If it should be found that an error has been made in any computation, the engineer in charge must be notified at once, so that the mistake may be rectified in all places affected. Be accurate, systematic and neat. Do not waste time on unnecessary refinement. Do not use more decimals than the accuracy of the data and the necessities of the result make advisable. Use slide rules, computing machines, logarithms and diagrams whenever their use will economise time and secure sufficient accuracy. Checking, especially of important computations, must be done independently. Going over the other man's figures is not checking. Errors in data, methods, deductions or judgment must be detected as well as blunders in mathematics.

Make it a rule to use tabular form for computations whenever possible. A little preliminary thought will usually show a method of tabulation and the computation will be more quickly done, more likely correct and much more easy of reference, besides enabling additions to be made to widen the scope of the results. Mathematical work which can be done by slide rule or computing machine should be left off the sheets. The tabulation will indicate the process followed. Be brief. Use judiciously abbreviations which are sufficiently self-evident. Do not repeat unnecessarily. Do not waste time stating matters of common knowledge such as value of P and what it means, or deductions of formulæ which can be readily found in text-books.

IVORY IN THE ARTS.*

THE history of ivory carving goes back to the most remote antiquity. Centuries before the Christian era we can point to examples in the days of the earliest dynasties of Assyria and Egypt. Far earlier still, recent discoveries in the cave dwellings of the south of France have placed us in possession of the work of a people who existed at so remote an epoch that we cannot assign them any definite date in the countless ages which have passed since man existed, but must content ourselves—at least in this brief survey—with the appellation prehistoric. The earliest classical writers and the pages of Scripture teem with references to the use of ivory, its profusion and the esteem in which it was held as a decorative material. Most

* From the Cantor lecture, by Alfred Maskell, F.S.A., published in the *Journal of the Society of Arts*.

familiar of very many in the Bible which I might quote is the reference to the great ivory throne, overlaid with pure gold, made for King Solomon by the skilled workmen of Hiram, king of Tyre, of which it is said that "there was not the like made in any kingdom." And again, in Ezekiel, "the company of the Ashurites made their benches of ivory brought out of the isles of Chittim." We have not many remains of the work of the fine periods of ancient Greek and Roman art, but of the time of the Consulates of the Roman Empire there have been preserved somewhere about fifty of the remarkable ivory plaques called consular diptychs, which are a unique and valuable contribution to the history of those times. Then, again, after the establishment of Christianity and during the centuries of unrest and strife which we are accustomed to call the Dark Ages—when there is an almost complete absence of monumental sculpture, and a default in almost every description of learning and art—at least an absence of examples—it is to ivory that we owe the uninterrupted preservation of types and traditions from Classic times to the Renaissance. It will be best—as our time is limited—to take each section separately, with a few words of introduction as we proceed. You will bear in mind that I shall confine myself to salient points and typical instances.

The caves of the Dordogne have yielded the remarkable examples of the work of our prehistoric forefathers, of which I shall show you a few specimens. Who they were and at what date this people existed is a question impossible to answer. The investigations of geologists can deduce only some shadowy period in the distant ages of a far-off antiquity in comparison with which the building of the earliest of the Pyramids—and that is at least a thousand years before the time of Abraham—is almost recent. It is certain that the climate of their days was very different from that of Southern Europe now, and there appears to be some evidence to connect these cave-men with the present Esquimaux. Certainly they lived at an age when the mammoth and elephant and the reindeer roamed freely over those regions which are now part of civilised France. Many fragments of carvings and engraving on ivory and bone have been found. The first which I throw on the screen shows you—if you look carefully—a sketch of a mammoth drawn upon a slab of ivory, the product of that very animal. Here are some more sketches on reindeer-horn and ivory. It is impossible to help characterising these designs and carvings as absolutely artistic in conception and execution. The intuitive knowledge of these primitive peoples who in other respects were not removed from savages is nothing less than natural genius, with an innate comprehension of that which usually requires years of training and cultivation. Art is, after all, a convention and not a direct imitation of nature. Yet here we find, at a remote period of man's existence, this uncultivated savage instinctively adopting a convention, a system, a mannerism which no previous evolution could have led up to. It would not be surprising if we found of their handicraft that they had a taste for modelling in some plastic material—for instance, this figure of a seal—still our admiration and astonishment would not be so excited as when we are led to examine these examples of absolutely clever and artistic sketching. They are not drawn as a child would draw them, nor even in the manner which a sailor uses when he engraves figures of men and women, ships and animals in outline on sperm-whale teeth. Here is a specimen of such an engraved tooth. They are drawn by the hand of a genius who in his way had nothing to learn, but from whose work his fellow artists uncounted generations later could derive much profit.

I leave with regret these extracts from the notebooks of our primitive ancestors. Many more exist of almost equal interest upon which much might be said. The question arises—and it is a natural one—are they genuine? I can only say that so far they have been subjected to the most searching investigations of numbers of distinguished men, amongst others, Sir John Lubbock, now Lord Avebury, and though forgeries of such things have been made, as of everything else, these, so far as we can be certain of anything, are authentic.

The history of ancient Assyria is almost entirely wanting, and of its civilisation and magnificent cities there remain only mounds, and heaps of debris covering the ruins which for three thousand years and more remained unknown, until in our own days our countryman, Layard, at length unearthed them. Most people are acquainted with the marvellous and gigantic monuments, the huge winged bulls dug up by him, now in the British Museum. But how many

notice the two small cases close by, containing about a hundred fragments of beautiful ivory sculpture from the same excavations? Many of them were in such a fragile condition that they separated into flakes and almost fell to pieces, and probably all would have done so before long had it not occurred to their discoverer to restore to the ivory the gelatinous matter which had dried up in the course of centuries. This was successfully done by boiling in a solution of gelatine and alcohol. Here are some examples. I may say that in the case of many of the specimens time and perhaps fire have considerably altered them, so that some resemble ebony, basalt, sandstone, even opal, rather than ivory. Their age? Well, perhaps as old as Nineveh itself, say 2,000 years B.C., and there are fragments of a similar kind from Abydos, which are possibly 2,000 years older still. It gives terribly to think, as the French say, does it not?

Diptychs were a kind of writing tablet, used by the ancients and indeed throughout the Middle Ages down to almost recent times. They were covered on the inner sides with a thin layer of wax, on which the writing was made or erased with a metal point or style. It was the custom of the consuls on their inauguration to present such tablets to distinguished personages, and these presents were usually of fine ivory, often sculptured with the figure of the consul himself. From about fifty to a hundred examples—ranging from the middle of the third to the middle of the sixth century A.D. are known, and as their date is certain, and the subjects of great interest, their historical value would be difficult to overestimate. The money value, should one hitherto unknown turn up, would be, I think—in more senses than one—a subject for speculation. Here are some casts of a few of these magnificent slabs of ivory, and I show others on the screen. Diptychs were also used for private purposes. This is an example of one of the finest known—a Roman diptych of the third century—now in the Kensington Museum. They gave 400*l.* for it in 1865. The value of all works of art has of late years, as you know, risen in an inordinate degree. What such things as these and the Mediæval ivories we shall come to presently would realise if now in the market it would be difficult to say. I should think for this piece 10,000*l.* would be ridiculously within the mark.

For many centuries, up to the fourteenth, in all matters relating to art the Church was predominant. Religion formed the central interest of peoples' lives. Art was the monopoly of religion, and so far at least as our immediate subject is concerned, it would be difficult to find much more than a dozen examples of decorative sculpture the subjects of which are other than sacred ones. But many of these things are of exceeding beauty—with a certain mannerism about them no doubt—yet admirable in their grace and refinement, full of suggestion and delicacy, charming in their elegance of treatment, of the expression of the figures and drapery. Here is first a beautiful example of minute workmanship, a panel perhaps of a casket or a book-cover, French work of the fourteenth century. And here is still more microscopic work, a veritable *tour de force*, for this little book-cover measures only 6 by 4 inches and yet depicts with admirable art no less than thirty distinct episodes from the Gospel narratives. The next is a rare example of English ivory sculpture of the fourteenth century—rare because we have few examples of English work, and rare on account of its beauty of design and execution. This is an example of the devotional diptychs of the fourteenth century of which many beautiful examples have come down to us. I shall have more to say about them and their workmanship in my third lecture. Such things as these are the outcome not of a commercial spirit or enterprise, not even of the purely æsthetic spirit which governed the artists of the Renaissance, but of the enthusiasm of pious minds, the noble expression of innate and fervent devotion. We must not forget also their teaching value. These diptychs and triptychs were, it may be said, the illustrated books of instruction of the time. Nothing is more wonderful than the way in which, in the compass of a few inches, whole histories and episodes of the scriptural narratives were compressed in the most vivid and telling manner. This is one of the many charming statuettes of the Virgin, which French art especially has handed down to us. And here are beautiful examples of fourteenth-century pastoral staves or croziers. Observe the elegant proportions and sweep of the volute, somewhat small and contracted, and diminishing from the point where it springs to where the curve begins. It is to me unaccountable that the light and

graceful ivory should not be more used for bishops' staves at the present time. It is in every way appropriate and convenient.

The exclusiveness of art for church purposes in the Middle Ages was not, however, absolute. Here is a casket or workbox of perhaps the eleventh century, with classical designs borrowed from earlier sources. And here are some examples of mirror cases, closing in much the same way as our ivory pocket mirrors or puff-boxes of the present day. The scenes upon them illustrate the old romances and episodes of social life. Combs also our ancestors thought it worth while to decorate. These are some specimens: Italian and English of the fourteenth to sixteenth centuries. And, of course, the elephant's tusk naturally suggested itself as a material for hunting horns and drinking horns, such as the next slide shows. When we leave the fifteenth and early sixteenth centuries and their pious usages, we are met by entirely new fashions. Whatever may have been the case with other arts, art in ivory declined. We come to the periods nicknamed Baroque or Rococo. In Germany these styles, together with appalling little nudities, ran riot, yet, especially in Flanders, some exceptions to the general decadence will be found to justify the attention which may be given to them. These are some plaques from a set in the Kensington Museum attributed to one of the best of the Flemish artists, François Duquesnoy, generally called Fiammingo. And this is a very fine tankard—from the Jones collection—the finest that I know in ivory, probably by Fay-d'Herbe.

Finally, for work of this period we have this fine coin cabinet, entirely of ivory. The style and taste may not perhaps be of the very highest; still, for the period it is at any rate a worthy, even admirable, example. Ivory furniture also, in the shape of couches and chairs, is interesting and unusual, and I think our great upholsterers would do well to reintroduce it. These are two chairs from the Jones collection in the Kensington Museum. They are Indian made, after Chippendale or Adam, or French models. Such specimens are not, however, inexpensive. Mr. Jones gave 600*l.* for two of these some twenty or more years ago. The art and industry of India, China, Japan and the East generally there is no time to-night even to describe and illustrate shortly.

It would not be difficult to run on with illustrations of this kind until your patience would be exhausted and your eyes weary. There remain but few words to add to carry us on, for the time being, to the modern use of ivory for decorative purposes and sculpture. I have found that a great many people otherwise interested in the arts are quite unaware that sculpture in ivory in this present twentieth century is worthy of any consideration, or, in other words, that it is practised by artists of distinction. I think I shall be able in my third lecture to dispel this misconception. Meanwhile I will put on the screen—as a fitting finish, I may hope—this reproduction of the work of one of our best-known artists. It is the "Lamia" of George Frampton, now in the Vivian collection.

If I have covered, though briefly, a large extent of ground, if very much more of equal interest remains for us to follow, and if I have succeeded in interesting without sometimes wearying you, and have been able to put before you a little information which, if not altogether novel, may be new to some, I shall have justified my opening remarks, that there is much indeed to be said on the subject of ivory and its uses.

SELBY ABBEY.

AFTER as close an inquiry as was feasible by the Bishop of Beverley (acting as Archdeacon of York), Lord Wenlock and Mr. E. C. Brooksbank into the causes of the fire which broke out in Selby Abbey on the night of the 19th ult., their report has been issued. Information as to the first discovery of the fire was given by Mr. Sykes, who lives in a house at the north side of the abbey. He was at his house door at 11.55 and saw nothing unusual. At about 12.10 his wife aroused him with the information that there was a big light in the church. The light appeared to be shining on the Liversidge window, in the north choir aisle, next to the Latham chapel, which serves as the organ chamber. But when he left his house to give the alarm, he saw that the fire was in the organ chamber itself. There appears to be no doubt whatever that the fire originated in the organ or in its immediate proximity. The verger who has charge of the abbey during the day it appears left at five

o'clock on October 19, having locked all the doors which were not already secured. In the church were Mr. J. H. Compton, the organ-builder, and James Taylor, a youth who was assisting him. Mr. Compton had a privilege key, by which he could let himself in and out of the abbey through the north-west door. A workman named Ernest Wolfe, employed by Mr. Compton, was at this time at his tea. But he returned shortly and remained till eight o'clock, when he finally left. Mr. Compton and James Taylor stated that after the departure of Ernest Wolfe they worked together till 10.30. They then put out all the gas lights in the abbey and removed the wax candles, three in number, which they had been using in the organ. Two of these were then extinguished. They spent about twenty minutes more, partly in the blowing chamber, partly in and about the organ, and then, extinguishing the last candle, they left the church and locked the door. It appeared that on two occasions when he came into the church from the outside Mr. Compton experienced a slight smell of burning, and James Taylor noticed it also. It was in the north aisle of the nave, which is separated from the organ chamber by the whole breadth of the north transept. Mr. Compton endeavoured, without success, to discover the cause of this smell, and James Taylor said that the smell seemed to him more like that of the blacklead or varnish of a stove than the smell of burning wood. About 8.30 Mr. Compton and the youth thought they heard footsteps in the south choir aisle. They searched the church eastward of the tower without finding any person, and concluded that they had been mistaken in the supposition that the sound proceeded from footsteps. Both these witnesses declared that the interior of the organ was entirely free from shavings or other loose inflammable material. But it was admitted that there were some paper packages containing metal pipes resting on the bellows. It was admitted by Mr. Compton that naked candles in metal candlesticks, without any shades or protection, were used within the organ; but he declared that he was certain that not more than three such candles (which were wax candles) were in use on the evening of October 19, and that he knew that they were all removed and carefully extinguished. There was a small temporary gas stove used for boiling glue standing upon the stone floor about 5 feet from the organ. It was fed from a jet within the organ, the gas being conveyed by a tube with indiarubber connection.

From the evidence of other witnesses the following facts were established:—

1. That on a Sunday in August, about 10 A.M., a paraffin lamp was found alight in the organ, standing on one of the pipes. The presumption was that it had been left burning the night before.

2. That on several occasions the workmen were observed smoking when at work. The witness did not assert that they were in the organ when he observed them, but they were near it, and engaged in work connected with the organ. It is fair to say that Mr. Compton denied all knowledge of such action, which was entirely contrary to his orders, and he stated that neither he nor James Taylor ever smoked.

The possibility of the fire being due in some way to the action of the blowing apparatus had been suggested, and this matter was very carefully considered, and Mr. Cousins, the manager of the firm which supplied it, was examined at some length. A personal inspection of the apparatus and the building containing it was made by those conducting the inquiry, with the result that they found the apparatus uninjured except in a place where some burning had evidently been caused by the fall of material from the burning building. They are convinced that the fire was not directly or indirectly attributable to the blowing apparatus or to the gas-engine.

The above statement of all the facts which were elicited by the inquiry is followed of necessity by the declaration on the part of those who conducted it that they were unable to say in what precise manner this disastrous fire originated. They cannot insist too strongly, however, on the need for greater care in the employment of lights within an organ. The evidence in regard to the paraffin lamp and the fact that candles exposed to draughts were used without any protection in an organ largely constructed of perfectly dry wood are both significant. It is said that organ-builders always use unprotected candles. But a practice is not the less dangerous because it is customary, and if it is dangerous it is reprehensible. It should be added that much greater caution ought to be used in regard to the pos-

session of matches by persons engaged in the building or repair of organs.

The circumstances of the fire show how absolutely important it is that means of access to the abbey should be obtainable close at hand at all times. Much valuable time was lost in getting at the fire because the verger, who had the key, lived at a considerable distance from the church. Again, if after the discovery of the lamp in August the precaution had been taken of keeping someone in charge of the building during the night as well as during the day until this somewhat dangerous work was completed, the fire would probably not have occurred. It appears to be absolutely essential that when work of any kind is being done in or about the abbey some responsible official should always inspect the premises thoroughly after the workmen have left the building.

John Evelyn.

SIR,—The remarks of the President of the R.I.B.A. in his opening address, as to the great diarist, lead me to state that this year is the bi-centenary of his death, which occurred February 27, 1706.

A new edition of the "Memoirs" is appropriately just published (Macmillan), with a learned preface by Mr. Austin Dobson. The three volumes are enriched by many illustrations and reproductions from old prints of places and people. To Evelyn's artistic and antiquarian tastes we owe the preservation of the Arundel Marbles, now in the University Galleries, Oxford. His minute notes of many seventeenth-century buildings in London throw much light on the architectural taste and style of that time and are replete with references. By them we re-picture old London, in many ways a more attractive city than to-day. His visits to St. Paul's with Sir C. Wren and others just before and again after the Fire of 1666 are historic pages indeed. His keen perception of arts and letters would alone make his fame, while the colloquial and fascinating style of the Diary will always attract the student of past times and events and the connoisseur of artistic treasures. I am glad to note that the recently formed John Evelyn Club at Wimbledon retains the memory of this writer, and has for its objects the preservation of any historical or local landmarks likely to be obliterated.—
Yours, &c., S. W. KERSHAW, F.S.A.

Banwell Abbey.

SIR,—I find no trace of such a monastery in Somersetshire among the abbeys. Your informant obviously means Banwell Priory, one of the "greater" priories; so there are two mistakes in the two words of the title.

When will people call religious houses by their proper titles? This is the third time within a few months that a monastery has been wrongly classified in the architectural Press, viz. Bolton, Nuneaton and Banwell (or Banwell). Someone will be referring to Glastonbury as a priory next.—Yours faithfully,
JOHN A. RANDOLPH.

P.S.—Banwell Priory, however, is in Cambridgeshire; but I can find no trace of Banwell in my lists of abbeys or priories, greater or lesser. "Mystère!"

GENERAL.

Mr. Alfred Brumwell Thomas is to receive the honour of knighthood in connection with the King's birthday. Among his public buildings are the town halls of Woolwich, Stockport and Belfast. The last was won in public competition in 1897, in which the late Mr. A. Waterhouse, R.A., acted as assessor. The building was opened on August 1, having cost 300,000l.

A Memorial, in the form of an ancient preaching cross, from the design of Mr. W. D. Caröe, is about to be erected in Chevening churchyard to the memory of the late Earl Stanhope.

The Collection of "Photograms of the Year," issued by Dawbarn & Ward, Ltd., will gratify all lovers of photography. The number of plates is surprising in a volume which costs only 2s. They all exemplify the latest efforts to bring photography into closer relation with general pictorial work, and the success is encouraging to amateurs.

Professor Boyd Dawkins and Professor Capper have been appointed as representatives of Manchester University on the art gallery committee of the Manchester City Council.

The Society of Arts will hold the opening meeting of the one hundred and fifty-third session on next Wednesday, when an address will be delivered by Sir Steuart Colvin Bayley. After Christmas papers will be read, among other subjects, on "Smoke Prevention in Factories," "Mediaeval Stained Glass: its Production and Decay," "Engraving and Photogravure," and "The Underground Water Supply of the Thames Basin." Mr. F. Hamilton Jackson is to deliver three Cantor lectures on "Romanesque Ornament."

Mr. A. R. Stanning, the arbitrator in the case of the Letchworth Garden City Company and the Great Northern Railway Company, has issued his award. It amounts to 2,818l. in respect of the 14 a. o. r. 21 p. of land which the railway company are acquiring from the Garden City Company, the claim for which amounted to 13,145l.

The Glasgow Dean of Guild Court granted permission on the 8th inst. to the Corporation of the city of Glasgow to erect a public library, to be known as the Mitchell library, at the corner of North and Berkeley Streets and North Street and Kent Road.

The Holman Hunt Exhibition at the Leicester Galleries, Leicester Square, must close on the 17th inst. in order to make way for a series of water-colour drawings by Mr. Arthur Rockham, illustrating Mr. J. M. Barrie's story, "The Little White Bird; or, Peter Pan in Kensington Gardens."

A Brighton and Hove Archaeological Club has been formed for the purpose of fostering an interest in the antiquities of the county, with a view to the proper recording and preservation of the same; to promote excursions to places of archaeological interest, visits to private collections, meetings for the reading of papers, and, largely, the study of the prehistoric camps and fortifications, of which so many are to be found upon the Sussex Downs and which have never been thoroughly studied and investigated.

The Durham Education Committee report to the County Council that in response to an invitation for competitive plans for the new school at Consett they have received fifty-four sets of plans. These have been carefully examined by the school buildings sub-committee, and subject to the conditions of the competition being fulfilled, they have made the following selection:—(1) Mr. W. H. Knowles, Newcastle-on-Tyne; (2) Mr. J. Garry, West Hartlepool; (3) Messrs. Clark & Moscrop, Darlington. The committee invited thirteen architects to submit competitive plans for their new school at Greenside, and received plans from eleven of them. Subject to the conditions relating to the competition being fulfilled, they have selected the design of Mr. J. Morson, of Durham.

The Council of the University of Liverpool, at a meeting on Tuesday, accepted offers from Sir J. Brunner, Bart., M.P., to endow a Chair in Egyptology, and from Mr. John Rankin to increase the endowment already provided by him for a Lectureship on the Methods and Practice of Archaeology to the amount required for the endowment of a professorial chair in that subject.

The Liverpool Cathedral Committee, after consideration of the terms of the will of the late Mr. Wm. Imrie, announce that about 70,000l. will possibly accrue to the cathedral fund under the terms, but that the amount will not fall into the fund for many years. The money is not expected to be available for the portion of the cathedral now under construction.

The Ulster Architects' Society have resolved "That a committee, consisting of the members and Associates resident in Derry and neighbourhood, be formed under the auspices of the Ulster Society of Architects, and that such committee be empowered to nominate one of its members who shall have a seat on the Council of the Ulster Society of Architects."

The Dean and Chapter of York have, since the fire at Selby, revised the rules to be adopted by the officials in case of fire. Canvas hose has been entirely substituted for the old leather hose, which has become old and worn. Additional hydrants have been placed in the north transept and engine-house, and chemical extinguishers in the organ loft and Bible Library. A ground plan has been prepared showing the exact position of each hydrant within and without the minster, and all these have been submitted to the Yorkshire Insurance Company and approved.

The Architect.

THE WEEK.

It is with unfeigned regret we have to announce the death of CHARLES LOCKE EASTLAKE, who died on Tuesday at his house in Leinster Square. His position was peculiar, for he might be considered as serving as the representative of the much-desired union of all branches of art. The consequence was that different views were taken of him and his work by different people. Some considered him as an official who was long connected with the National Gallery. To others he was in his right position as Secretary of the Royal Institute of British Architects. Many looked on him as an industrial artist who designed chairs and tables, curtains, pottery and plate. Finally, he could be esteemed as an author of valuable books relating to the arts. In our time there was no better example of versatility than was afforded by CHARLES LOCKE EASTLAKE. His life was a busy one and was fairly well rewarded. But those who knew him must have often wished he had confined himself to one class of work, when, if the course was less safe, it would have been an increase of renown. He was born in Plymouth, a town from where several artists came. At the desire of his uncle he entered the office of PHILIP HARDWICK as a pupil, and he also joined the Academy schools, where he gained a silver medal. Then he thought he was better fitted to be a water-colour painter, and he studied for three years on the Continent. In 1866 he was elected secretary of the Institute, and during the ten years he held office everyone was satisfied with his genial spirit. He had never been a Government official, and it was not until his successor was appointed that a circumlocutory system became established in Conduit Street. Old members still speak with regret of those days. In an early number of the *Cornhill* he wrote an article on the fashion of furniture, and it led to a proposal that he should write a book "Hints on Household Taste," which is interesting, although it shows the influence of the then prevailing Gothic spirit. Another admirable book of his was "The History of the Gothic Revival." LORD BEACONSFIELD is credited with skill in discerning character, and his appointment of CHARLES EASTLAKE as keeper and secretary of the National Gallery was evidence of his perceptive power. While at Trafalgar Square, by his marvellous tact he succeeded in prevailing on the Trustees to adopt several improvements. To magazines and journals Mr. EASTLAKE was a voluminous contributor, and it could be said of him that whatever he touched with his pen he adorned. His busy life has come to an end, and although he never attempted any ambitious performance, there is no doubt about his rendering genuine service to all the arts.

THE decision given in *JOHN GREENWOOD, LTD. v. HAWKINGS* demonstrates that in order to render sub-contractors liable for compensation to injured workmen it is advantageous to make assurance doubly sure by having a special agreement on the subject, in addition to the provision furnished by the Act. While engaged in rebuilding the Guildhall Tavern one of the workmen was killed. Messrs. GREENWOOD, as the undertakers, had to pay 200*l.* compensation and other expenses to the man's representatives. Accordingly they claimed, in return, to be recouped for the outlay. Messrs. GREENWOOD had taken the precaution to seek an indemnity from the sub-contractor by which they were to be indemnified from all claims under the Workmen's Compensation Act. The document was not, however, signed, although the work was executed. No doubt the man had regarded himself as the contractor, for he

had been engaged by the architect to execute the ornamental stonework. The defendant did not reply to some correspondence, and Mr. Justice BIGHAM declined to admit that the neglect arose from pressure of work. Judgment was accordingly given for the plaintiffs for the full amount. If the indemnity was not sought it is possible that the case would have had a very different result. But as the letters written by Messrs. GREENWOOD, which were not answered, were before the Court, it could easily be seen that the defendant had formed an incorrect notion of his position. Whether agreed to or not, the request for indemnity has a legal value which cannot be gainsaid.

PEOPLE who visit Portsmouth occasionally and who are gratified by the correspondence in the levels of land and water are not aware of the inconvenience which arises every year through that condition. In several parts of Portsmouth the arrangements for drainage are rendered useless through the immense pressure offered by the mass of the sea. One of the impediments to the extension of the town arises from that cause, as it is feared that no arrangements could be made at a reasonable rate which would comply with the requirements of the local authorities. Mr. J. H. STREET appears to be an especial sufferer. He is the freeholder of a large area of building land which he is anxious to develop. In December last he deposited with the engineer of the borough, in accordance with the by-laws relating to new streets and buildings, plans for seventeen proposed new streets to be constructed in the borough, and covering a large area of land. The works committee, having given the matter consideration, appear to have reported that they disapproved the plan unless the Town Council took power to determine the level of the streets, which they recommended should be 9 feet above Ordnance datum. At the meeting of the Council held on January 9, the report was adopted. The Portsmouth Council have the privilege of dealing with everything which does not exceed 30 feet above the Ordnance datum, and Mr. STREET was informed that his roads must be at least 9 feet above that datum. That would mean that the houses would be built in hollows, or that the level of the whole of the building sites should be raised. Mr. STREET endeavoured to have an appeal brought before the Local Government Board, but they declined. He then appealed to the King's Bench. Their Lordships came to the conclusion that the Local Government Board was right in declining jurisdiction, and leave to appeal to a higher Court was refused. It is stated, however, that there will be an appeal, and unless there is one it is not easily imagined how the estate can be laid out in building sites.

THE Tribunal of Appeal have pronounced a judgment which is likely to give rise to some amazement in the ordinary courts. Regent Street and Piccadilly are being transformed, and among other changes it was proposed to erect a building 110 feet 6 inches high beside the Vine Street police station, which is to some extent used for clerical purposes. The streets about this part of London are very narrow. It might be supposed that with so important a subject the usual procedure would be adopted by taking an action for interference with light and air. But the parties hold under the Commissioners of Woods and Forests and are subject to an agreement not to institute such actions. Care was therefore taken in the argument of counsel to avoid all points of law. It is difficult to obtain sites in the neighbourhood of Regent Street, while for many reasons it is a convenience to have a police station close to the thoroughfare. No doubt the police station will be less adapted for residential purposes than heretofore. The Tribunal of Appeal, however, declined to depart from the decision of the Building Act committee, and a sum of 120 guineas costs was allowed to the hotel syndicate.

ENGINEERING: ART, NATURE AND LAW.

THE address of the new President of the Institution of Civil Engineers—Sir ALEXANDER B. W. KENNEDY—is calculated to create an interest among others besides the members. During several years he has practised as a consulting engineer. In consequence he has become acquainted with the details of various branches of engineering, yet at the same time it is difficult to determine of what particular branch he is the representative. As a result of his own practice there is a breadth of view in his remarks by which they are distinguished from those of his predecessors. Most of them were specialists, and they did not hesitate about devoting their address to an abstract of the latest information about railways, bridges, telegraphs or waterworks. Sir ALEXANDER KENNEDY, on the contrary, discoursed on some of the relations of engineering to other things.

Young people talk so glibly about professions at the present day, it is difficult to say what the term means. The President, as an arbitrator, has an aversion to loose expressions. "I am not sure," he said, "what authority is entitled to say whether engineering is or is not a profession. It must be a very young one certainly, if it is one at all." But calling engineering a profession has not prevented men who claim the title from acting unworthily or improperly, in a way that would be impossible among lawyers or doctors. He also considers it is unfair for men to act as contractors and consultants at the same time, and he declared that so far as he knew every such attempt ended in failure. There is excellent advice in many parts of the address which engineers should lay to their hearts, for it has been derived from the author's own practice.

It is, however, from the observations of a wider scope that the address gains its unique character. The members must have looked at one another with amazement when they heard the President commence to speak about the points of contact between the engineer and the artist. For a number of years critics have been asking whether any beauty can come out of Great George Street. While the Lambeth Suspension Bridge and the Charing Cross roof were allowed to exist in the vicinity of the Institution, the answer must have been in the negative. And yet such indifference to beauty of form was comparatively modern. TELFORD contributed articles on architecture to BREWSTER'S Encyclopædia, and although they were without novelty they at least testified to his respect for Roman work. Waterloo Bridge and London Bridge are creditable to RENNIE. His Southwark Bridge is also an excellent example of construction, but it has suffered through the prejudice against cast-iron. The President was able to say that in his apprenticeship days he found the bed-plates, entablatures and other large castings were finished with mouldings derived from Classical models. The change really dates from the incoming of wrought-iron as a material of construction. The experiments for the Britannia Bridge demonstrated that the graceful curves which TELFORD introduced into the Menai Bridge were of no account. It was not necessary to give an arched form to wrought-iron bridges. And, indeed, it was soon found that everything added to the straight beam was a superfluity meaning an addition to the load to be carried and extra expense. One notorious example of an "ornamental" wrought-iron bridge is to be seen spanning Ludgate Hill.

The President asked pertinently what objection can there be to a long, straight line? It was employed by the Greeks and other great builders. We must not expect a civil engineer to be satisfied with repeating a formula such as "the curved line is the line of beauty," unless he can discover why the curve should have the preference.

Nothing is easier than to repeat that axiom, as if it contained the pith of the science of æsthetics. But when the grounds for its adoption are investigated they are far from being clear. Sir ALEXANDER KENNEDY would see something to approve in the Cannon Street Bridge if it were not for the balls surmounting the piers. But he recognises, and for that architects will be grateful to him, that the artist can serve the engineer. For co-operation there must be breadth of view. When the Thames Embankment was first opened critics sneered at the work, and at the repetition of the lions' heads which were without much use. But it is now realised that the Romans never erected a quay wall to surpass it, and it is superior to the quays at Paris. Again, such a colossal fortification as the *Dreadnought* must impress all observers, for countries where art is cherished are willing to imitate its lines. The great reservoirs of the Birmingham Waterworks can also be truly described as having grandeur. To ornament them would be to deprive them of their character, for in their simple majesty they are almost comparable with the hills around.

Sir ALEXANDER KENNEDY is an ardent mountaineer, and, like all men who are smitten with the love of the Alps, he cannot shut his eyes to the results of the greed which tries to cover salubrious spots with gimcrackery structures, in order that profits may not be delayed. One unhappy case is referred to. Through the persuasions of some English physicians St. Moritz became a favourite resort for invalids. The President does not exaggerate the aspect of the place when he says:—"St. Moritz itself, spread in all its hideousness about a lovely lake side, is nothing less than a scar on the face of the earth—an absolute shock when you first catch sight of it suddenly. In this, happily, we engineers cannot be held responsible. I would gladly believe that Swiss builders employ no architects, if anyone would only say so authoritatively."

As we have pointed out, the President has gained reputation as an arbitrator. What he says concerning the relations of engineers to the law may be accepted as representing his professional experience. He considers that if work were carried out faithfully and in accordance with the contract deed, there would be less demand for the services of a lawyer at a later time. He advises that the engineer should carefully go through the drawings and specifications, and examine them from the contractor's point of view in order to find out if anything doubtful has been allowed to slip in. The engineer should define exactly the results which he wishes to attain. On the other hand, it is possible to have an excess of detail. No greater mistake can be made, or any mistake more likely to lead to vexatious litigation later on, than a crowded specification with detailed particulars which every competent contractor would carry out in his own way. The President is strongly opposed to the practice of making the engineer the arbitrator in relation to his own specification, for his attitude should be that of a judge rather than that of a party to the dispute.

The President was for some time Professor of Engineering in University College, London. He is therefore qualified to speak on education, as on other subjects, with the confidence of an expert. The engineers have ways of their own, and when they attach no value to classics it may be taken for granted that the advantages of the modes of education based on Greek and Latin have not been apparent in English offices. Science should have precedence, and the engineer ought to have the earliest opportunity of freeing himself from youthful leading-strings. One mistake of young engineers is that they believe in half a dozen different ways of doing everything, but a little experience soon teaches them that other people are able to obtain similar results by quite different methods.

The whole address is well deserving of careful study by everyone connected with any branch of construction. We find at the present time that engineering construc-

tion is a familiar phrase to people who a few years ago could not comprehend what it signified. Instead of adopting venerable formulæ to determine the size of walls and beams, those parts have now to be subjected to the same modes of calculation adopted for bridges. It remains to be seen whether the engineers will be satisfied to allow themselves to be regarded as mechanical assistants or calculating clerks. But whatever may arise, everyone will echo the wish of the President that engineers ought to be able "to set the world at large an example of tolerance and broad-mindedness as citizens which would not be easily reached by any other class of the community."

"SERIOUS AND WILFUL MISCONDUCT."

IT is well known that the Workmen's Compensation Act operates as an insurance to the workmen to whom the Act applies against the risks of injury and death incident to their employment, and that the burden of thus insuring their workmen is placed by the Act upon the employers. If a workman has been killed or injured in the course of his employment, whether by his own carelessness, or by the carelessness or deliberate act of another, or by sheer accident, the employer is liable. The only defence based upon the conduct of the workman which the employer can make is the defence that the injury was due to "the serious and wilful misconduct" of the workman himself. The question of course arises, What acts of the workman will amount to misconduct so serious and wilful as to deprive him or his representatives of the benefits conferred by the Act upon him or them? This question has recently been discussed by the House of Lords in the case of *JOHNSON v. MARSHALL, SONS & Co., LTD.* The facts of that case were as follows:—The appellant's husband was a workman employed by the respondents. He was found fatally injured in a lift on the premises of the respondents. The lift was not loaded, and on the lift there was a notice to the effect that no one was to use it unless in charge of a load. The County Court judge gave judgment against the appellant on the ground that the injury was caused by his serious and wilful misconduct. The Court of Appeal reversed that decision, and the House of Lords have upheld the decision of the Court of Appeal. It is clear from the words of the Act that the decision of the House of Lords is correct, because under the Act the employers are obliged to prove that the accident was attributable to the serious and wilful misconduct of the workman. In this case the only thing proved was simply the fact that the man was found fatally injured in an empty lift to which was affixed the above-mentioned notice; and as Lord ROBERTSON said, nothing was really known as to why or how the man came to be in the lift. The other Lords, however, were inclined to base their decision upon a very large interpretation of the meaning of the words "serious and wilful misconduct." The Lord Chancellor said:—"No doubt it was misconduct to enter the lift when not in charge of a load, for that was a disobedience of orders lawfully given. It was 'wilful' in the sense that the man presumably entered of his own accord, but the word 'wilful,' I think, imports that the misconduct was deliberate, not merely a thoughtless act on the spur of the moment. Further, the Act says it must be 'serious,' meaning not that the actual consequences were serious, but that the misconduct itself was so. If a servant was found once using the front door instead of the back door, contrary to orders, it would be misconduct no doubt. Could anyone say it was serious misconduct? So here the lift was intended for use by workmen in charge of a load, forbidden by workmen not in charge of a load. The offence was not that the man used it, but that he used it without a load. I cannot agree that a lift is an appliance so dangerous that the use of it, when believed to be in a proper condition and intended for use, does in itself amount to serious misconduct." Similarly,

Lord JAMES OF HEREFORD said, "If there was a load in the lift the danger of its use could not be diminished—possibly it might be increased. No result producing injury to anyone could be anticipated by the use of the lift by the individual workman." It would therefore appear that in order to exempt the employer from liability the workman's act must be both deliberate and of such a character that any one could see that the doing of it was attended by serious risk. "The class of misconduct," said Lord JAMES OF HEREFORD, "might well be represented by such instances as if a workman, whilst working in a mine on certain seams of coal struck a match and lit his pipe, or if he walked into a gunpowder factory with nailed boots, refusing to use the list shippers provided for him." The deliberate breach of a rule made by the employer, even though the breach of the rule (as was decided in *RUMBOLL v. Nunnery Colliery Company*) amounted to an offence against the Coal Mines Regulation Act, 1887, is not necessarily serious and wilful misconduct within the meaning of the Act, because the immediate consequences of breaking the rule will not probably be serious. It seems to us that this interpretation of the words "serious and wilful misconduct" goes far to render the effect of these words nugatory. If employers, responsible for the safety of their works and workmen, make rules of discipline, it is difficult to say that it is not serious and wilful misconduct to deliberately disregard them. As Lord ATKINSON well put it in this case:—"The necessity which undoubtedly exists for the strict observance of rules and regulations amongst the hands engaged in factories and other establishments where machinery is used, and the grave dangers which might result if a general laxness of discipline were permitted to prevail, tend to render important, breaches of rules adopted for the conduct of business which in other places and under other circumstances might fairly be regarded as trivial." It may be that it is not every breach of a small rule which will amount to serious and wilful misconduct. But it may equally well be that systematic breaches of small rules may lead to the breach of more important rules; and, regarded from this point of view, some breaches of small rules may amount to such misconduct. As the law stands the employer may make his rules; but though he is the best judge of the rules essential for the conduct of his business, he has no means of bringing before the Court all the circumstances of his business, without a knowledge of which it is impossible to fairly decide whether a breach of any, and if so of which, of his rules will amount to such serious and wilful misconduct that it will deprive the workman guilty of breaking them of his right to compensation. The Court, knowing little of the business, decides each isolated case on the facts. It cannot consider the general bearing of the rules and the possible consequences of continued breaches. What is wanted is some form of procedure by which an employer could get from a competent Court a declaration that certain of his rules are so important that the breach of them will be considered serious and wilful misconduct of the workman. Such declaration ought to be made either if the breach of the rule is obviously dangerous, or if a set of rules are so systematically broken that a continuance of the practice would tend to a general laxness of discipline. Such declaration should of course be notified to the men, who should be represented in proceedings taken to get such declaration. As matters at present stand it is wholly impossible to say whether the Courts will hold any particular breach of any particular rule to be serious and wilful misconduct within the meaning of the Act. And it is clear that this uncertainty must go far to render useless the single clause inserted in the Act for the protection of the employer. We hear much of amending the Workmen's Compensation Act in the interests of the men. Some such amendment as this is obviously needed in the interests of the employer.

FLOWERS AND DECORATION.*

WHEN BACON declared that in the stages of civilisation the appreciation of architecture and the power to "build stately" came before the ability to "garden finely," thereby showing the latter to be the higher refinement, he was not thinking merely of the setting out of the 30 acres which should be the minimum size of the setting for a noble house, for he expressed the opinion that "in the royal ordering of gardens there ought to be gardens for all the months of the year, in which severally things of beauty may then be in season," and he gave a list of the plants most suitable for the various months of the year. The lavish outlay which would result makes the adoption of BACON's theories impossible to the majority of people. Nevertheless, there has been no decline in the popular love of flowers. On the contrary, it has increased.

The instinctive pleasure felt by man in looking at the works of nature inevitably made its imprint on his artistic efforts, and most especially in architecture. The Egyptians saw the lotus, the papyrus and the palm from early childhood, and the forms became part of their lives, which lacked all the multitude of objects flooding the present-day juvenile mind. Assyrian ornament was even more limited. During subsequent centuries the same process has been in operation until it has reached a higher development than ever before, and has created a necessity for such a book as "Decorative Plant and Flower Studies." Miss FOORD produced in 1901 a series of forty coloured plates intended to serve as practical working studies for artists and designers. Although in her drawings of flower forms she was rigidly exact, it was never done with a view to satisfy the botanist or the horticulturist. The necessity of supplying full details of all the parts of the plant prevented any great sacrifice of exactitude for the sake of decorative effect.

Such a book as "Decorative Flower Studies" has the obvious fault of seeming incompleteness. It is impossible that everyone should be contented with a selection of any forty subjects when there is such a vast number to choose from. Consequently Miss FOORD has produced a second series of plates. We expect that there will be a demand for a third and a fourth. The individualistic character of the work is suggested by the fact that although well-known designers, art masters and others were asked to contribute suggestions, Miss FOORD "felt very strongly the difficulty and undesirability of drawing subjects which, while suggesting beauty to some others, have not perhaps appealed in the same way to me, so that through me they carry no message. On the other hand, I have included certain flowers which may have been deemed unimportant, but whose decorative value has impressed me in the fields and hedges and in humble kitchen gardens." For instance, the meadow cranesbill grows wild in the British Isles in fields, hedges and waste grounds, and is a plant which few would regard as a source of inspiration. The corn sow thistle is said to be so familiar and so commonly slighted as an undesirable weed that, perhaps because of its very abundance and familiarity, its beauty is but little recognised. "Yet few of our wild flowers are more perfect in graceful form, not merely in the flowers, but in the beautiful symmetry of the buds, and especially the closing blossoms, and in the variety of line in the tall upright stem and the long undulating spiny leaf." The words are amply supported by the coloured plate showing the head and flower of the plant, a general sketch of it, and the studies of its growth and detail. Barley is scarcely less familiar, but it possesses more obvious picturesque possibilities than the thistle.

Miss FOORD has had the same intentions in preparing the second series as the first; the studies are in no wise offered to students as a substitute, relieving

them of the necessity for drawing directly from nature. They will serve as models and should be incentives to craftsmen to bestow an infinite care on preparing for future work. The book has considerable use for the practised designer, who may be at a loss for a suitable *motif* and be temporarily unable to make independent research. The authors of the books usually consulted heretofore in such an emergency have been ignorant of the special needs of such a man and can rarely afford satisfactory assistance. The methods adopted by Miss FOORD are thus described:—

It is not the aim of these drawings to give a naturalistic pictorial view of the plant, but rather that by simple and severe treatment of line the whole strength, delicacy and character of the form should be expressed, as is most necessary for all practical purposes, retaining as much as is possible of the grace and charm of the flower; the colour being merely implied or suggested by flat washes which should give an impression of the subject as seen in light and air, and not merely a map of the local colour. Care has been taken to make the sketches of detail as full and complete as possible, and in giving a small drawing of the whole plant, to find a typical example; this, however, was not always easy to determine, plants of the same species varying so much in character and growth under different conditions. In all cases the subjects are drawn as they grow, the line being absolutely as in nature, such decorative effect as they may have being due to careful selection and placing on the page and not to any sacrifice of the form, and where any adjunct is given it is given not merely to form a pleasing page, but to show further the habits and scale of the plant in its almost invariable environment.

Each of the forty subjects is accompanied by an explanatory account calculated to arouse an intelligent interest in the mind of the reader. The endeavour to assist the designer has prohibited anything in the nature of botanical technicalities and inspired the printed matter with a charming personal element. Barley, or *Hordeum*, was largely used by the Roman gladiators, who were in consequence known as *Hordarii*. From this source we derive the word "horde." The foxglove, it is suggested, was called originally "folks' glove," or "the fairie's glove;" that name is among a list of plants made at the time of EDWARD III. Another explanation is that it commemorates FUCH, a German botanist of the sixteenth century. The broom is found in Mediæval decoration and was frequently introduced in heraldry. French pilgrims adopted it as a token of humility. Perhaps it was an artist of that country who represented it on the tomb of RICHARD II. in Westminster Abbey, where the plant is shown with empty pods. The Hollyhock was familiar to Greeks as well as Romans. PLINY described it as "that rose which hath the stalk of a mallow and the leaf of a pot-herb." The oleander was a favourite flower in both countries. The arbutus or strawberry-tree is found in Southern Europe, and is rarely seen so far north as this: an exception is the south and west of Ireland, where it is plentiful. It may have been brought over by the monks of Muckross Abbey, near Killarney. A more poetic explanation is found in a Mediæval legend which states that the plant was mysteriously deposited at the feet of an Irish monk in Kerry who had fallen to sleep, grieving for the happy days he had spent in a Spanish monastery.

Miss FOORD is, in addition, essentially practical, and she has regarded her forty subjects from that standpoint, giving to each a brief descriptive note in simple words, mentioning its appearance and growth and any peculiarities. Nothing is superfluous. The page of details is conspicuous for its clearness and arrangement, avoiding the frequent fault of overcrowding. The same spirit marks the coloured plates, which, we are told, have been reproduced in Paris by a stencil process, under the direction of M. E. GRENINGAIRE. Some may see an advance on the high standard of draughtsmanship attained in the first series. At any rate, no one can gainsay their claims to beauty and the beneficial effect the book may have on the applied arts

* *Decorative Plant and Flower Studies, for the Use of Artists, Designers, Students and Others.* By J. Foord. (London: B. T. Batsford.)

THE NEW SESSIONS HOUSE, OLD BAILEY.*

THIS, the latest notable addition to the remarkable buildings of the City of London, has recently been the subject of private views to various bodies, and on Thursday, the 8th inst., the citizens of the ward of Farringdon Within were invited by the Alderman, Deputies and Representatives in the Court of Common Council, and were received by Mr. Deputy Cuthbertson and Mr. Councillor Ritchie, chairman of the City Lands committee.

As a monument of English architecture at the beginning of the twentieth century the New Sessions House occupies a very high position and adds largely to the reputation of the architect, Mr. E. W. Mountford, less perhaps for the success of the external treatment, which, it must be admitted, is somewhat open to adverse criticism, than for the masterly planning and the interior effects, enhanced as these are in a remarkable degree by the collaboration of great decorative artists in painting and sculpture—Sir W. Richmond, R.A., Professor G. Moira and Mr. F. W. Pomeroy, A.R.A. There are few finer pieces of architecture in England than the central hall on the first floor, or court level, with its grandly-domed square compartment in the middle and two square wings on either side, also covered with domes. In these wings are the work of Professor Moira and Sir W. Richmond, the former having painted the decorative subjects in the three lunettes, that at the southern end representing Justice seated before the Cathedral of St. Paul and surrounded by prominent men of the day, whilst those at the sides have for their subjects, on the one hand, Moses as the founder of ancient law, and, on the other hand, King Alfred as the first lawgiver of England. These decorative pictures were painted by Professor Moira in his studio and then fixed in position. Sir W. Richmond, on the contrary, is even now engaged on his share of the work in the lunettes of the northern wing, and is painting on the actual wall surface *in tempera*. One lunette only is practically finished, the subject being supposed to be women and wine, showing a group of dancing girls with garlands. We have not heard what subjects are intended for the remaining lunettes, but presumably they may also be associated with the primal causes that lead prisoners to the courts below.

On the pendentives of the great central dome is seen the grand sculpture of Mr. Pomeroy, work that will maintain his position amongst the great sculptors of all time as long as it remains in existence. The subjects in the four pendentives are Justice, Temperance, Mercy and Charity, and were sculptured in position out of the solid Ancaster stone used in the construction, and under especial difficulties caused by the dim light that the presence of the builders' scaffolding entailed. Mr. Pomeroy is to be congratulated on the skill that, in the face of great technical disadvantages, has enabled him to produce such remarkable work.

Not only has Mr. Mountford brought into collaboration with himself, with happy results, great exponents of the sister arts of painting and sculpture, but he has carried out in the interior of the New Sessions House an architectural scheme of colour decoration in marble which is one of the most striking achievements of our time.

It has been suggested by some critics that the ground-floor hall is not well-lighted, but even on a dull November day, late in the afternoon, the light appeared to us ample for the purposes of the hall and its adjacent corridors, that of approaches merely to the various parts of the building. This result is obtained by the use of light-coloured marbles, Vedrasse and Hopton Wood, in alternate bands for the wall lining. For columns on this floor Tinos marble with caps and bases of bird's-eye, Verd Antique and Cipollino are used. Bird's-eye is also employed for architraves and door heads. In the refreshment-room, Breche Sanguine, Vedrasse and Corallo are the marbles employed. In the principal

great hall on the first floor, which is amply lighted, a darker scheme of colour is adopted. Here Cipollino is used for wall-linings, with monolith columns 16 feet 4 inches long and 2 feet 4½ inches diameter, also of Cipollino. Relief is obtained by panels of Pavonazza and contrast by a plinth of Verd Antique.

The *raison d'être* of the whole building is, of course, the provision of courts for the trial of criminal offences. Of these there are two smaller and two larger, placed symmetrically on the first floor and approached by the public concerned from the great central hall. In all the courts oak joinery prevails throughout, furniture, fittings and structural woodwork being all of beautifully executed workmanship, adorned with carving by Mr. Gilbert Geale.

All the adjuncts, waiting-rooms for witnesses, rooms for juries, judges, lawyers and officers are architectural studies of good design and excellent workmanship; even the tables and seats in the prisoners' cells are specially designed.

A notable installation of the "Plenum" system of ventilation has been carried out with the help of eight large fans, heating pipes, filters and a well-arranged provision of ducts and shafts.

As befits a modern building numerous lifts have been provided for the use of various sections of officials and public who may be engaged in the business to be transacted.

In short, the New Sessions House may be said in truth to be an epitome of the best modern work of architect, painter, sculptor, craftsman, contractor and engineer.

SOUTH AFRICAN WAR MEMORIAL LIBRARY, TRINITY COLLEGE, GLENALMOND.*

THE library which was formally opened by Lord Roberts, V.C., on October 20, has been erected to the memory of those eleven "Old Glenalmonds" who, among the 105 serving in the South African campaign (1899-1902), died in their country's service. Their names, recorded on the mural tablet previously unveiled in the school chapel by Lieut.-General Sir Ian Hamilton, K.C.B., D.S.O., are as follows:—W. H. Dick-Cuningham, Lieut.-Colonel commanding the 2nd battalion Gordon Highlanders, died January 7, 1900, of wounds received in action at Ladysmith on January 6; A. F. G. Foulerton, Major 1st Leinster Regiment, died January 3, 1901, at Vreda; C. W. P. Dalzell, Lieut. Royal Artillery, died December 7, 1900, at Pretoria; A. J. C. Murdoch, Lieut. Cameron Highlanders, killed in action at Nooitgedacht, December 13, 1900; A. B. Coddington, Lieut. Essex Regiment, killed in action at Driefontein, March 10, 1900; K. Z. P. Macaulay, Lieut. Loyal North Lancashire Regiment, died of wounds received in action at Middleburg, January 30, 1901; D. E. Guthrie, Lieut. Imperial Yeomanry, died at Mafeking on February 2, 1902; H. Motum, Second Lieut. Donegal Artillery Militia, died at Lindley, January 14, 1901; G. R. Peddie-Waddell, Trooper Imperial Yeomanry, died at Germiston, February 8, 1901; W. Frost, Trooper 2nd Canadian Mounted Rifles, died of wounds received in action at Diamond Hill, June 12, 1900; A. B. Moncur, Trooper Brabant's Horse, killed in action.

The work of clearing the ground was commenced in November 1904; a memorial-stone was laid by Sir Ian Hamilton in August 1905, and the work was completed in July 1906. The cost of the library, exclusive of the classrooms, has been 2,500*l*. The Council selected a splendid site on the south side of the great quadrangle, and helped to increase the height and dignity of the building by adding to the scheme two classrooms, which form the ground floor while the library occupies the whole of the upper floor. The building is placed midway between the school chapel and the warden's house, and provision is made for eventually connecting these buildings by means of a one-storey

* See Illustration.

* See Illustration.

cloister, according to the original design of the founder of the college.

The entrance hall, which forms part of the projected cloister, is paved with stone, and has five archways in its stone walls; an entrance archway under the oriel of the library, two for the cloister, one leading to the well-equipped classrooms, and another on the circular tower staircase, by which the library is approached.

The library proper is an apartment 60 feet long by 20 feet broad, with 18 feet between floor and wood ceiling. It is divided into three portions: the first, which is lighted by an oriel window giving upon the quadrangle, is allotted to the newspaper readers; the centre portion contains four "carels" (bays) for study, each equipped with a table and two benches; the southern portion contains the magazine tables and benches, and is lighted by three large south windows. The walls are covered with bookcases to the height of 7 feet, and six double bookcases, about 8 feet long, project into the central portion, forming the "carels" mentioned above. A carved wood screen carried from wall to wall above the bookcase line, forms a division between the newspaper-room and the other portions.

The greater number of the shelves are movable to allow the storage of books of various dimensions; glazed locked bookcases are provided for valuable books of reference. The shelves have capacity for 14,000 volumes.

The walls are built of local sandstone, and the roof is covered with Craiglea slates from the neighbouring quarry. Kauri pine is employed for the bookcases and other finishings, while oak is used for the tables, benches and reading-desks of the library, and pitch-pine for all the floors. The lighting is by electricity throughout, the heating by steam. The foul-air shafts are carried to the ridge, while plentiful inlets of fresh air are arranged round the walls. The glazing is executed in steel-cored leaded quarries. The building was designed by Mr. A. G. Heiton, architect, Perth.

SELBY ABBEY.

THE executive committee of the Selby Abbey Restoration Fund met on Saturday in the sacristy of the abbey under the presidency of Lord Wenlock.

The Bishop of Beverley, at the outset, moved that the committee confirm the appointment of Mr. J. Oldrid Scott as their architect, and this was unanimously agreed upon.

Mr. Scott, in replying, said it had always been a pride and delight to be connected with that beautiful abbey, and no effort should be wanting on his part to bring it back as far as possible to the beautiful condition in which it was before the disastrous fire.

The appointment of Mr. Searle as clerk of the works was confirmed, and the committee sanctioned the work of "shoring," which had already been carried out to the arches of the choir and other work at an expenditure of about 200*l*.

Mr. J. Oldrid Scott (the architect) addressing the meeting as to the work desired to be done, said that it seemed to him that one part of the work they ought to undertake as soon as possible was the covering in of the building from the weather. The old roof had absolutely gone; practically there was no timber left, so that the roofing would have to be new. This could, however, be tendered for by builders. He suggested that surveyors' quantities should be at once taken out for the roofing of the building. It was stated that the quantity of lead collected in the debris was worth about 600*l*.

It was decided to at once instruct the architect to prepare plans and specifications for the complete roofing of the church, for the external roofing of the choir and for the temporary roofing of the tower, and to obtain estimates from the builders whose names had been placed before the committee.

Mr. Scott reported that he, together with the clerk of the works and Mr. T. S. Ullathorne, of Selby, had been over to the Rev. Benjamin Hemsworth's quarry and had examined the stone there, which was admirable, and would answer the purpose as well any stone they could get. It was a very fine gift of Mr. Hemsworth's, and he hoped the committee would decide to accept it. Lord Wenlock moved

that they accept the stone, and give thanks to the Rev. Benjamin Hemsworth for his very generous gift. The motion was passed.

The Chairman announced that 10,000*l*. was the amount of work which the committee had sanctioned so far.

It was decided that application be made by the chairman and secretary in the name of the committee for a faculty to rebuild and restore the fabric and its furnishings as they existed before the fire.

The repairs to the columns and arches of the choir and the Lathom chapel were entrusted to Mr. T. S. Ullathorne, of Selby, who had assisted in the restoration of the church on a previous occasion.

THE EDINBURGH MUNICIPAL COLLEGE OF ART.

SOME supplementary particulars have appeared in the *Scotsman* of the scheme now under consideration for the establishment of the Edinburgh College of the Fine Arts and School of Decorative Arts and Crafts. In addition to the main points which we mentioned briefly last week, the report suggests that, in conjunction with the four completely appointed sections of painting, sculpture, architecture and decoration, there should be, as "common necessities," a cast gallery, a museum, library and lecture theatre, *plein air* glass studios for the study of animals and outdoor effects generally, and various other accommodations such as are now considered desirable in modern schools of art. Although the scheme does not reproduce any existing institution, it follows rather the best continental schools than those at home in standard of requirements, and is the outcome of a study of establishments at various centres, such as Paris, Berlin and Brussels. The scheme is largely based on a programme and sketch plans submitted by Mr. Macgillivray, R.S.A., a member of committee. The block plan shows approximately a parallelogram which in its long axis lies oriented about east and west, following closely the northern boundary of the site. The length over all is about 420 feet, the average width about 140 feet. The form it is suggested the buildings should take is, roughly, that of a hollow square, divided at the middle by the entrance hall, museum and cast gallery, centred north and south. This results in the formation of two courts, one on the east side of the central block measuring 140 feet in length by 70 feet in width, and one on the west side 130 feet long by 50 feet in width.

As far as circumstances and the exigencies of construction allow it has been thought desirable to localise the various sections of the arts in fairly defined and suitable quarters of the building. Thus the space and studios allocated for the art of painting occupy the whole of the north-east quarter of the plan, and have the advantage of an almost true north light. Similarly, the space and studios for sculpture take up the north-west quarter of the plan, and receive a light which, on summer afternoons, would be almost too westerly for the painting section. Architecture and decorative painting occupy the south-east quarter of the plan—the whole of the upper floor at this part being apporportioned to architecture and the ground floor to decorative painting and elementary design. Public offices, general accommodation for the administration and staff, &c., occupy the two floors of the south-west quarter. By this scheme the lecture theatre will be most conveniently placed at the east end of the block, near the sections requiring to use it most frequently. Over the sculpture studios are shown a series of seven small studios for post-graduate students and a space for a photography class. The library is placed at the centre over the entrance hall. The plan also shows two common rooms for students, one for each of the sexes. They are placed one on each side of the central block near the entrance. In each of the courts there is a glass pavilion. That in the east court is for painters to practise group painting with open-air effects. The one in the west is for the study of animals by sculptors and painters. A conservatory for plants is attached to the decorative section on the outside of the south-west quarter, facing the sun. By way of explaining the amount of space required, it is said that with a view to the greatest efficiency it is of high importance that the studios, rooms, &c., for each department of the institution should be specially designed and equipped for its special work, so that those desirous of acquiring knowledge in more than one department may be afforded every facility. On the plans submitted, taking the studios and classrooms by

themselves, and leaving out such general matters as museum, lecture theatre, library, glasshouses, corridors, staircases and offices, the plans provide superficial area of classrooms equal to 30,000 superficial feet. Taking as an allowance per student, say, 40 feet, there would in this space be accommodation for 750 students; and this at three relays per day would represent 2,250 students. The estimate of the number of students who would probably attend the school is 2,006, made up as follows:—From the Royal Institution, 456; from the Heriot-Watt College, 450; teacher-students, 1,000—total, 1,906; allow for probable increase, say 100—2,006.

The Lord Provost's committee of Edinburgh Town Council have had under consideration the report of the art school committee, recommending that the whole of the Cattle Market should be set apart for the purposes of the school, the estimated cost of which is put at 50,000*l*. The committee recommend general approval of the report, and the town clerk was instructed to apply for a share of the accumulated funds of the Board of Manufactures. It was also agreed to appoint a deputation to wait upon the Secretary for Scotland, and place before him the claims of the city for a satisfactory grant from the fund in the hands of the Scottish Education Department.

An agreement has been entered into among the different parties. Assuming the total expenditure to be 70,000*l*, the Education Department of Scotland will contribute 30,000*l*. and the Scottish Office 10,000*l*. The Town Council's share is fixed, therefore, at 30,000*l*, of which half is represented by the value of the cattle market site, leaving 15,000*l*. to be raised out of the rates or by voluntary effort. The important point is that it is a *pro rata* arrangement, each undertaking hanging upon the other, and if the Town Council fail to provide the stipulated portion, the Government contributions will be diminished accordingly. The surplus from the Board of Manufactures will be drawn upon for the 10,000*l*. to be given by the Secretary for Scotland.

ROYAL SCOTTISH ACADEMY.

At the annual meeting of the Royal Scottish Academy held on November 14 the office-bearers were elected and the Council declared for the ensuing year as follows:—Council—Sir James Guthrie, president; Messrs. E. A. Walton, W. Birnie Rhind, John Kinross, C. Martin Hardie, W. Grant Stevenson and Hippolyte J. Blanc; George Hay, secretary; John Hutchison, treasurer; W. Birnie Rhind, C. Martin Hardie, auditors; W. D. McKay, librarian; E. A. Walton, W. Birnie Rhind, curators of library; J. Campbell Noble, E. A. Walton, W. Grant Stevenson, Robert Burns, visitors of the life school.

The report of the Council is as follows:—

1. The eightieth exhibition was opened on Saturday, January 27, and was closed on Saturday, June 9. It comprised 346 paintings in oil and water-colour, 41 works in sculpture, 68 in architectural drawings, models and photographs of architectural works executed by exhibitors, etchings and enamels. The Council have pleasure in reporting that the increased interest taken recently by the public in the exhibition has been maintained.

2. The banquet took place in the galleries on the eve of the public opening of the exhibition, when the President and Council had the honour of receiving a large and distinguished company.

3. At the statutory general assembly of the Academy, held March 21, R. M. G. Coventry, painter; Percy Portsmouth, sculptor; and James Miller, architect, were elected to the rank of Associate.

4. The librarian and curators of the library report as follows:—As in the two past years, the library was open for a very limited period—six evenings in all—from Monday, November 13, till Monday, December 18, 1905. It is to be regretted that the attendance was less satisfactory than in the immediately preceding years, and especially that the students of the Academy's life class were less numerous represented amongst the visitors. The books, drawings, prints, &c., are generally in good order and catalogued up to date.

The following addition has been made to the Academy's collection of works of art during the past year:—"The Portfolio," substituted for the portrait lodged in 1905, by E. A. Walton, R.S.A. (diploma work).

5. Report of the Visitors to the Life School of the Royal Scottish Academy:—The session of 1905-6 commenced on November 13, 1905, and finished on June 29, 1906. There were 125 meetings of the class, viz. sixty-one evening and sixty-four morning meetings; and the aggregate attendance

amounted to 1,235. The visitors have pleasure in reporting on the satisfactory condition of the life school, in the number of students on the roll, the average attendance and the standard achieved in drawing and colour. The Carnegie Travelling Scholarship is giving an additional stimulus to earnest work, while the President's monthly prize is having a beneficial effect in composition. The Council, after reviewing the works done by the students during the past year, have great pleasure in confirming the opinion of the visitors in their report regarding the earnestness and ability manifested by the students, as shown in their studies when arranged in the galleries. After a careful examination of the studies the Council awarded the prizes as follows:—The Carnegie Scholarship, Peter Munnoch; the Chalmers Bursary, David Alison; the Chalmers-Jervise prize for best drawing from the life, Peter Munnoch; MacLaine Watters Medal, William A. Cuthbertson; the Keith prize for the best work by a student in this year's exhibition, David Alison. The Stuart prize for composition and design was not awarded this year. William A. Cuthbertson, Alex. Bryson Gillespie, Hugh Monro and David Wright are commended for drawing, and Matthew H. W. Whittet is commended for painting.

6. The Council have pleasure in reporting that, by the courtesy of the National Art Collection Fund committee, the *Rokeby Venus*, by Velasquez, was for a short period shown in the galleries of the Academy, and attracted great interest and attention.

7. The Council have also pleasure in reporting that the collection of works of art by the late George Frederick Watts, R.A., O.M., referred to in the report for 1905, was highly appreciated by all art-lovers and others who visited the collection.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

At a meeting of the Birmingham Architectural Association, under the presidency of Mr. A. L. Ball, a paper was read by Mr. Halsey Ricardo on the "Use of Enamelled Ware in Street Architecture." He said that the architect's use of enamelled tiles might be classed for convenience sake into three divisions, according to the purposes for which he used them—either on hygienic grounds, for the purpose of saving or reflecting light, or for decoration. The three divisions blended and shaded off into each other, and sometimes all three objects were obtained simultaneously in one scheme of tilework. He explained in detail the manufacturing of tiles, and said the question of using them externally was made very difficult by the doubtful behaviour of the tiles themselves. It was a common sight to mark great patches on walls where tiles had been and had dropped off, or to find them cracked and discoloured. The underground railway was painfully rich in examples of their failure, and he noted that the linings in the twopenny tube were beginning to discolour. Wet followed by frost, with an imperfect key for fastening at the back of the tile, accounted for the downfall in most cases, while the impure atmosphere of London endeavoured to discolour everything it could not corrode. He referred to what had been done in the past in regard to tilework for the outer covering of buildings in Mesopotamia, in Persia, in Africa and in Spain. They were used as a protective covering, and also for decorative purposes for the exterior of buildings. Many beautiful effects had been produced by their employment. They had been used also for interior decoration. The example might be followed with advantage and profit in our large cities. For half the year our cities were the colour of a dirty cobweb, and the only refreshment the eye got was in the glimpses of the sky overhead, the shop windows and the hoardings. Those latter marked the hunger for colour significantly. They wanted colour in our streets, and he asked why they should not plate their own buildings with tiles. He did not suggest that a man should veneer his vertical section of a street side that served him as his house, and let his neighbour on either side follow or not his novel start, because colour to be effective must be in broad masses. He should like to see whole streets treated in permanent colour. As a beginning in so bold an experiment the scheme might be tried on a detached building standing free, and with some trees about it, to a public building of such a frontage as should be sufficient or display a large mass of plain wall surface. The effect of broad masses of colour would be admirable, and a glazed surface would be advantageous from a health point of view, and would also be very durable. It was easily cleaned and was impervious to the elements.

NOTES AND COMMENTS.

WE have more than once referred to the differences between Mr. KELLETT, a contractor, and the Corporation of Stockport. The matter arose out of the partial construction of a reservoir. The contract was likely to amount to 400,000*l.*, although work only to the value of 75,000*l.* had been executed. The amount paid was 68,154*l.*, a reserve being retained according to the conditions of the contract. In the progress of the works it was discovered that the site was unsatisfactory. This fact was pointed out by the contractor, but was received with scepticism. Mr. KELLETT was informed that he had undertaken to make a dam that was watertight and stable, and to that he would be held. His reply was that what he had undertaken was defined by the drawings. After some time the Corporation decided to put an end to the contract, and Mr. KELLETT brought an action which was to be tried at the Manchester Assizes this week. The Corporation had, in fact, decided to try a different site, and the contractor, it was stated, was kept employed on experimental excavations which would bring him no profit. On the second day Mr. ISAACS, K.C., one of the counsel for plaintiff, said it had been agreed to submit the whole case to the official referee. Mr. PICKFORD, as counsel for the Corporation, said there was no intention of acting unfairly, and that if Mr. KELLETT suffered injury he could recover compensation. Mr. Justice A. T. LAWRENCE expressed his satisfaction, for a technical case of such a magnitude involves all connected with it in a severe strain. The real point at issue is whether the contractor agreed to carry out works which were defined on the plans, or whether he accepted all contingencies in the belief that his ability was sufficient to get him out of every difficulty. The engineer was the late Mr. MANSERGH, and in a letter to the resident engineer he wrote:—"Clause 97 (of the contract) is quite clear; it throws the sole responsibility for the perfect stability and watertightness of the dam on the contractor, and you must say nothing to him which will lead him to suppose that his liability is limited in any way." From Mr. MANSERGH's experience there is reason to suppose that he was not likely to be indefinite about the responsibilities of the contractor.

THE position of civil engineering and the main cause of its popularity was suggested by Mr. DONALD A. MATHESON, engineer-in-chief of the Caledonian Railway, at a meeting of students in Glasgow. Civil engineering was, in his opinion, the art of making a sovereign earn the most interest, and the commercial element was everywhere present in all civil engineering work. The young civil engineer should therefore be taught early, preferably in the school of practical experience, to recognise the absolute necessity of securing durable work and of ensuring economy, not only in the first cost of construction, but also in point of upkeep. The economics of maintenance must be marked on his memory. The civil engineer who had not had practical experience in maintenance was not well qualified to design or to direct the design and construction of works. Sufficiency in strength of civil engineering works was really true economy. But one of the enemies to economy was the difficulty created by water. Nothing was more true than the saying attributed to a well-known Scottish railway contractor of the past—"Ye canna cheat watter." In all civil engineering work judicious first cost and the exercise of skill in properly dealing with water ultimately saved much money in maintenance, and, strange as it might sound, good drainage might be said to be synonymous with good dividend. A penny properly saved in maintenance was a penny rightly gained for dividend. It was not incompatible wit the high professional ideal to say that the making of dividend was one of the chief ends of the civil engineer. Dividends could be made, or at least increased, by sound economy in expenditure in maintenance, and expenditure in maintenance in its turn could

to a large extent be governed by skill in design, judgment in the selection of materials and thoroughness in construction. It could have been pointed out that the great difficulty in dealing with water arose from its unexpected appearance. It may seem easy when there is an irruption caused by the tapping of a spring to say that the danger could have been anticipated by a careful study of geological maps and sections. But not even the geologists have a sufficiently detailed knowledge of subterranean arrangements to impart certainty to their prophecies.

On Wednesday Lord BALFOUR OF BURLEIGH unveiled a memorial of JOHN KNOX, the Reformer, which has been set up in St. Giles's Cathedral, Edinburgh. The sculptor is Mr. PITTENDREIGH MACGILLIVRAY, R.S.A. The features of the Reformer are of such a definite and stern character, it might be supposed that representation of them was not a difficult task. But when the advice of THOMAS CARLYLE was sought about the selection of a portrait for the Portrait Gallery in Edinburgh, he had to be very guarded in his reply, and some of the old portraits were criticised with characteristic scorn. BEZA's woodcut is described as the representation of a gentleman content to take things as they came, if only he was allowed to digest his victuals and sleep in a whole skin. A similar portrait by GOULART, of Geneva, is said to be only a vague hypothesis. The portrait given by VERHEIDEN, a Dutch theologian, which evidently was used by Sir DAVID WILKIE for his *Knox preaching before Queen Mary*, was to CARLYLE the most intolerable figure that exists of KNOX. The Torphigen portrait is held to be the work of a hopelessly incompetent painter, while the portrait in Glasgow University shows an altogether weak and foolish head. The portrait in Holyrood House is now recognised as one of an official architect. One in Hamilton Palace presents not the portrait of the prophet of the Reformation, but of the professional Merry Andrew of the family. Indeed, after reading CARLYLE's letters one can doubt whether it is wise to attempt to represent JOHN KNOX on such uncertain evidence. The sculptor in the new memorial follows the lines of Professor HUME BROWN's portrait, and at least presents a very vigorous divine. St. Giles's Cathedral now contains several interesting memorials of the political and theological battle in which Scotsmen participated.

By an inexplicable oversight it was stated last week in the note on the new War Office that Sir HENRY TANNER has co-operated with Mr. CLYDE YOUNG. The official information was before the writer, and it stated what was generally known among architects, that Mr. CLYDE YOUNG had the advantage of the experience of Sir JOHN TAYLOR, K.C.B. We regret the error and trust it will cause no annoyance.

HOUSE, WAKEGREEN ROAD, MOSELEY.

THIS residence now being completed is situate in Wakegreen Road, Moseley, Birmingham. The site is most picturesque, overlooking a well-timbered valley, the autumn tints of same being at the present time most pleasing. The architect is Mr. J. BREWIN HOLMES, Exchange Buildings, Birmingham; the contractor, Mr. E. CROWDER, of Birmingham. The total cost of buildings, fencing, laying-out grounds, &c., is 2,000*l.* The interior oak panelling of the hall and dining-room is the work of Messrs. WARD & CROFT, Barwick Street, Birmingham.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. H. T. Hare, vice-president, in the chair.

Mr. A. E. HENDERSON read a paper on :—

The Cræsus (Sixth Century B.C.) Temple of Artemis at Ephesus.

The purpose of the lecturer was to describe the actual remains found and the fragments which remained of the Cræsus (sixth century B.C.) Temple of Artemis at Ephesus, uncovered and surveyed during the British excavations directed by Mr. D. G. Hogarth in the autumn of 1904 and the spring of 1905, also to place before the Institute his suggested restorations. He began by stating that the Cræsus Temple was the fourth structure on the site, and that there were remains of yet another (a fifth) called "the Hellenistic Temple," over and beyond it, besides large concrete masses which were late Roman or early Byzantine, sinking low down into the foundations and rising to about two metres above the Cræsus pavement. He showed a large plan and sections of the earlier temples, but did not explain them, except to say that they increased in size as one superseded the other. Yet the Cræsus cella walls easily enclose the last of the three. The general plan shown gave all the remains which were uncovered, which practically amounted to all that was left of the Cræsus and Hellenistic temples. Before commencing his survey the lecturer was instructed by the late Dr. Murray to measure accurately every portion of Cræsus pavement, and this he believes he has faithfully fulfilled. He showed how the Hellenistic foundations extended beyond the earlier temple, and showed the position of a brick drain beyond the outermost step, which had been covered by the marble paving of the court, also where the step itself survived and the large pier foundations to support the podium steps. He further showed photographs of the temple as excavated, and described the difficulties with water, which were successfully overcome. The Cræsus Temple was then taken in detail. The central basis of the three earlier structures (from and near which the treasure was extracted, now on view, on the presentation of a visiting-card, in the Coin Department of the British Museum) was raised and reused as the centre. The lecturer pointed out that the foundations were practically double the length to the width, that the walls had separate foundations, but not the columns, and he showed a conduit which passed beneath the west doorway. Foundations to the steps to the Perron, or western platform, were shown both in section and by a photograph. The paving was then described, how it was laid to no pattern, but how beautifully accurate all the joints were made. The remains of the walling to the cella were then described, how markings were found indicating the position of the north wall, and the impression of the east wall in a mass of concrete, and how by the portions remaining the south wall could be traced from the east cross wall to the south-west anta. This walling was shown to vary somewhat to the walling left of the west wall, which shows the position of the north reveal of the great west portal. Other portions of the superstructure were a plinth and lower base surrounded by Hellenistic foundations lying to the north-east. A plinth—greatly mutilated—to a column directly south of the south-west anta, and half a plinth lying directly to the south-west of this; and, lastly, a large mass of Hellenistic foundations, which was not explored, but it showed that settlements had occurred to the Cræsus Temple before these foundations were laid. He then went on to describe the fragments of architecture which came to light. He began by stating that the outer rank of columns to the peristyle had larger plinths than the inner rank, and that all had a circular lower base about two metres in diameter, formed of three orders of double astragals separated by two filleted scotias. Many varieties of upper or torus bases were found; these he illustrated; the most usual type was parabolic in section, with horizontal flutings separated by V-grooves. Another variety was specially pointed out; the upper outline was divided up horizontally by quirked beads. The space between these in the upper half had flutings, but the lower half had reedings, the upper part being concave and the lower convex, which, as shown in the photograph, looked extremely substantial. No complete drums of columns were uncovered, but twenty various fragments were examined and measured; it was found that fourteen of these gave forty-four, three gave forty, and three gave forty-eight flutings to the circumference. He placed the forty-four in the outer rank, the

forty in the inner, and the forty-eight he did not place, as they were of an entirely new type; the flutings were alternately wide and narrow, one torus base was found to be of similar design. Enough portions of capitals were found for the lecturer to combine these to make an entirely new drawing. He also stated that the batter outwards of the volutes was for the optical purpose of counteracting the excessive foreshortening as seen from the ground, and he mentioned that in Hellenistic times the spiral was contracted horizontally and lengthened perpendicularly for the same optical purpose. The spiral to the Cræsus Temple was found to be a simple unwinding curve which can be easily set out. A suggested restoration of a rosette capital was shown, which proved to be somewhat different from the one erected in the British Museum, a leaf and dart echinus took the place of the usual egg and dart, and pointed leaves instead of elliptical were given to the rosette, besides other minor alterations. Nothing which looked like an architrave could be found, but the bed-mould and corona were both important additions, besides several fragments of the large sculptured cymatium gutter.

The lecturer then dealt with his restored plan; he showed the data from which he planned the columns placed round the peristyle and in the pronaos; he then described his restoration within the cella enclosure, how he placed the columns along the facing found in the foundation, and he placed one column (the 127th) in the centre behind the basis, thus making the naos twice the width of its aisles. He suggested that the thirty-six sculptured columns could be accounted for by placing them in the front rank of the ends, and one at each end of the flanks, the remainder lining the central walks of the pronaos and porticum. He found that the whole length of the temple platform was 109 metres 20 centimetres, and the width 55 metres 10 centimetres. He found that measuring from the central axis to the north and south faces of the columns in front of the antæ was the same distance practically (about 12 metres 30 centimetres) as from these faces to the north and south faces of the outermost columns, thus dividing the façades into four equal divisions. He then showed an elevation with the height from the pavement to the underside of the architrave of this same dimension, viz. one-fourth the length of the façade. This height makes the order work out at about 8 diameters. He made the entablature a quarter of this, the pediment rose another three-eighths, and with the surmounting acroteria made the proportion of superstructure to the colonnades come to as 3 is to 4. He suggested that the roof was of tiling and timber, which would then account for the total destruction of this temple by the arson of Herostratus.

Mr. D. G. HOGARTH, who proposed a vote of thanks to the author of the paper, said he was himself truly grateful to Mr. Henderson for the assistance rendered during the work of excavation by his knowledge of technical details. The speaker in his supplementary remarks to the paper paid a tribute to the memory of the late Mr. J. T. Wood, because of the energy, persistence and acumen the deceased had shown in discovering the temple. No one, he said, could speak too highly of Mr. Wood, and all the world had reason to be grateful to him for the recovery of those remains which had been hidden for centuries under 18 feet of earth. Those who visited the place after Mr. Wood had profited enormously by what was done by him. The speaker said in the recent excavations they found the work of clearance undertaken by Mr. Wood had been excellently done in spite of many difficulties, and he had also laid bare the pavement of the temple described in the paper. They finally found Mr. Wood had most creditably searched the earth which had been removed from the remains. Considering the age in which the work had been undertaken, Mr. Hogarth thought the excavations by Wood could not have been better. The importance of the discoveries was not then realised, and Mr. Wood failed to do himself justice in his book on the Temple of Ephesus, and for some reason he never published drawings or plans; indeed, the speaker thought it was almost true to say that he ignored the archaic temple which he had discovered. Wood believed he had discovered one temple, whereas beneath the stratum were the remains of three earlier ones. The speaker said one reason why Wood probably would never have discovered them was that he ascertained his records by pitting, and from personal experience, notably at Knossos, the speaker had found that procedure to be fallacious.

Mr. CECIL SMITH seconded the vote of thanks, and said it was always a reproach that the work of excavating on the site of the temple had not continued after Mr. Wood's death.

The Austrians made application, but the right to investigate was refused them. The excavations described by Mr. Henderson would be the last undertaken. The local officials had compelled them to fill in the foundations, and the site was soon covered with water and debris.

The CHAIRMAN joined in the vote of thanks, and the meeting terminated.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE opening meeting of the Edinburgh Architectural Association was held on the 14th inst. Mr. Hippolyte J. Blanc, R.S.A., the president of the Association for the third time, delivered the inaugural address.

Mr. Blanc at the outset recalled the fact that their Association was founded about fifty years ago, and that, with the exception of the London Architectural Association, it was believed to be the oldest Architectural Association in the British Isles. As a body of architects its highest aims should be loyalty to the profession it represented and its members, and sound guardianship of the valuable architectural traditions of the city. Though to one moving with the growth of the city the changes in fifty years might not be very noticeable, yet the increase and expansion of the city and its industries were very apparent. Princes Street, the North Bridge, Lothian Road and Shandwick Place had had their frontages as in 1858 almost entirely changed, either by new faces super-applied on the old or by entirely new creations in substitution of the old. Of the original tenements in Princes Street, for instance, very few remained, nearly all having been supplanted by the palatial commercial edifices that revealed the increasing wealth of the citizen owners, through whom the valued rental of the city had been in fifty years increased at least fourfold. In that period nearly 150 public buildings had been added to the city, one-half being churches. In all this advance architecture had not declined, and in the rapid march of sanitary science the profession had proved its fitness to handle the details expertly. Whatever might be the future development of the city, it should be a matter of first importance that the main routes should be direct and wide enough for the increasing numbers of modern speedy conveyances. Pavements in these routes also were required to be much wider, to avoid the unseemly jostling experienced every day in the chief thoroughfares. Tree planting in streets, in the links and in the squares, should not require more than mention. A building could be made to look acceptable, though plain, if its forms were in harmonious proportions; so also could a building be designed richly, if the decoration be judiciously applied upon a well-proportioned body. Before the steady march of commerce sentiment must give way, but to infuse a fair proportion of sentimental treatment in commercial work was not incompatible with the requirements of commerce, and whoever, therefore, disregarded that sentiment was not acting wisely in the best interests of the city. Architects should therefore go with the spirit of the time, though in a thoughtful and scholarly manner, and not be led into some of the distorted expressions of modern eccentricities which, however pleasing as novelties, had a very ephemeral attraction.

The student of to-day had before him, in his daily walks in that city, opportunities of educating his tastes by making himself familiar with those specimens of masterful proportion and detail. Let them compare the thoughtfulness exhibited in Craig's and Ainslie's plans, prepared soon after the opening up of the northern fields of the city for feuing, when the Nor' Loch was spanned by the North Bridge, with the utter disregard of all amenity in the disposition of Morningside Road, Dalry Road and a few others. Why should the private interests of individual proprietors control the amenities (and often destroy them) of streets and roads, which ultimately fall upon the body of ratepayers to use and maintain? Why should not the magistrates have greater control in the genesis of such streets? When the problem of laying out the new town was under consideration, it was prudently determined to submit the whole scheme for the suggestions of architects. The result justified the resolution, and if Edinburgh had nothing else to show than the very successful and dignified Classical compositions in the squares and crescents of the new town, it had enough to justify its claim to be considered a truly Classical city. But of architectural character the later city extensions were mostly thoroughly devoid. The tenement residences had been in some main thoroughfares planted stretch after stretch painfully close, following the original irregular line of roadways, without

the slightest engineering. The resulting effect was anything but elevating to the resident or the passer-by. Why should streets be so closely aligned that opposite neighbours should be enabled to see through each others' windows, and at the same time make the narrow streets prematurely dark by the shadows of the high tenements placed on each side? If in Paris, under modern legislation, streets could be made from 150 to 200 feet wide, affording facilities for every sort of modern traffic and for broad pavements fringed with trees, was it necessary that the extensions of a city like Edinburgh should be laid out as a series of windy lanes? Edinburgh, on account of its hilly ground, demanded even wider avenues than did cities on level plains. Having regard to the irreparably poor appearance of the Morningside Road approach to the city, also of the Dalry and Gorgie Roads, it might be hoped the Corstorphine, Queensferry and Newington approaches might be kept broad, and guarded against the intrusion of anything affecting their present amenity, such as would result from the closing in of tenements. They might take suggestions from the specimens of the new town and a lesson from the experience of London and Paris, and especially the former, where enormous sums of money were being expended to bring back the amenity lost in a previous age of culpable, careless administration.

As in the case of all cities, suggestions of new schemes for improving the city's amenity were continually being made. Princes Street and the Calton Hill were perennial themes for busy minds ever on the outlook. It might be asked, however, with regard to the Calton Hill, could the picture as they now saw it be made more beautiful? Did not the openness of the screen formed by the unfinished national monument appear more pleasing to the eye than would be an enormously solid building apparently terminating the vista? One of the latest suggestions, that of forming a terrace or boulevard on the south side of West Princes Street, was now under consideration. Very wisely, a model had been constructed that the citizens might judge the effect of the suggestion to form a terrace or boulevard on the south side of West Princes Street. The proposal, however, had not taken—and, doubtless, wisely. There was more involved than could be judged from the model. In the West Gardens, the gentle fall from Princes Street Walk and the gradually ascending castle bank opposite, with the broad valley between, formed a unique picture, which could be appreciated only as a whole, not only by the leisurely, but by the ordinary passer-by. To cut off any of the picture, as seen from Princes Street, would destroy it, and the contraction of the valley, by the intrusion of the continuous stretch of terrace wall as seen from the lower walk, seemed very undesirable. A few feet in addition to the present Princes Street Walk, and a more dignified railing, would be an improvement, and at much less cost. Mr. Blanc also briefly touched upon the question of the Usher Hall, expressing his preference for a new building interrupting the present thoroughfare towards Haymarket.

The gift of Lord Leven and Melville for preserving and rendering serviceable and interesting the old chapel of Holyrood was one that was certain to appeal to the best sentiments of the citizens. But no sooner was the gift announced than a crop of suggestions and opinions were daily served up—some welcome, many not. Were not architects yet capable of dealing themselves with matters entrusted to them? Did the medical profession receive from the public budgets of anonymous correspondence when any member had a case to treat? He failed to see the difference. The risk of that premature discussion was that it would undoubtedly restrain the hands disposed to give, with the result that the city would be poorer by being deprived of the chances of increasing its real attractions. No declaration had yet been made by the architect, Mr. Thomas Ross, in whose hands the subject was placed, so therefore they had nothing before them. The gift, however, as a national one could not be overestimated. The history of the chapel was a sacred one. It seemed desirable, therefore, to do whatever was possible, with sacred handling, to save the building from its obvious fate. Total decay would, within a very limited period, certainly overtake the building if the inestimable opportunity was not now taken to arrest it. If it could be shown that wasting and disrepair could be rectified, and the building could be made serviceable by retaining all it possessed of original material, and by having the gaps filled in, there seemed no reason why that should not be done.

Architecture, he maintained, ought to be made a part of

a polite education, but if the public had no opportunity either at school or in after life of being properly directed in the most interesting and most useful study of architecture, how could an intelligent appreciation of an architect's labours be looked for? The remedy should be found in the infusion of a love for architecture at school. Instead of schools devoting so much time during autumn, winter and spring to the sport of football, could not that be varied by a few Saturdays being given up under special experts to an examination of some historic old building? By so sowing the seeds of elementary knowledge, one could look for a new generation qualified to think and act in sympathy with architectural progress. He earnestly hoped the foundation of the new art school, which now had attracted the attention it deserved, would not be long delayed, and that its teaching equipment would be such as would supply a full measure of the clamant needs of the architectural student.

On the motion of Mr. T. Ross, the president was accorded a hearty vote of thanks.

In reply, Mr. Blanc referred to the loss the Society had sustained in the death of Mr. Ballantyne, and it was resolved to send an expression of sympathy to the family.

The secretary, Mr. Colin B. Cownie, intimated that the Council of the Royal Institute of British Architects had arranged to hold their annual meetings in Edinburgh next summer.

AULD BRIG O' AYR.

THE following report by Messrs. Simpson & Wilson has been submitted to the executive committee for the preservation of the Auld Brig at Ayr:—

Acting on the instructions of the central committee, we have again made a careful examination of the whole bridge, and we are confirmed in the opinions expressed in our letter to the town clerk of Ayr, dated August 23, 1905. So far as we can judge, no movement has taken place in the bridge since our first inspection more than a year ago. From the bores which have been put down, it appears that the south abutment and all the piers are founded on boulder clay varying in thickness from 13 feet at pier No. 1 (the northmost pier) to 10 feet at pier No. 3. From what we have seen we have no doubt that the north abutment is founded on rock of some kind.

Boulder clay is a good foundation, and we are satisfied that the present condition of the bridge is not due to the sinking of the piers, but that the weakness is in the structure itself.

All the arches have gone out of shape more or less, the south arch unequally, having flattened on the north side and risen in the centre, while the other three arches have all sunk at the crown, and in so doing have drawn the spandril walls away from the piers.

The movement in the arches is, we consider, due to insufficient and improper haunching, and to the action of water, which has washed out a large proportion of the lime forming the original mortar.

The object of the committee being to strengthen the bridge, so as to preserve it in its present form without in any way interfering with its outward appearance, we now proceed to describe how this can be done. The mode we propose to adopt is as follows:—

1. Point or caulk any open joints in the arches, spandril walls and piers, the pointing being kept $\frac{1}{2}$ inch back from the face of the stones.

2. Excavate two trenches, 3 feet wide and 4 feet apart, at right angles to and between the spandril walls at the centre of each pier and down to the top of the haunching, and fill same with concrete.

3. Excavate trench, 3 feet wide, along centre of roadway, down to the arch and haunching, beginning at the cross walls above described, and working towards the centre of the arch from each side. Before filling this trench with concrete, apply grouting machine to each side along the bottom, so as thoroughly to fill the vacancies in the spandril walls and arch. Fill the trench with concrete up to the level to receive the roadway, and after the concrete is set remove the sand from between the spandril walls, and grout the portions of the arch and outer spandrils not already done.

4. Sink pits, 8 feet by 4 feet, in the centre of each pier, down to a depth of 8 feet below the timber cradle, grouting in all directions as the work proceeds. From the bottom of the pit drive mines, so as to underpin with brick and cement the whole area of the pier and cutwaters.

5. Cover the voids between the spandrils and concrete arches 9 inches thick, on top of which a layer of asphalt is to be laid, the roadway being finished with hornising as at present, making the roadway perfectly watertight.

We propose to begin with the south arch, and work northwards, following up the spandril walls and grouting as quickly as possible.

The parapet walls are much worn and off the plumb, and cannot be made to serve as fences without being rebuilt, although they are safe enough to stand in their present state if protected by unclimbable railings.

SIR ROBERT GEFFERY'S ALMSHOUSES, SHOREDITCH.

THE following memorial has been sent to the Charity Commissioners for England and Wales on behalf of the Society for the Protection of Ancient Buildings, the Metropolitan Gardens Association and the National Trust:—

We, representing societies interested in the preservation of places of historic and artistic interest and of open spaces, desire to address you with regard to the almshouses of the Worshipful Company of Ironmongers, situated in Kingsland Road, Shoreditch.

From advertisements which have appeared in the press and the notice in the garden adjoining the houses, as well as from the letter addressed by you to the secretary of the National Trust, under date October 1, 1906, it appears that the sale of the site and consequent demolition of the almshouses are contemplated.

These almshouses were erected in accordance with the terms of the will of Sir Robert Geffery in the early years of the eighteenth century, and they retain the architectural charm of buildings of that period. In front of the houses and facing the street there is a considerable garden containing fine trees. The houses have all the appearance of being well cared for; they have evidently been reroofed within the last quarter of a century. The chapel has been newly decorated and there does not appear to be any lack of means for keeping the establishment in good order and repair. All the living rooms of the inhabitants appear to look into the garden, and generally it may be supposed that the lot of the residents is not a disagreeable one. There does not seem, therefore, to be any adequate reason for the removal of the houses other than the prospective realisation of a considerable sum of money by the sale of the site.

The Commissioners, however, in announcing their decision in the case of the Trinity Almshouses, stated it to be their opinion that "an increase of income available for charitable purposes is not in itself a sufficient ground" for such changes.

We venture, therefore, to submit that this site is in its present condition of real value, for it provides a building of architectural beauty and historic interest in a district of mean buildings and unattractive warehouses, and a picturesque and well-matured garden which forms one of the very few open spaces in the district.

A part of the site too is occupied by a disused burial-ground, and could not be used for building without an infringement of the Disused Burial Grounds Acts.

The destruction of these almshouses would not only break a valuable link in the chain of history, it would remove from London a standing example of the charity and benevolence of her citizens.

Accordingly, we would very earnestly urge you to refuse your sanction to any scheme which involves the destruction of this garden and these almshouses, nor to sanction any other scheme without holding a public inquiry.

JEAN FRANÇOIS MILLET.

MUCH interest was excited in Scotland by the announcement in the papers of Friday last that "L'Angelus," the famous pastel by Millet, had become the property of a Glasgow collector. It was subsequently stated to have been purchased by Mr. John Reid, an engineering manufacturer, who had inherited a very valuable collection from his father. The following article on the artist appeared in the *Glasgow Herald* on Monday:—

In one of those felicitously phrased and illuminative essays which only the scholarly critics of France seem to have the gift of writing, M. Leonce Benedite, the director of the Luxembourg Gallery, claims that Jean François Millet

is the most extraordinary of all the great figures which have made the nineteenth century famous in the domain of art. However this may be, he undoubtedly stands alone, austere and grandiose, an isolated being, without analogy in the present, without precedent in the past. Before him none would seem to have looked out on this world of ours with eyes so mournfully clear-sighted and so gravely tender; and certainly none has expressed with an eloquence so simple and so pathetic those sentiments which were stirring human societies to their depths at the time that he lived and worked. Millet was, in truth, the man of his work. This work was not merely the expression of an intellectual concept, an artist's day-dream; it does not evoke an imaginary world, some vision of the land that never was; rather is it the outcome of his life itself. And this is the secret of his greatness. He was a son of the soil. As a lad he drove the plough, he tended the cattle; for him seed-time and harvest brought stern toil. Year in and year out he lived the grave and humble life of the peasant. And all the time his soul, aloof, introspective, meditative, brooded on the elemental facts of his surroundings, the aspects and the emotions of the daily existence of the tillers of the earth, so that, when the artistic impulse became too strong to be any longer resisted, it was with a keenly observant eye and a spirit attuned to lofty thoughts that he embarked on his life's career. Millet was, in truth, an accomplished and sincere artist who was also a great humanist. At first, without a doubt (his student days in Paris past), he attempted to produce work that would be fashionable, would please the thoughtless public; but after a few years of effort not to be himself he abandoned this endeavour, and, settling at Barbizon, commenced his real life's work, that unique series of pictures which has been well called "The Epic of the Peasant." Here amid poverty and (only too often) want the strong man persevered with his appointed task; daring at last to give his genius full play, he showed himself the great interpreter of "the cry of the earth," the painter, as he himself said, of "the fundamental side of men and things." Animated by the one dominant idea, in the end he achieved such masterpieces as "The Sower," "The Gleaners," "The Man with the Hoe," and (not least) "The Angelus." In these and in the many other works of like inspiration, grand yet sombre poems of the toilers in the fields, we see the real man, individual and unconventional, with a breadth of outlook and a depth of sympathy all too rare. His gospel was that the artist must feel deeply if he is to paint well, a man must be touched himself if he is to touch others, or else his work, however clever, will never have the breath of life, and he will be nothing better than sounding brass or a tinkling cymbal.

In all his pictures he fastens on one central and fundamental idea, and allows nothing to distract the mind from the principal subject, and he treats every theme with that large simplicity of style, that monumental dignity, which mark the work of the master mind. In these majestic achievements he visualises for all time types which sum up the story of whole generations of toilers—impressive figures which are part of the great and changeless order of existence, close linked by ties that none may break to the changes of the seasons and the beauty of the natural world. It is perhaps in "The Angelus," one of the most famous pictures in the world, that his qualities are displayed in the highest degree. No motive could be simpler than that of this small canvas—a peasant and his wife, who pause in their toil in the wide, open field at the sound of the Angelus bell, and who stand silhouetted against a tenderly luminous evening sky. As they hear the chime they bend their heads in a momentary silent prayer, and so simple and so sincere is the art of the painter that the whole picture seems to evoke the sound of bells heard at twilight—seems to be suffused by a profound pathos and a sense of devotion that envelops the two figures as completely as the atmosphere of evening that permeates the far-stretching landscape. It is a grave, impressive and stately art which can thus convey to the beholder the emotions of the painter, can thrill the heart and stir the soul to quick response.

This little work, now famous in two continents, was sold by Millet for only 1,000 francs, and the story of its growing appreciation and of its travels and vicissitudes subsequent to the time when the artist parted with it is as fascinating as a romance. Space will not permit a detailed account of these mutations of place and circumstance. Suffice it to say that M. Durand-Ruel in a few years time gave for it thirty times the sum that Millet received, and that during the Franco-Prussian war it was vainly offered in Britain for 1,000*l.*, though it shortly after became the property of a

Belgian collector, who paid 2,000*l.* for it. At his sale in 1881 it realised 6,400*l.*; still later the famous connoisseur, M. Secretan, gave 12,000*l.* for it; and when his pictures were dispersed, after a most dramatic struggle between the contestants who were anxious to secure it, it was bought for the French nation, amid a scene of the most intense excitement, for some 22,000*l.* But the Government of the day refused to ratify the action of its representative, with the result that "The Angelus" went to an American buyer and was consigned to the States, where, however, it stayed but a short time, being ultimately secured by M. Chauchard, at a cost of 32,000*l.*, for France. The enormous popularity of these august works of Millet's, alike among critics, public and collectors, is very interesting, affording as it does a typical instance of the triumph of idea over expression, of emotion and thought over manipulative skill, of subject over technique. Millet was a great artist; there is in all his work an austere simplicity of mass conjoined to a quiet harmony of colour, a certain rhythmic quality of design allied to a grave reticence of expression that are wholly admirable. But Fromentin was probably right when he insisted that this most distinguished of French painters was not a technician as we to-day understand technique. There is no doubt as to the enormous power of his work, but at the same time it cannot be denied that his oil-paintings are sometimes laboured in effect, that there is an absence of spontaneity in them, that a certain heaviness and woolliness of touch is evident, and that they lack, as paintings, the lightness and subtlety to be found in the work of many artists without a tithe of Millet's genius.

Indeed, if we want to see the master at his best as a technician, unsurpassed and unsurpassable, it is to his pastels and his black-chalk drawings that we must devote our attention. In such a work as the pastel of "The Angelus" (an exquisitely luminous drawing, suffused with the pearly light and still serenity of evening) are none of the blemishes inherent in the oil-pictures, which are the outcome of a more laborious method of artistic expression, and it is because they possess to the full this quality of freshness and spontaneity that Millet's drawings are often more completely representative of his genius than his paintings. In them the thoughts which filled the great peasant's sleeping and waking hours are expressed with a clearness and directness, an ease and charm which nothing can disturb. In them his noblest qualities are present. His wonderful power of draughtsmanship, his thorough mastery of form, his entirely sufficing gift of suggestion, his tender and profound feeling—each is to be found in his drawings and pastels. And all the passionate sympathy with suffering and toiling humanity, all the loving observation of earth and sky in their various aspects, all the power and pathos of his art are, as it were, distilled and concentrated into his work in this medium.

IVORY IN THE ARTS.—II.*

MY programme includes the consideration of the applications of ivory in the decorative arts, and it was my intention to carry you, if time permitted—by means of illustrations on the screen—through the progress of the art of ivory sculpture in most countries and in all ages, showing especially the beautiful work of the Middle Ages. But I must ask your indulgence for omitting the early periods of this subject, and for confining my remarks to the position of ivory sculpture in our own times. Before doing so, however, I will touch briefly upon one or two intermediate points of interest. I intended to have spoken of the gigantic statues of gold and ivory attributed to Phidias in the great days of Greek art. Of these we have only records and no remains whatever. But the question, if and how the ancients managed to procure large slabs of ivory (and we find also very large ones amongst the consular diptychs and in Mediæval works) is often raised, and some have thought they knew some method of softening ivory. The old alchemists, in fact, give some marvellous and fanciful recipes for so doing. As a matter of fact, so far as our knowledge goes, ivory may be softened and reduced to a glutinous mass, but it cannot be again restored to its original condition. Probably the chrys-elephantine statues were covered with slabs or thin plates of ivory which could be easily bent round to follow the contours. The effect close by would resemble a kind of mosaic, or the leading of the stained-glass windows, but at a great height

* From the Cantor lecture, by Alfred Maskell, F.S.A., published in the *Journal of the Society of Arts*.

such as these statues reached the joints would not be perceptible. It is interesting to recall, in connection with the raw material, the machine invented by M. Alessandri, shown at the Paris exhibition of 1855, by means of which veneers of ivory in sheets as large as 30 by 150 inches were produced.

In these days of collecting works of art, when the prices of first-rate specimens of the various branches has of late years become so high as to be prohibitory to all except the American millionaire, it is important that amateurs especially should be on their guard against the clever forgeries which abound. Ivories have not escaped. Some thirty years ago the authorities of the Museum at Brussels paid 800*l.* for a forged consular diptych—it would have been cheap to-day at ten times that sum, if genuine. The Louvre has suffered, and with the museums of Rouen and Lyons (some thirty years ago) bought three specimens of the very rare images of the Virgin, known as "*Vierges ouvrantes*." Quite recently the first-named has been withdrawn as a forgery. A genuine example—the "*Vierge de Bourbon*"—brought at Christie's, three years ago, the large sum of 3,800*l.*

In the spring of 1904 Mr. Craig-Brown, a well-known Scotch gentleman and collector of objects of art, being in Italy and passing through Bellagio, was much struck by what appeared to him to be a very fine ivory shield of large dimensions in the establishment of some dealers in the town. The shield, as you see it here, measured something over 3 feet in height with a corresponding breadth. The story told to Mr. Brown was that it was the property of the reigning Duke of Parma, presented to one of his ancestors by the royal family of England. You will observe the Tudor royal arms at the top. The price asked and given by Mr. Craig-Brown was 400*l.* Well, to make a long story short, the thing is a fraud, a quite modern forgery, and the Duke of Parma knew nothing at all about it. Mr. Craig-Brown brought an action in the Italian courts and eventually recovered his money. Meanwhile, at his request, I paid him a visit in London and saw the shield. In my judgment, as I told him, I believed the centre to be a modern copy with additions of a seventeenth-century Germany ivory plaque by Antonio Leoni in the museum at Munich, the border adapted from a well-known Renaissance steel shield in the Louvre. You will note here some differences which have been made. But mind you, at the same time, I think it is every bit as good as—whatever may have been his value as a sculptor—it would have been if a genuine work by Antonio Leoni. Passing through Brussels some months ago Mr. Craig-Brown was not a little startled to find an identical copy for which the same price 400*l.* was asked in the establishment of M. Nossent in the Rue de la Madeleine—he may as well have the benefit of the advertisement—and I heard only yesterday that you can get another one, same price, in Venice. Now all this is, I think, very instructive, and there is a further moral. Why do we not buy for the actual beauty of things, the beauty we ourselves may see in them? As I said just now, the seventeenth-century sculptor could not have turned out better work. And again, sometimes it is the biter who is bit, I think. You buy at a cottage in Clovelly, for instance, what you think a find, a genuine piece of Della Robbia ware, let us say, for a pound or two. It turns out to be a clever imitation. Are you justified in reproaching the wily cottager or his employer, or on the other hand, if really genuine, how much of the 1,000*l.* or so which you might realise would you think you were called upon to present to the ignorant original possessor?

In all works of art, so clever is the modern forger that the greatest experts are constantly deceived. If you are not an expert, and indeed if you are, always verify what may be called the *état civil*—the life history of the object offered to you.

Few people, so far as my experience goes, even amongst those who are generally interested in works of art, seem to be aware of the extent to which ivory sculpture is practised at the present day by distinguished artists. We know that it is used for such prosaic things as billiard balls, paper knives, cutlery handles and toilet objects, and other objects of utility which we are accustomed to see in shop windows. Visitors to Dieppe also know that it is still famous as a centre of ivory carving, that crucifixes and figures, fansticks and knick-knacks of all kinds which may be qualified as art of a certain kind abound there; that Chinese and Indian productions of a similar kind answer to the demand that is made for them, and that in recent years Japanese figures of a better type command compara-

tively high prices. But I am often asked whether any of our best modern sculptors work in ivory, and when we consider the beauty of the material, the esteem in which it is held by artists and their willingness to use it, the surprise to me is very great that so little is generally known concerning the practice of ivory sculpture, and the beautiful work which has been executed by our most distinguished artists. Now and again a figure or two may be observed at our Royal Academy, or perhaps a modest attempt at decorative work manages to insinuate itself at an exhibition of arts and crafts. But they are not the fashion; they attract some desultory attention, are acquired by a discerning collector, disappear and are forgotten by the public at large. We have no museum for the encouragement of modern art like the Luxembourg at Paris, there is no fashionable lead and the encouragement of ivory sculpture would appear not to be within the terms of the Chantrey bequest.

Then again, ignorance concerning art in ivory still requires to be dispelled amongst the authorities who rule and manage our international exhibitions. Otherwise, would it be possible to believe that at these—certainly up to that at Paris in 1900—ivory carving has been classed with leatherwork, brush-ware, basketwork and a number of other industries? The same juryman would be called upon to adjudicate on the decorative sewing of a boot, or the art value of a carved meerschaum pipe and the merit of a *chef d'œuvre* of ivory sculpture by a Frampton or a Damp. It is little wonder, then, that artists of distinction declined to exhibit under such conditions, and that the public should remain in ignorance. Yet after all nothing is more certain than that the most distinguished amongst our sculptors have been accustomed to work in ivory. And it is pleasant to see that in recent times attempts have been made to place the art of ivory sculpture in the position which it once held and which it is entitled to hold; that is to say, on an equal footing and in an equal place of honour with sculpture in marble or bronze or in any other material. A first exhibition was held in Brussels some twenty years ago, at which all the most distinguished amongst the Belgian sculptors and some fifty others exhibited, and the year before last a most successful exhibition was held in Paris. It is true that in order to justify the expectation of a revival of ivory sculptures more than this is required. But everything must have a beginning. A great deal depends on the trend of fashion, that is to say of patronage. It is useless to ignore this fact. Huge sums are given by the wealthy patrons of art for specimens of the antique, more or less genuine, the bulk of which goes into the pockets of the dealer. What is necessary is that their tastes or inclination should turn in the direction of the modern, of the living artist.

The profession of sculpture demands in many ways expense. From the point of view of the quality of the material, it costs as much to execute a bust or a statuette in ivory, a foot or so in height, as to produce a life-size statue in marble. The sculptor is only too willing to use ivory as a medium, but he cannot be expected to sacrifice his material interests and educate the public at his own expense. Those whose work in ivory I shall presently briefly bring under your notice are in the first place great sculptors in marble. They naturally in another direction have regard to public requirements. Ivory is a delightful material to work, delicate and graceful in results, grateful in every way to the artist. It is to monumental sculpture what the miniature is to painting—or rather it takes its place with bronzes and goldsmith's work. Any sculptor can work it. It requires no special knowledge or training. But from about the time of the Italian Renaissance it got into bad hands and became the product of the workshop rather than of the studio of the artist—there being all the time, however, in every age, sculptors of the highest distinction who kept alive its traditional position and redeemed its character. Still, generally speaking, as an art it fell, and suffered from its mechanical abasement. To the public nowadays carving in ivory suggests China or India or Dieppe, nothing more. People may pay for such things what they may be worth, but it is not at such a price that a sculptor of reputation can work. Then, again, the Church. When one thinks of the examples of ivory sculpture destined for the service of religion—the diptychs and triptychs, pastoral staves, statuettes and crucifixes of the thirteenth and fourteenth centuries—one marvels at the horrors which have taken their place since the patronage and influence of the Church on art no longer are of value. And again, if one remembers the large sums obtained for a Byzantine or Mediæval ivory casket, one cannot help thinking what a great artist could produce if he were offered

adequate inducement. What could be more appropriate for presentation caskets than a simple one in ivory deriving the principal value from the work of a great sculptor? What more worthless than the hideous productions of the silversmith's shop which our corporations present to foreign potentates and distinguished guests, or as prizes for distinction in the field or in sports?

Who, then, are the great sculptors to whom I have referred as being so little generally known? I wish, indeed, that there remained more time at my disposal, enabling me to do more than briefly refer to their work. The revival of ivory carving in quite recent times is due to Belgian sculptors. This is as it should be, for throughout the golden age of ivory sculpture in the thirteenth and fourteenth centuries Flemish artists were particularly distinguished; and again in the days when the art of the rococo ran riot, the Fiammingos, the Van Opstals and the Fay-d'Herbes were the masters when decadence reigned elsewhere. So it is at the present day; encouraged by the proprietor of the Congo to make fashionable a material which is one of the most valuable products of that possession, we have in ivory some *chefs d'œuvre* from the hands of such well-known sculptors as Julien Dillens, Meunier, Van der Stappen, Wolfers and Samuel, not to mention a considerable number of lesser lights. Here is the charming statuette "La Gloire" of the first-named and the "Fée au Paon" of Wolfers. Wolfers's work—he is also a goldsmith—is nearly always an admirable combination of ivory with gold, silver, enamels, precious stones and semi-precious marbles. In France I can only mention—for there is no time to do more—that such sculptors of the very first rank as Jean Damp and Theodore Rivière, amongst a host of others, give us yearly most charming work in ivory. This is his famous "Salammbô chez Mathô." The original is in the Luxembourg. Damp and others are famous also for busts and figures in ivory, or in ivory in combination with wood and other materials—portraits of celebrities and leaders of high life which ought to set a fashion and may become the rage. Then, again, ivory is largely used by such great artists as Lalique, and by Gardet and others for beautiful toilet articles, such as hair-pins and combs, mirrors, fans and the like. And so to come to England, and if it cannot be said that we can produce an extended list of workers, on the other hand it will be admitted that they number amongst them our greatest names. This is Frampton's beautiful "Lamia," exhibited at the Academy in 1900, and now in the collection of Mr. Willy Vivian. It is the "Lamia" of Keats—in ivory and bronze, at the moment of the transformation. The face, with its studied serenity—cryptic, snake-like—is carved in life-size from a very fine block of beautifully-grained ivory, which was supplied to the sculptor by the very long-established firm of ivory dealers, Messrs. Myers & Son, of Tower Hill. Mr. Frampton tells me that for some things he prefers the soft variety of ivory, for others the hard, and that he always uses live in preference to dead ivory. For large work a large grain is effective, for smaller, certainly less grain and closer texture. The block used for this bust weighed some 14 lbs. Whether ivory in sculpture should be polished or matted till it is almost like white marble, as some sculptors make it, and how far it should be used alone or in combination with other materials, are questions to which I can do no more than allude. Other admirable English sculpture in ivory in various private collections—our public ones possess not a single example—includes the work of such names as Alfred Gilbert, the late Harry Bates and Reynolds-Stephens, and at Lloyd's Registry you will see it beautifully used in the frieze by that clever young sculptor, Lynn Jenkins.

The subject of my lectures is so important and covers such a large extent of ground that, as you will have observed, I have on each evening been compelled to skip and abbreviate, and offer you scarcely more than indications for your consideration. As a matter of fact, it would not be difficult, I think, to make at least ten divisions, each one of which would afford more than sufficient material for an evening's lecture. But I shall be satisfied if the points I have indicated may have been sufficiently interesting to induce some of my audience to inquire further—there is ample and beautiful material in our great museums—and, at any rate, I am sure it will be admitted that ivory and its applications have played a more important part in the history of civilisation than at first sight might appear evident, that the material itself and its working is full of interest, that its usefulness enters largely into our daily life, and that in the history of art it has a place which is on

a level, at least, with any other of the sculptural arts, not excluding, indeed, even the graphic arts.

BEAUTIFYING LIVERPOOL.

A MEETING was held at Liverpool Law Society's Rooms, Cook Street, which had been convened by a sub-committee of the Liverpool Architectural Society with the object of forming a society having for its object the beautifying of the city. According to the *Liverpool Courier*, Mr. Henry Hartley presided and Mr. T. T. Rees acted as hon. secretary.

The Chairman said that the Society did not wish to tread on the rights of citizens, but already the Corporation had great powers under the Building Acts regulating the width of streets, air-space in backyards, &c. Why not extend those powers so as to deal with the artistic side of the question? A committee of taste should deal with the elevation of public and private buildings to see that they were not constructed on advertising lines, but in accordance with good taste and the character of the surroundings. Overcrowding in building districts should be stopped and buildings restricted to a certain number per acre.

Mr. Willink pointed out the difficulties supplied in existing legislation affecting public matters and the rights of private citizens. The Corporation could, however, purchase large estates on the outskirts and lay them out with a proper amount of space, and sell the plots of land, thus bringing back the purchase money and expenses.

Mr. Rensberg expressed his entire sympathy with the movement.

Professor Riley thought their chief object should be to educate public opinion. Models of buildings and proposed improvements should be constructed and exhibited.

The Chairman intimated that letters in support of the movement had been received from many societies, including the Liverpool Kyrle Society, the Liver Sketching Club, the Ruskin Society, the Historic Society of Lancashire and Cheshire, the Housing Association, and the Garden City Association.

The following were appointed as the executive committee:—Mr. F. J. Leslie, Dr. Caton, Mr. Hall Neale, Mr. Kirby (president of the Architectural Society), Professor Riley, Mr. J. G. Dawbarn, Mr. Willink, Mr. Wardle (president of the Ruskin Society), Mr. John Edwards (chairman of the Housing Association), Mr. George Rose, the Rev. T. W. M. Lund, Mr. J. Cameron (chairman of the Law Society). Power was given to add three to the number.

ROMAN REMAINS IN SCOTLAND.

THE autumn meeting of the Classical Association of Scotland was held in Edinburgh University buildings on Saturday.

Dr. George Macdonald, assistant secretary Scottish Education Department, gave a lecture on "Roman Remains in Scotland, with Special Reference to Some Recent Discoveries." His main object was, he said, to convey to his audience some general idea of the progress which had been made in the last twelve or fifteen years towards arriving at a more complete knowledge of the history of Scotland in Roman times. The sister Association in England had, through its Manchester branch, shown an active interest in the corresponding period of English history by conducting a series of explorations at Melandra Castle in Derbyshire, and had published a handsome volume embodying the results. Was it too much to hope that, if not the Classical Association of Scotland as a whole, at all events those members of it residing in districts where traces of the Roman occupation were to be found, would in similar fashion lend their aid in what they could hardly fail to find a fruitful line of research? The older writers upon the subject had been guided towards their conclusions by a comparison between the scattered notices left by historians of Rome and such isolated traces of fortifications and the like as survived above the surface. Twelve or fifteen years ago, however, the Glasgow Archæological Society called in the help of the spade in an examination of the structure of the Antonine vallum. A year or two later the Society of Antiquaries in Scotland explored in scientific fashion the Roman fort at Birrens. Since then the latter body had continued their investigations on various sites, and were at the present moment actually engaged on what promised to be the most important of their whole series of operations—the excavations at Newstead, near Melrose. The lecturer pointed out that it was from Germany and France

that we had learned the methods of proper excavation, and also that the problems of research were to some extent simplified by the acquaintance which, thanks above all to the genius of Mommsen, we now had with the organisation and arrangement of the Roman provinces and of the Roman army. Scotland was included within the system of organised frontier defence. It was traversed by military roads and dotted over with small forts, the most notable line of which was that which lay along the wall of turf that stretched from Forth to Clyde. By means of a series of limelight views explanations were given regarding the aspect and plan of these forts, the nature of the objects usually associated with them and the general character of the life that they reflected. Particular interest attached to the plan of the fort built by Agricola on the Barr Hill, Dumbartonshire, to the astonishing varieties of miscellaneous articles recovered from the Antonine Fort on the same site by Mr. Whitelaw, of Gartshore, and to the remarkable examples of Roman helmets secured in the spring of the present year at Newstead, in the course of excavations now being conducted there under the charge of Mr. James Curle, of Priorwood.

At the close the usual votes of thanks were awarded.

THE BLACK ROOD OF SCOTLAND.

A MEETING of the Scottish Ecclesiological Society was held in the Architectural Association's rooms, Edinburgh, on Saturday. Mr. George Watson, Jedburgh, read a paper on "The Black Rood of Scotland," in which he stated that from the earlier accounts of it they learned that it was a piece of the true Cross, nearly 3 feet in length, upon which was fixed a figure of Our Saviour. It was brought here by Queen Margaret about 1067, and when she was dying in Edinburgh Castle in 1093 she requested it to be given her, and when presented she kissed it. Before he died at Carlisle in 1153 David I. made a similar request. Mr. Watson argued that there was no connection whatever between the Black Rood of Scotland and the origin of Holyrood, Edinburgh. The first writer who mentioned that was Hector Boece, but the charter of Holyrood expressly stated that the abbey was founded in honour of Holy Rood. The Black Rood was afterwards found by the officials of Edward I. in Edinburgh Castle in 1292, and it was probably sent to Berwick in that year, when it was taken possession of by him. Five years later he caused many Scottish magnates, both territorial and ecclesiastic, to swear fealty to him on the Black Rood. By the treaty of Northampton in 1328, the Rood was returned to the Scottish nation, along with the Ragman's Roll, which was burned by the Scots when it came into their possession. David II. took the Rood in his ill-fated expedition which ended in the battle of Durham in 1346, and the English, finding it among the spoils, made an offering of it to St. Cuthbert in Durham Cathedral. Bellenden, writing in 1533, said it was there at that time and was held in great veneration, but it was never afterwards heard of, and the probability was that it was taken possession of by the emissaries of Henry VIII. when the Durham monastery was dissolved in 1539.

TESSERÆ.

Giotto's Country.

IT is at least undoubted truth that Giotto was born and passed the years of childhood at Vespignano, about fourteen miles north of Florence, on the road to Bologna. Few travellers can forget the peculiar landscape of that district of the Apennine. As they ascend the hill which rises from Florence to the lowest break in the ridge of Fiesole, they pass continually beneath the walls of villas bright in perfect luxury and beside cypress hedges, enclosing fair terraced gardens, where the masses of oleander and magnolia, motionless as leaves in a picture, inlay alternately upon the blue sky their branching lightness of pale rose-colour and deep green breadth of shade, studded with balls of budding silver and showing at intervals through their framework of rich leaf and rubied flower the far-away bends of the Arno beneath its slopes of olive, and the purple peaks of the Carrara mountains tossing themselves against the western distance, where the streaks of motionless clouds burn above the Pisan sea. The traveller passes the Fiesolan ridge and all is changed. The country is on a sudden lonely. Here and there, indeed, are seen

the scattered houses of a farm grouped gracefully upon the hillsides, here and there a fragment of tower upon a distant rock; but neither gardens, nor flowers, nor glittering palace walls, only a grey expanse of mountain ground tufted irregularly with ilex and olive—a scene not sublime, for its forms are subdued and low—not desolate, for its valleys are full of sown fields and tended pastures—not rich nor lovely, but sunburnt and sorrowful, becoming wilder every instant as the road winds into its recesses, ascending still until the higher woods, now partly oak and partly pine, drooping back from the central crest of the Apennine, leave a pastoral wilderness of scathed rock and arid grass withered away here by frost and there by strange lambent tongues of earth-fed fire. Giotto passed the first ten years of his life, a shepherd-boy, among these hills; was found by Cimabue near his native village drawing one of his sheep upon a smooth stone; was yielded up by his father, "a simple person, a labourer of the earth," to the guardianship of the painter, who, by his own work, had already made the streets of Florence ring with joy; attended him to Florence and became his disciple. We may fancy the glance of the boy when he and Cimabue stood side by side on the ridge of Fiesole and for the first time he saw the flowering thickets of the Val d'Arno, and deep beneath the innumerable towers of the City of the Lily, the depths of his own heart yet hiding the fairest of them all. Another ten years passed over him and he was chosen from among the painters of Italy to decorate the Vatican.

The Walls at Richborough, Kent.

At Richborough the foundations were thus arranged:—First two rows of boulder stones lie on the natural soil, which is a solid pitted sand, then a thin stratum of chalk nodules, next a single row of boulders, and over them another thin layer of small chalk, all these being without cement; then boulders again, mixed with mortar. And so the masonry proceeds internally, with a confused mixture of large boulders, ochre stones, sandstone and blocks of chalk, the whole cemented with a mortar formed of lime, grit, large and small pebbles, sea shells and fragments of baked bricks. The outside of the great north-east wall is very beautiful to the eye, as well as magnificent. It is composed, as far as now remains, in general of seven great and fair distinct rows of stone, each of them very nearly 4 feet thick, and each of them consisting in general of seven courses of separate stones. The measure of the great combined courses sometimes varies a little, some being 4 feet 3 inches, whilst others are only 3 feet 3 inches in breadth, or rather in depth, which may therefore perhaps indicate an intention of forming them about 4 Roman feet in breadth or depth upon an average. These great courses of stone are separated from each other by six smaller courses of bricks, composed each merely of a double row of bricks that are about $1\frac{1}{2}$ inch or $1\frac{1}{4}$ inch in thickness, but are of very different breadths, from 8 inches to 1 foot; and of very different lengths, some being 14 inches, some 16 inches long and some $17\frac{1}{2}$ inches, a variation of dimensions to be met with in some other Roman structures. For in the old wall of Verulam was a brick, now worked up in the wall of the abbey at St. Albans, which is very nearly 2 feet in length, and there is one at Dover near 3 feet in length. The composition of these bricks is also as various as their dimensions. Some of them are entirely red throughout their whole substance (like our modern bricks), only of a deeper colour; some are red on the outsides, but of a deep blue within, the internal substance being formed of a different earth from the outside (perhaps for the sake of sparing the better and scarcer material). And here, again, we find a great similarity to other Roman works, for in the walls of Chesterford, Verulam and Silchester are exactly the same varied appearances. Some of the bricks also, here at Richborough, are of a yellow colour, having plainly been composed only of mud and clay taken from the neighbouring shore. And some of these latter might possibly have been merely dried by the sun, but how the red ones should become of that colour without the aid of fire, or how any (except the yellow ones) should have been dried in the sun, as has been hastily conjectured by some antiquaries, is incomprehensible. Let them have been formed how they will, the whole produces still a very beautiful effect to the eye. The structure is everywhere uniformly of this sort of style, except in some very few parts, where reparations have plainly been made in Saxon times, and with squared stones of a much smaller size and with herring-bone work.

Correspondence

Church of San Clemente, Rome.

SIR,—An influential committee of all denominations of clergymen and of archaeologists, under the presidency of the British Ambassador, has been formed in Rome to raise funds for the preservation of this ancient basilica, which dates from the first century of the Christian era. For more than thirty years the third or lowest church has been inaccessible owing to the collection of water, and an estimate has now been framed to drain it. The work is estimated to cost about 1,500*l.*, and over 100*l.* has already been raised locally. May I make an appeal through your influential columns to all lovers of ancient monuments, Christian and Pagan, without distinction of creed or nation, to help us to raise this sum? The Western Branch of the Bank of England at Burlington Gardens has kindly consented to receive subscriptions, which should be paid to the "San Clemente Preservation Fund." Subscriptions may also be sent to me direct, or to the British Consul at Rome.

—I am, &c.,

J. T. CROTTY, O.P.,

Rector of San Clemente.

GENERAL.

Her Majesty the Empress of Germany has graciously accorded her high protectorship to the work of the fourteenth International Congress for Hygiene and Demography, which will take place in Berlin from September 23 to 29 of next year.

The Roads and Bridges Committee of the Wilts County Council recommend the appointment of Mr. Alfred Dryland, county surveyor of Herefordshire, for the post of county surveyor of Wts, vacated by the death of Mr. C. S. Adye. There were 11 applications.

The Dunfermline Abbey Church, which was recently renovated and decorated at a large expenditure, has now had the electric light installed.

Dr. Arthur Schuster, professor of physics at Manchester University, has sent a letter to the Manchester education committee in which he says:—"I desire to offer, through you, to the Faculty of Technology one scholarship per year during the next three years, and shall be glad to place 50*l.* each year at the disposal of your committee for that purpose. I should like to say I am induced to make the above offer by the excellent performances of your students during the degree examinations last June. I should confine the scholarships to the subjects of chemistry, engineering and electrical engineering."

Flatford Bridge, on the Stour, which was introduced by John Constable into several of his pictures, and is now in danger of falling into the river, is to be restored on its original lines. A fund will be raised for the preservation of the wooden bridge.

Mr. Hugh Stannus will read a paper on "The Korinthic Capital" at the Royal Society of British Artists on December 4, before the Society of Designers.

Mr. James Dredge, of 103 Bedford Court Mansions, Bedford Avenue, London, W., for thirty-five years joint editor of *Engineering*, Commissioner-General for Great Britain at the Brussels Exhibition in 1879, and author of several engineering works, has left property to the value of 78,366*l.*

The Municipality of Barcelona propose to hold a fifth international art exhibition in that city from April 23 to July 15, 1907, which may again be opened in September and October. The exhibition will comprise the fine arts and art crafts generally. The time for receiving exhibits will extend from March 15 to 30.

The Worcester County Council have adopted a scheme for the decoration of the windows in the large hall of the Shirehall with heraldic designs and coats of arms of sheriffs of the county. The arms of chairmen of quarter sessions and also of the County Council will be inserted in separate windows. It was estimated that the cost to the county of the provision of the border, &c., will be 250*l.*

The University Court of St. Andrews have accepted an offer by Mr. John Ritchie, M.A., LL.B., Perth, to deliver short courses of lectures on the history of architecture in 1907-8 and 1908-9.

At the Last Meeting of the St. Asaph (Denbigh) District Council an application was received from Mr. Williams, highway surveyor for the Abergele district, for an increase of salary. The surveyor receives 72*l.* 10*s.* a year, out of which he has to provide a horse and trap. Estimating the cost of that at 30*l.* a year, it leaves a sum that worked out at 16*s.* 3*d.* a week. An increase of 12*l.* 10*s.* a year was agreed upon. The case was mentioned of another surveyor who received 22*l.* less than Mr. Williams, and he had to keep a horse and trap.

The Manchester City Art Gallery Committee will hold, in the Art Gallery in Mosley Street, during the months of December and January, an exhibition of Holman Hunt's collected works. The owners of most of Holman Hunt's works that were on view recently in the Leicester Galleries have promised them for this exhibition, and a few which were not exhibited in London have been secured for Manchester. It is proposed to open the exhibition about December 5.

The Committee of the Incorporated Church Building Society have passed a resolution expressing deep regret at the death of Mr. John Thomas Micklethwaite, F.S.A., for sixteen years a member of the committee of honorary consulting architects and latterly its President. They desire to record their sense of the great loss they and the Church at large have sustained by his death, and to bear testimony to the very careful and thorough way in which he rendered most valuable service to the Society.

The Trustees of the Macdonald Trust in connection with the Aberdeen Art Gallery have purchased the following pictures from the exhibition now on view in the gallery, to be added to the permanent collection:—"Volendam," a Dutch scene, by Mr. A. Gibson, Glasgow; "Poplars in the Thames Valley," by Mr. Alfred Parsons, A.R.A.; "Rain-storm on Dartmoor," by Mr. David Farquharson, A.R.S.A.; and "Aberlady," by Mr. J. Campbell Mitchell, A.R.S.A.

A Committee has been formed to erect a memorial to the late Rev. Sir Borradaile Savory, who for nineteen years worked for the restoration of the church of St. Bartholomew the Great and for its schools. The late rector was always averse to mural tablets being placed on the ancient walls of the building, considering that memorials should consist of something to beautify the church. In order to carry the idea into effect the committee have decided to protect the sanctuary of the church by a low screen, in part of which will be incorporated the personal memorial in bronze, and, if funds are sufficient, to substitute for the present temporary altar-rails two short rail-panels in bronze. Sir Aston Webb's plans have been adopted. In order to test the effect of the proposal, a model is to be constructed in one of the bays of the apse, and the committee will be invited to inspect the same.

The City Guardians have decided, with regard to the erection of a workhouse and infirmary at Homerton, "That, in view of the opinion expressed by the architect to the Local Government Board, they be empowered to negotiate with the architect, Mr. A. E. Pridmore, for his employment by them to prepare the final scheme and plans upon which tenders can be invited and the work carried out subject to the approval of the Guardians and the Local Government Board."

Mr. Banister Fletcher will deliver a lecture on Monday next at the University of London, South Kensington, in connection with the Extension Guild. The subject will be the Parthenon.

The Maidstone Urban District Council will consider shortly the following resolution:—"That the alteration to the Old Palace Gate House be postponed for the present, and that Sir Martin Conway, of Allington Castle, be asked if he will kindly view the building and give his opinion as to the best way to deal with it, and also to suggest an architect who has had considerable experience in restoring old buildings."

Stirling Castle has been transferred from the military authorities to His Majesty's Board of Works, and a local firm of contractors have been employed to repoint the whole of the old Parliament House.

The Commission appointed by the Turin municipality to study the construction of new railways likely to benefit the trade of Piedmont has proposed the adoption of a scheme put forward in 1882 for piercing Mont Blanc in order to allow the new line to be constructed from Aosta to Chamonix. If this project is realised, the latter town will be brought within 115 miles of Turin.

The Architect.

THE WEEK.

It is remarkable that a clause in a private Act of Parliament should override a public Act which was passed sixty years afterwards and is in operation every day. That anomaly was exhibited in a decision given in favour of the Millwall Dock Company for expenses in connection with a dangerous structure. In 1864 the Dock Company obtained an Act which enacted among other things that "the provisions of any Metropolitan Building Act from time to time in force do not extend or apply to any building of the company." There has been some contention whether the buildings belonging to a dock company which are exempted from the Building Act are other than those used for the purposes of the company. On October 24 last year a fire broke out in a building in Millwall Dock. Mr. CLARKSON, the district surveyor, directed that part of the building should be taken down, another part shored up. The Dock Company obeyed, but they declined to pay the fees, amounting to 1*l.* 2*s.* 6*d.* The magistrate, after consideration, held that the word "do" corresponded with "shall," and related not only to the Act existing in 1864, but to subsequent Building Acts. But Mr. DICKINSON thought the subject was important. He said he would be very pleased to state a case. The Legislature must be assumed to have a knowledge of the company's Act, and by avoiding all suggestion of amendment it was evidently their intention to allow the private Act of 1864 to retain its original authority.

A MODIFICATION has been introduced in one of the regulations respecting the new county hall. In July last it was decided that there was to be a preliminary stage open to architects of any nationality. From the designs sent in not less than ten nor more than fifteen were to be selected in private by assessors. The authors of the selected designs and eight selected architects were to take part in the second competition. It has been represented to the establishment committee that if the eight selected architects sent in their designs as the architects of any nationality it would be difficult for them to do justice to the designs unless they neglected the other calls upon their time. It has accordingly been arranged "that the outlines of the competition for designs for the new county hall do provide that the eight selected architects invited by the Council to send in designs in the final stage of the competition be not required to lodge their designs with the Council until the date fixed for the delivery of the designs in the final stage of the competition." Eight architects are therefore certain of taking part in the final competition, but, beyond this gain, it does not appear they will have more advantages than the ten or fifteen architects selected in the open competition.

In the article we published on the 26th ult. giving an account of the origin of the Collegiate Church at Manchester, which is now the cathedral, we said that THOMAS DE LA WARR in 1422 was able to obtain a license from the king to found a collegiate church. It was usual in such cases to have authority also from the Pope, and it had long been believed by investigators of the subject that there must have been some special reasons for the absence of the Papal document. The latest volume of Papal letters, published under the direction of the Master of the Rolls, contains a brief dated April 26, 1426, which supplies the void. Manchester then formed part of the diocese of Lichfield, and Pope MARTIN V. gives authority for the erection of the church into a collegiate church, the establishment of a college to consist of the master, eight chaplains and other ministers; then they shall have the power of framing ordinances and statutes and to pay certain con-

tributions to the diocese of Lichfield. All correspond with the rules accepted by THOMAS DE LA WARR, but the document fills a void which was the more remarkable on account of the importance of Manchester as well as of the founder of the church.

It was discovered some time ago that the fireproof ceilings at the Bexley asylum deflected so seriously as to become dangerous. Repairs have cost over 2,400*l.* The ceilings were carried out by sub-contractors, who declared as far back as 1902 that there was absolutely no reason to apprehend danger, and in 1905 it was stated there existed no warrantable cause for alarm. There can no longer be any question that the fireproof ceilings are failures. The asylums committee of the London County Council would, of course, wish that the whole expense in reparations should be refunded by the sub-contractors. By the contract deed they made themselves responsible for all defects within five years of the completion of the work. The deflections appeared subsequently to that period. The committee are therefore compelled to say:—"We have carefully considered the whole circumstances, with the view of seeing whether it would be possible to take any steps in the matter, and we have taken the opinion of eminent counsel as to whether responsibility for the faulty construction could be brought home to any person or persons. It appears, however, from his advice, that there are difficulties in the way of our doing this, and we have reluctantly come to the conclusion that we can take no further action in the matter."

SCOTSMEN are too prudent to allow the continuance of a dispute with a Government department concerning projects in which money is to be expended. We have referred recently to various plans for preserving the amenity of Stirling, which, with its castle, forms one of the most picturesque parts of Scotland, and is, moreover, a survival of Mediæval history of unusual interest. But the ground was valuable for building sites, and arrangements were entered into to dispose of part of it as sites for villas. The Stirling Town Council naturally looked forward to the introduction of additional ratepayers, and there was a possibility that amenity would be sacrificed to finance. A defence association was formed and they were able to count upon the support of Sir HENRY CAMPBELL-BANNERMAN, who is member for Stirling. It has been arranged that the Crown lands are not to be parted with, and the fine prospect which every visitor to Stirling can enjoy will not be impeded. The whole negotiations have been carried out in an amicable spirit, and should be imitated by other towns when they have dealings with official departments.

His countrymen believe in the architectural skill of ROBERT ADAM, and many grandiose country houses are the result. When the first Earl of FIFE resolved to erect an ambitious mansion which would be in keeping with his new dignity, ADAM obtained the commission. The work was commenced about 1740; yet, although the large sum of 70,000*l.* was expended, the building to this day is incomplete. His noble client had also the national failing for litigation. ADAM was successful in the law courts. However, it is not always advantageous to gain a victory over a client, and the earl revenged himself on the designer by an affected indifference to the great lonely mansion. Bishop Pocock described it as all of hewn freestone, brought by sea a great part in boxes. It consisted of four floors, with six rooms on a floor and towers at the angles. Although several alterations have taken place in the interior, Duff House still contains some imposing apartments. The people have acted very differently from those in Staffordshire when they were offered Trentham Hall by the Duke of SUTHERLAND. In the north, Duff House has been accepted with enthusiasm, and there is little doubt it will be used to the public advantage.

ST. PAUL'S CATHEDRAL.

THE name of the venerable Dean GREGORY has been so long connected with the cathedral of London, everyone must regret the charge he makes against the London County Council of seeking by subterfuges to precipitate the construction of the sewer by which the cathedral would be endangered. All the world knows the real and imaginary shortcomings of that body, but we doubt if its most bitter opponent among laymen would have made such a charge. People of all creeds unite in their admiration of St. Paul's as an example of architecture which upholds the national pride, for it will allow of a comparison with any other building in Europe. Unhappily clergymen who have attained high rank or influence, whatever may be the Church to which they belong, appear to think, as if by instinct, that they are possessed of infallibility—even in matters of business of which they can have merely theoretical knowledge. The cathedral architect believes, according to Dean GREGORY, that imminent danger would arise through the construction of the sewer, and the Dean endorses the views of his official. Now it should be remembered that last year Mr. SOMERS CLARKE, who then held the office of architect, informed the County Council that, relying on the advice of their engineers, Messrs. BARRY, LESLIE & Co., the Dean and Chapter did not regard with apprehension the proposed low-level sewer passing under the south side of St. Paul's Churchyard. During the last eighteen months there has been no change in the circumstances. No deviations have been put forth of a more dangerous kind than were originally contemplated. Not one yard of sewer has been laid. And indeed it is believed that the ground near the cathedral will not be affected for another year. Yet the venerable Dean, who is one of the Fathers of the English Church, does not hesitate to declare that precipitate action is being taken, in order, we suppose, to have the work completed before the public are aware of its commencement.

Everyone will admit that, with so great responsibility devolving on them, the officials cannot be too jealous about the safety of St. Paul's, for the conditions of the site, as well as the circumstances under which the building was erected, are of a kind which allow of the existence of doubt even after an endurance of over two centuries. The site was fixed from having been connected with a temple or church for centuries, and from being the highest part of the City. Clever as was WREN, he was not a geologist, and he did not realise what varieties of ground existed within the limited area on which he was to build. He thought he was laying great bases for eternity on material which it would have been wiser to have excavated and carted away. If the whole of the ground in the neighbourhood could be left untouched, then it is possible that the site might have remained as safe as it was originally. It was not the best of its kind, but with proper watchfulness the building might have continued as a stable compound of different materials.

London, from its character, cannot have unused subterranean places. Works which WREN could never have anticipated had to be carried out at all cost. Drain-pipes, water-pipes, gas-pipes, railways and much else were the inevitable consequences of a city which was modifying its conditions to suit modern life. But the authority to deal with the ground in the neighbourhood of St. Paul's was not conferred in secret. Each scheme had to obtain its own private Act, which was only granted after a very close examination, inspired by the opposition of rivals. The Dean and Chapter, we suppose, from the beginning made themselves heard before Parliamentary committees. But if they had neglected to do so, there is so strong a desire on the part of members to keep the humblest church uninjured that no measure would be allowed to pass in which there was the remotest danger to the cathedral. It may then be taken for granted that if something has

happened which was not foreseen, it would be very difficult to fix the responsibility for it.

If there was uneasiness about the future the Dean and Chapter have had ample time to take remedial measures by which the stability of the cathedral would be guaranteed. By means of steel and concrete, platforms can be created under the most difficult circumstances which can carry enormous weights. The operation would be expensive. But London is sufficiently wealthy to meet the outlay necessary for the preservation of its cathedral. People, however, imagine that when works of the kind have to be carried out the cost can be made by means of diplomacy to fall on various companies, and that those who receive the benefit will obtain it gratuitously. With such a history as St. Paul's it will be difficult to make out a claim which any Parliamentary committee or law court would ratify.

The important question at the present time is to decide what should be done. Under ordinary circumstances the theory that cathedrals belong to the deans and chapters is recognised and respected. But there are emergencies in which the country should assert itself and claim them as essentially national property. With one cathedral architect saying "There is no danger to be apprehended," and another announcing that "Danger is imminent," it would be ridiculous to wait until some catastrophe decides which view is correct. Nor is it a time when architects can go on claiming to be omniscient in all varieties of works, whether above or below the earth's surface. The question to be decided is whether there is likely to arise a sufficient shrinking of the material forming the ground as to cause a sensible settlement of a part of the building and what measures should be adopted to anticipate such an event. That is essentially a case for determination by engineers who have had experience with works more or less similar in character. What should be done therefore is to issue a Royal Commission to a certain number of members of the Institution of Civil Engineers, appointing them to investigate the subject and to report upon any remedial measures advisable. There would be no necessity for them to enter on an archaeological-historical investigation, or to point out what should have been done in preceding years. Taking things as they are, it would be quite enough for the Commission to discover whether there were impending risks, and how far all danger could be set aside. The Dean and Chapter might believe it was vandalism to attempt works except at a long distance outside the environment of the cathedral. That kind of privilege has, however, vanished with much else favourable to the existence of public buildings.

At first, as we have said, it is unnecessary to go beyond the simple question whether, if water has to be abstracted from the supporting material, and shrinking follows, what remedies can be recommended. The County Council engineers believe that the means proposed for the construction of the sewer will not result in the withdrawal of water, and that the material will remain in its present state. The engineers employed by the authorities agree in that opinion. But the Dean and Chapter seem to be rather apprehensive on the subject. It is essentially an engineering problem, respecting which information can only be obtained by those who have had to direct underground works on a large scale. We must own we are surprised that the clergy should allow their fears to be made known. It is never difficult to create a scare in the highly emotional minds of worshippers in a church, and the consequences in so large a building as St. Paul's could not be estimated. It is only a comparatively few experts who are capable of dealing with the subject, and until they have investigated it as a mere question of weight and supporting power it would be wiser to refrain from anything which will aid remotely in a panic. It may be supposed that the discussion over newspaper statements,

which represent nothing more than the speculations of amateurs, is a sign of the great interest taken in the security of St. Paul's. But it would not be difficult to find that with most people the subject is looked at merely as a somewhat piquant opportunity for chattering over matters which to the majority are mysteries.

AN ACADEMY RECORD.*

IN the interval between the publication of his sixth and seventh volumes Mr. ALGERNON GRAVES has had to meet with unmerited trouble. By an excess of generosity which was almost Quixotic he undertook responsibilities in connection with the historic house in Pall Mall which prudence would have avoided, and of which no court of equity would compel the enforcement. We hope the appreciation of his straightforwardness and self-sacrifice will be shown by encouragement to him as an author. It must be said that the new volume shows no sign of the anxiety amidst which it must have been completed.

For architects the contents of the seventh volume should have peculiar interest. Several of the great names associated with the art in England appear in the pages. The contributions of Sir JOHN SOANE fill ten columns. He was a man who believed that when any circumstance can be profitable, it should not be lightly abandoned. He recognised the use of the Academy. He began in 1772, when he was an assistant in HENRY HOLLAND's office, with "The front of a nobleman's town house." And there were few years in which he was not represented up to 1836, when he sent a design for the improvement of Westminster Hall, the Houses of Parliament and the Law Courts. He also contributed "A portfolio design for a British Senate House, from the original drawings made in Rome, 1779. This design was composed without regard to expense or limit as to space, in the gay morning of youthful fancy, amid all the wild imagination of an enthusiastic mind, animated by the contemplation of the majestic ruins of the sublime works of Imperial Rome." Few people would give credit to Sir JOHN for wildness of any kind, but, blind and solitary in his house in Lincoln's Inn Fields, his youthful effort must have seemed to be the creation of a different being. He won the silver medal of the Academy in 1772 and the gold medal in 1776, but neither design was exhibited. As travelling student he remained abroad until 1780. When he returned he exhibited the following in 1781:—"Design for a Dog House," "Elevation of a Mausoleum," "Design for a Mausoleum," "Plan of a Mausoleum," "Plan and Elevation of a Hunting Casine." For a time the drawings appear as if they were merely efforts to attract commissions, but in 1785-6-7 there was evidence of genuine work. SOANE was appointed architect and surveyor of the Bank of England in 1788, and in 1792 a view of the vestibule began the important series of drawings of that building which were exhibited from time to time until 1824. He was elected A.R.A. in 1795; he was also clerk of works to St. James's Palace, Chelsea Hospital, the Houses of Parliament, architect to the Woods and Forests, Dulwich College and much else. If multiplicity of offices could make a man happy, SOANE was to be envied. He not only prepared designs for triumphal bridges, but he was able to carry out several—such as one at Tynningham. For an ambitious man there could hardly be a more favourable time. The Houses of Parliament—and especially the House of Lords—could not be considered as adapted to the needs of a legislative palace, and as early as 1796 he prepared a design to render the House of Lords more commodious. Between 1800 and 1807 he made one or more drawings of a new House of Lords.

He possessed an order from the committee, and he took care to keep the subject before the public. The desire to have some part done prior to the fire was shown by C. H. TATHAM's proposal to convert INIGO JONES's Banqueting Hall into an Upper House. After the Continental war came to an end SOANE's ambition was excited by designing in 1817 "A national monument forming one side of a quadrangle, the other sides intended for sites of a Royal Palace, the two Houses of Parliament and Courts of Judicature." Parliament was not likely to approve of becoming a subsidiary element in any architectural design. SOANE was not, however, to be defeated, for after various designs for public memorials, in 1826 he contributed the following to the Academy, which is worth reprinting inasmuch as the same part of the Metropolis is now in course of alteration:—

Plans, elevations, &c., for completing the south side of Downing Place, and connecting the same with the new Council Office, the Board of Trade and the Treasury by a triumphal arch. This arch, decorated with statues of His Majesty, the Duke of York and the Duke of Wellington, the battle of Waterloo in basso-relievo, and other appropriate sculpture, is intended to perpetuate the military glory and invincible valour of Great Britain. The arch at the end of Downing Place, decorated with statues of his late Majesty, Lord Howard of Effingham and Lord Nelson, with the defeat of the Spanish Armada and the battle of Trafalgar represented in basso-relievo, is intended to record the glorious and ever memorable achievements of the British Navy. Downing Place—thus enlarged and enriched with national monuments commemorative of the splendid successes of the British arms by sea and land, and containing likewise some of the principal public offices and the official residences of several of the great officers of State—would form a suitable approach to the House of Lords from the new palace in St. James's Park whenever His Majesty should be graciously pleased to open the session of Parliament in his Royal person, and the procession would be no longer compelled, as at present, to pass under the low arches and gloomy vaultings of the Horse Guards. *Mihi turpe relinqui est.*

In the same year SOANE exhibited a national entrance into London which was intended to combine the classical simplicity of Grecian architecture, the magnificence of Roman and the fanciful intricacy and playful effects of Gothic. In 1828 he gave a view of a court in a proposed royal palace which was inspired by VIGNOLA's palace at Caprarola. It was to be erected in Hyde Park, with a series of magnificent hotels extending to Knightsbridge, Bayswater, &c. SOANE was disappointed when at last it was resolved to make alterations and additions at Buckingham Palace serve for the colossal scheme which had taken possession of him.

A great many people suppose that the SMIRKE family monopolised official architecture during centuries. The Academy catalogues show that although Sir ROBERT SMIRKE was treasurer for thirty years, during the whole of that period he did not once exhibit. That was setting a bad example to other architects, for if the Academy is to be recognised as a national institution certain duties are imposed on the members. He was sceptical about the benefit to be derived from having a drawing hung in an out of the way corner where few could see it, for architecture was worse treated than sculpture. Indeed the Academy record of Sir ROBERT is very curious. In 1801 he exhibited an *Infant Bacchus*; afterwards followed a scene from the "Merchant of Venice," a restoration of the temple on the Sunium Promontory, the Acropolis of Athens, and the Temple of Jupiter at Agrigentum. But of actual work, the theatres, clubhouses, colleges, public buildings, there was no sign. SYDNEY SMIRKE commenced exhibiting in 1820. He did not contribute afterwards for twenty years, and his last work was in 1869, viz. "The intended Design for the future adaptation of Burlington House to the purposes of the Royal Academy, as approved by Her Majesty."

SCOTT and MOFFATT had two drawings of the Orphan

* The Royal Academy of Arts: a Complete Dictionary of Contributors and their Work from its Foundation in 1769 to 1904. By Algernon Graves, F.S.A. Vol. VII.: Sacco to Tofano. (London: G. Bell & Sons.)

Asylum at Wanstead in 1842. However, GEORGE GILBERT SCOTT did not appear until 1847, when he entered in triumph with his "Church of St. Nicholas, Hamburg." He was then in his thirty-sixth year. In 1848 he had a view of the cathedral of St. John, Newfoundland; in 1850 the restoration of Chapter-house, Westminster, and in 1855 there was another victory with the Hôtel de Ville at Hamburg. In that year SCOTT was elected an Associate, and two years later an Academician. SCOTT was fortunate in being able to keep to secure ground, and not to tentative efforts. But the Hall of Science for Prince Consort's Memorial and the German Parliament House never became realities.

GEORGE EDMUND STREET began to exhibit in 1848 with a Cornish church. In 1857 he was able to show his design for a cathedral at Lille and a memorial church at Constantinople. He was so facile a draughtsman it might easily be supposed that he would take the fullest advantage of his position in the Academy to show examples of his drawings. But as a rule he rarely sent more than four, and in some years no work of his was to be seen on the walls.

The reputation of JAMES SAVAGE depends mainly on St. Luke's, Chelsea; yet he erected several other churches in London which were among the best types of Gothic as practised in the first half of the nineteenth century. The chapel at Burleigh Street, which was lately removed, was the last work he exhibited in the Academy in 1832. He designed two bridges over the Liffey in Dublin, and also contributed designs for a triumphal bridge and a Temple of Victory. SAVAGE was a type of the careful, hard-working architect, as skilled in construction as in design, and his Chelsea Church should establish his name.

It is not to be expected that we could do justice within our limits to 800 columns, and, indeed, we have been unable to say a word about the paintings and the statues. The book is a record of which the value is sure to increase as time goes on. The best of us cannot retain the names of all the paintings and drawings which we have seen in the Academy. But it is surprising with what power old scenes can be conjured up on going over the entries. This is one of the advantages of the book. The arrangement by which separate volumes can be purchased if desired enables a record to be obtained, which the members of a family must prize, at only an inconsiderable outlay.

ST. PAUL'S CATHEDRAL.

THE following statement respecting the possibilities of danger from sewer construction has been prepared by the engineer to the London County Council at the request of Mr. Evan Spicer:—

Northern Low Level Sewer, No. 2. St. Paul's Cathedral.
November 23, 1906.

In the year 1904, when investigating the question of the route of this sewer through the City, I found that almost the only possible course it could take would be past St. Paul's Cathedral on the south side. Having regard to the importance of the building, I considered it necessary to consult Mr. Somers Clarke, the architect to the Dean and Chapter, and after several verbal discussions on the subject, I arranged at his request to have three trial borings 8 inches in diameter made in the vicinity of the cathedral for the purpose of ascertaining the nature of the strata. The sites for the borings were fixed by Mr. Clarke himself, and on September 30, 1904, a letter was sent to him covering a tracing on which the results obtained from the borings were indicated, together with the position of the sewer in relation to the foundations of the cathedral. It was pointed out to him that the sewer would be about 16 feet 6 inches below the top of the clay in which it would be embedded. On October 1, 1904, Mr. Somers Clarke wrote asking a series of questions as to the nature of the works and the methods of construction, and particularly inquiring whether the Council would consent to submit the proposals

to an independent engineer acting for the cathedral authorities, and also if the works could be inspected during execution. On the same date Mr. Clarke acknowledged receipt of tracing before referred to showing the result of the borings, and promised to lay the same before the Chapter on October 6.

On October 3, 1904, I replied to the inquiries of Mr. Clarke, and stated very fully the nature of the works and the precautions to be taken to avoid any possible damage to the cathedral, and agreed on behalf of the Council to the suggested reference to an independent engineer, and to the inspection of the works during construction by any engineer appointed by the Dean and Chapter.

On November 17, 1904, I reported this matter to the main drainage committee, and they agreed to pay the expenses, not exceeding 50*l.*, incurred by the Dean and Chapter in consulting an independent engineer, and I so informed Mr. Somers Clarke.

On April 29, 1905, I wrote to Messrs. Lee, Bolton & Lee, Mr. Lee being the chapter clerk, and in their reply, dated May 2, 1905, they stated that Mr. Somers Clarke had full authority to settle this matter on behalf of the Dean and Chapter. I at once wrote Mr. Clarke, and on May 15, 1905, received a letter from him in which he said he was authorised to state that, "advised by their engineers, Messrs. Barry, Leslie & Co., the Chapter of St. Paul's does not regard with apprehension the proposed low-level sewer passing under the south side of St. Paul's Churchyard." He also went on to ask that the suggestions made by their engineers, Messrs. Barry, Leslie & Co., should be adopted, &c.

To all the proposals made by Mr. Clarke I assented, and on May 18, 1905, he wrote forwarding a copy of Messrs. Barry & Leslie's report, dated October 19, 1904.

The suggestions made by Messrs. Barry & Leslie, all of which are embodied in my specification, are chiefly as follows:—

No void to be left between the outer skin of the sewer and the London clay displaced to make room for it.

Between Creed Lane and Distaff Lane the highest part of the sewer to be not less than 16 feet below the top of the London clay, and cement grout to be injected round the outside of tube under pressure. The "shield" process to be adopted and the work carried out under air pressure if required; the excavation in front of the cast-iron rings not to exceed the minimum amount necessary to insert each cast-iron ring in place.

Messrs. Barry & Leslie further approved the proposal that the cast-iron rings should be 1½-inch thick, and they express the opinion that, with concrete and brickwork inside the tube and cement grouting outside, no corrosion need be anticipated.

I may state that the sewer is 7 feet 6 inches internal diameter and 9 feet 4 inches external diameter, and is 50 feet below the roadway.

So far as the facts are known from information derived from plans lent by Mr. Somers Clarke, it would appear that the foundations of the cathedral rest on a layer of loamy soil or potter's earth which, in its turn, rests on the gravel which overlies the London clay. This gravel contains (according to the borings made in 1904) only from 3 feet to 5 feet of water, which is upheld by the clay, but does not penetrate into it. The sewer being 16 feet below the clay, it will not drain the water out of the gravel, as it will be made entirely in tunnel, compressed air will be used during construction, and there will be no shaft or opening of any kind from the surface between Ludgate Circus and Queen Street at its junction with Cannon Street. The proposed sewer at its nearest point is from 35 feet to 40 feet in a horizontal line away from the cathedral. Between the underside of the foundations of the cathedral (according to the best available information) and the top of the sewer a distance of about 40 feet vertically will intervene.

There is not the slightest likelihood that any water will drain on to the back of the cast-iron tube forming the sewer.

There is already a 4-feet 6-inch by 2-feet 8-inch local sewer in St. Paul's Churchyard between the proposed sewer and the cathedral. This local sewer is in the gravel which overlies the clay, and is from 20 feet to 25 feet below the surface of the roadway, and is below the level of the foundations of the cathedral.

Since May 1905 I have had no communication, official or otherwise, with the cathedral authorities, either as regards the construction of the sewer or any subsidence of any part of the cathedral. I may also say that I saw Mr. Somers

Clarke several times during last September, and he made no mention to me of any settlement at the cathedral.

In conclusion, I have to state that the sewer has not yet been commenced at any point within two miles of the cathedral, and no shafts have been sunk.

I attach hereto copies of the principal letters which have passed between me and the cathedral authorities.

MAURICE FITZMAURICE.

THE LATE WILLIAM MACKISON.

INTIMATION of the death of Mr. William Mackison, C.E., F.R.I.B.A., until recently city engineer of Dundee, which was made on Saturday, came as a surprise and shock, says the *Dundee Advertiser*, to the community at large. Except among his more intimate friends it was not known that he was ill, and even by them a fatal termination was hardly expected. It appears that for a fortnight Mr. Mackison had suffered from a slight indisposition, and it was not until a few days ago that complications arose which, assuming a dangerous form, ended in death shortly after three o'clock on Saturday morning. Deceased had been residing at Kirkton House, his residence at Auchterhouse, and there he passed away in the presence of his family.

A native of Stirling, where he was born in 1833, Mr. Mackison first made the acquaintance of Dundee in 1844 by entering the high school of the city in order to complete his education. He was a diligent and clever pupil, and took a good position in all his classes. Six years afterwards, in 1850, having in view the law as a profession, he was given a situation in the office of Messrs. C. Kerr & Co., solicitors, but after a short time, on a favourable opening presenting itself, he transferred his services to his native town, and took employment with his uncle, the late Mr. Francis Mackison, C.E., architect and surveyor. He definitely decided to adopt the profession of architect. In Stirling his career was very successful. He was fortunate in obtaining a wide experience in all branches of architectural and surveying work, and many of the most handsome villas and buildings, not only in the town itself, but in the surrounding district, were erected to his designs. The important offices of master of works, burgh surveyor and town architect in Stirling were held by Mr. Mackison, and during his tenure of them he was also entrusted with the supervision of the excavations at Cambuskenneth Abbey and the restoration of the fine old tower of that historic pile. As a recognition of the excellent manner in which he carried out this commission he was elected a Fellow of the Scottish Society of Antiquaries, and the same year was chosen a Fellow of the Royal Institute of British Architects—he and the late well-known and celebrated architect, Mr. David Bryce, Edinburgh, being at that time the only men enjoying that distinction. In other walks of life Mr. Mackison was a prominent figure.

It was in May 1868 that Mr. Mackison came to Dundee as burgh surveyor, in succession to the late Mr. Fulke. These were the days of small things. The surveyor's office was in the Police Chambers. Then there were only one assistant, one apprentice draughtsman and one apprentice clerk on the office staff; one inspector of works and two outside foremen over the squad of workmen employed by the Corporation. Needless to say, both the work and the staff of the department have greatly increased since that remote period. And the changes that have come over the city have been still more marked. Extensive drainage, paving and flagging operations have been carried out, streets have been widened and otherwise improved, and many important building schemes have brightened and beautified the town. One of the first tasks set Mr. Mackison was the laying out of the grounds around the Albert Institute; then followed the formation of Balgay Hill and cemetery (in which he was assisted by Messrs. Scott and M'Kelvie, town architect and superintendent of parks respectively); and after that came the preparation of the plans and sections of the Police and Improvement Act of 1871. This 1871 Act involved a large amount of additional labour on Mr. Mackison and his assistants, not only immediate but prospective, he having under it to examine and report upon the plans for all new buildings within the city and superintend their execution. The public baths, public cattle market and abattoirs, the police stations and extensions thereof, the smallpox and epidemic hospitals and King's Cross hospital, the extension and reconstruction of the cleansing department buildings, the new skating-ponds and the fish market were designed and carried out under his directions.

He also prepared the Parliamentary plans for the street tramways and the Esplanade and river reclamation works; also the Parliamentary plans for the boundary extension, &c. The extension works by the unemployed were performed from time to time under his oversight.

For a time Mr. Mackison also acted as water manager. During the water famine he brought the water of the Fithie into the Crombie Reservoir, carried out considerable extension of town piping, and effected many improvements at Monikie. In due course the water department was considered of sufficient importance to warrant the appointment of an engineer specially to attend to its manifold responsibilities, and Mr. Mackison was thus freed to devote all his attention to the duties coming under the cognisance of the present-day works committee.

But apart from professional cares, and notwithstanding the call which these made upon his time, Mr. Mackison proved a helpful citizen in other spheres. All religious and philanthropic causes found in him a constant and earnest supporter. He was a member of the Sanitary Association of Scotland, holding for two years the position of President, and was one of the first to support the formation of the Dundee Institute of Architecture, Science and Art, of which he became first Vice-President and afterwards President.

Into the causes which led to his severance from the service of the municipality it is not necessary to enter. That is a matter of recent history well within the recollection of the community; and still less is it required to do more than mention the action for 15,000*l.* raised at his instance, and still pending in the Court of Session, against the Town Council as compensation for work performed by him and claimed to have been outwith the scope of his office. Deceased was a man of sterling probity and character, of gentle manner and genial disposition, generally esteemed, and much liked by his subordinates in the public service. Mr. Mackison, who was seventy-three years of age, is survived by a family of two sons and one daughter.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the annual social gathering of the Leeds and Yorkshire Architectural Society, held at the Queen's Hotel, Leeds, a musical entertainment followed the address of the president (Mr. H. S. Chorley, of Leeds). It also fell to Mr. Chorley's lot to distribute prizes awarded to students of the Society during the past twelve months. Mr. W. P. Rylatt won prizes (1) for a measured drawing of Methley Church, (2) for sketching and (3) for construction. To Mr. Carnelly were awarded a special prize for designs; while Mr. W. Whitehead won the second prize for designs, the essay prize and the Halden prize.

Mr. H. S. Chorley, in his presidential address, touched upon the Selby Abbey fire, expressing gratification at the prospect of the fine old building being restored to its original beauty. He hoped that Mr. Oldrid Scott, who had the work of restoration in hand, would be able not only to rebuild the burned-out portions, but also to carry out the other works contemplated in connection with the tower and south transept. The fire, proceeded the President, had demonstrated the danger of timber roofs, and raised the question whether it was possible to put fireproof vaulted roofs in Gothic churches. The stability of such places as the Pantheon and the Basilica of Constantine at Rome was due to the fact that their roofs were made of imperishable materials which could not be destroyed by fire or ruined by man's neglect.

Another question worthy of discussion was the proper preservation of our ancient monuments. Mr. Chorley mentioned in this connection that almost everywhere on the Continent the initiative had been taken by the State, while in this country the work had been carried out largely by private enterprise. Continental Governments had established State commissions to look after their national treasures. In England it must be said, of course, that so far as the work of actual restoration was concerned, the care of old buildings compared favourably with the work done elsewhere. In Europe many buildings had not been restored so much as rebuilt, and the State in its desire to preserve had ruined many fine monuments. The same complaint had been made occasionally in regard to this country, but generally speaking Mr. Chorley believed that restoration of buildings had been carried out with greater love and care than was shown on the Conti-

ment. But in other matters connected with the preservation of ancient monuments this country lagged behind. It was necessary, proceeded the speaker, that there should be a system of surveying and cataloguing to obtain a complete knowledge of all the architectural treasures the country possessed. Full insurance against fire should be insisted upon in every case, and an inspector of ancient monuments should be appointed. Mr. Chorley, with an eye to beauty, also added that advertisement hoardings in close proximity to these architectural gems should be prohibited. It was indeed evident, he concluded, that there was a real necessity for Government action in many directions.

The President also referred to the garden city movement, and urged architects to interest themselves in the housing question and take their proper place in any reforming movement, so as not to allow the matter to drift into the hands of the builder alone. Mr. Chorley said there was a growing necessity for the registration of architects, and in regard to the work of the Society he hoped next year to revive the sketching club, which had been a useful section of their organisation in the past.

Mr. Chorley was thanked for his address, on the motion of Mr. Sydney Kitson, seconded by Mr. Butler Wilson and supported by Mr. F. E. P. Edwards.

EDINBURGH MUNICIPAL COLLEGE OF ARTS.

THE sketch plan of the new art school has been approved by the Edinburgh Town Council. The block plan shows the central building with entrance hall, museum and cast gallery and buildings on the right and left, each with a hollow square in the centre. The frontage length over all of the building will, says the *Scotsman*, be about 420 feet and the average width about 140 feet. The entrance block has a frontage of about 60 feet and is situated to the west of the present entrance to the cattle market from Lauriston Place. Beyond it is a museum 55 feet by 40 feet, and behind that again on the north is a cast gallery for sculpture and architecture, which is 80 feet in length by 55 feet in width. The various sections of the arts have been allotted different parts of the buildings—painting on the north-east, architecture and the decorative arts on the south-east, sculpture on the north-west, and generally public offices and rooms for the administrative staff on the south-west quarter. On the museum corridor on the right is a students' room for ladies, and on the corridor on the left a corresponding room for gentlemen students. On the northern boundary to the east are rooms for drawing from the cast, painting from still life and flowers, marine paintings and landscape and etching studios. These are entered from the same corridor, which is about 120 feet in length. The eastmost room in the entrance floor is the lecture theatre, roughly speaking, 40 feet square, with cloak-room adjoining; while in the southern side of the east block are rooms for the preparation of colours, house painting, decoration, elementary drawing and design. The decoration apartment is nearly 50 feet in length by 40 feet in width, and has thrown out from it on its south side a conservatory for the rearing of plants and flowers. The building on the west of the main block has on the north side sculptors' classroom, life classroom, antique classroom and a room for decoration and ornament, the size of these rooms being about 40 feet by 30 feet. On the west end are workshops and an atelier devoted to casting, pointing and carving marble, stone and wood; and on the south front are rooms for elementary modelling, anatomy and a public office, the last mentioned entering directly off the main vestibule. In each of the central courts is a glass pavilion, 30 feet in length by 40 feet in breadth.

On the upper floor the library, 40 feet by 26 feet, is placed above the entrance hall. Behind it and above the museum is a hall, 54 feet by 40 feet, for the study of advanced architecture, while further on is a second cast gallery, 83 feet by 50 feet. The six classrooms on the north-east line of the building are devoted to painting from the nude and the draped model and to composition, while the upper rooms on the south side are set apart for architectural studies, the largest of these, for advanced decoration, being 50 feet in length by 35 feet in breadth. The upper rooms on the north-west side of that block have a range of seven studios, 20 feet by 19 feet, for advanced students of sculpture, the westmost corner room being for photography. On the south side of this block are rooms for the director, Council, secretary, a professors' common room and a large

room for students' proofs and school property. The caretaker's house is at the north-west corner of Lady Lawson's Wynd.

The scheme is that of Mr. Macgillivray, R.S.A., and the plans were prepared in the Public Office of Works.

NATIONAL MONUMENT, EDINBURGH.

A PAMPHLET, accompanied by a set of drawings by Mr. Henry F. Kerr, A.R.I.B.A., illustrative of the proposed completion of the National Monument for the Scottish National Gallery, has been issued.

Fortunately the questions, which involve the interests of science and art in Scotland and the credit of the country, are still open, and the Government may be relied on to deal with them according to the wishes of the Scottish people.

This would leave the venerable Royal Society of Edinburgh in the occupation of the Royal Institution, where, as Lord Kelvin said, the Society for the last sixty-two years of its life and work has enjoyed a lodging in the very best site in Edinburgh, thoroughly convenient in respect of all modern requirements.

It would leave the Royal Scottish Academy and other artistic societies both galleries at the south end of the Mound, affording ample space for all their requirements.

In connection with these buildings the Government would be put to no extra expense, and would be the better able to subsidise the institutions by which they will continue to be occupied.

The only questions remaining are those of the site and the funds for the National Gallery. Perhaps the finest site in the country was chosen by our ancestors last century for the National Monument. They selected as its model the Parthenon at Athens, which in its own class is undoubtedly the most beautiful building in the world. The building could be completed with an entrance hall and corridor, so as to afford more space for works of art and more room for expansion than the present National Gallery and the one adjoining it, while for those unable or unwilling to use the present access in carriage or on foot, a luxurious and easy elevator 300 yards from the Wellington Statue would set them down at its door.

The funds necessary, which to some timid Scottish people seem beyond reach, are equally accessible. Notice has been given by Mr. Norman Lamont, M.P., of an amendment on the National Galleries (Scotland) Bill, authorising the new Board to apply the accumulations held by the Board of Manufactures "towards the completion of the National Monument on the Calton Hill to serve as the National Gallery for Scotland." If carried, 28,000*l.* would become at once available for proceeding with the building and its access, and as the Royal Institution was built from purely Scottish money and is now valued at 200,000*l.*, it would not be too much to expect from the Exchequer a grant of that amount. Arrangements are being made for collecting whatever sum may be required to supplement the Government grant. Is it too much to expect contributions to that amount from all English-speaking people for completing what the venerable Dr. MacGregor truly writes "would be the finest thing in the British Empire"?

According to the town clerk, the completion of the National Monument on Calton Hill and the provision of a suitable building for the National Gallery of Scotland in Edinburgh, both of which are dealt with in the pamphlet, are of interest to the people of Scotland. The Corporation of Edinburgh, to whom the Calton Hill belongs, have expressed their readiness to give a site on the hill for the National Gallery if the Government resolve upon placing it there. Mr. Mitchell deals with the subject of the funds which would be required and the sources from which contributions might be expected. The Town Council, while not committing themselves to approval of Mr. Mitchell's views, invite attention to the questions discussed in the pamphlet.

In his pamphlet Mr. Mitchell submits the following suggestions:—

1. That the Bill be amended by reserving to the Board of Manufactures, established shortly after the Union, not only the "equivalent" annuity of 2,000*l.* thereby secured by the Scottish people, but the amount saved by the Board from that annuity. The present amount of the Board's capital is 36,481*l.*, invested in heritable bonds and Government securities, as stated in Paragraph 45 of the report by Mr. Akers-Douglas's committee. The Board should be

further authorised to apply these funds and any Government grants, donations and legacies which it may receive for the purpose in the completion of the National Monument on the model of the Parthenon, to serve as the Scottish National Gallery. By thus earmarking these funds, which belong to Scotland, an end will be put to the system under which Scotland has suffered so much in the past, and the institutions for the promotion of science and art in Scotland will fall to be duly supported by the British Exchequer in the same way as similar institutions in London and Dublin.

2. That the Bill be further amended by vesting the public buildings in question and collections of pictures, sculpture and antiquities contained in them in the Corporation of Edinburgh, the capital of Scotland, with power to manage the same by a committee of science and art, consisting of members of the Corporation and such representatives of science and art in Scotland as may be co-opted by the Corporation for the purpose.

At Mr. Mitchell's request, Mr. Henry F. Kerr, A.R.I.B.A., has prepared a set of drawings of the proposed reconstruction, which accompany the pamphlet. It is explained by Mr. Mitchell that—

(a) The interior is divided into a ground floor and a great hall above it. Setting apart the necessary space for the staircase at the east end and two lifts at the west end, there remains a rectangular area 120 by 64 feet, which is divided into six rooms communicating with each other and each measuring about 40 by 30 feet. The height of these rooms is 18 feet, and they are lit from the north and south sides, each room having three windows on one side. The sills of the windows being about 7 feet above floor level, the light will enter from above and the space below the windows may be available for statuary if not for pictures.

Including only the dividing walls, the lineal hanging space for pictures on the lower floor will be about	522
(b) The great hall, measuring 120 by 64 feet, will be lit from the roof by windows of thick glass occupying most of the spaces between the principals of the roof. The height of the hall is 27 feet at the sides and 35 feet in the middle. All the four walls will be available for pictures, and the lineal hanging space in the great hall will be about	341
(c) Additional space for the display of special pictures will be afforded by tripod stands, seven of which would afford further lineal hanging space to the extent of about	70
(d) The entrance hall and corridor to the south-east of the main building, lit from the roof, will afford further lineal hanging space of about	400
Total	1,333
The whole lineal hanging space within the galleries at the south end of the Mound is.	1,178

The proposed new National Gallery will thus have 155 feet more of lineal hanging space for pictures. The station of the electric railway beside the steps in Waterloo Place is only 300 yards from the Wellington Statue. Access to the National Gallery and the Hill will be obtained by a single line of railway worked by under-contact electric-power, which will terminate beside the entrance hall of the Gallery, passing through the trees and above the rock at a gradient of 1 in 8 for a distance of about 250 yards. In order not to interrupt the roadway below the Nelson Monument the line will be tunnelled to the south-east of that monument for about 56 yards. The present access to the Hill will not be interfered with in any way.

ANCIENT IRELAND.

A LECTURE was delivered at Manchester University on early Celtic Christianity by Professor Kuno Meyer. He traced the beginnings of Christianity in Ireland, and gave a glimpse into the Pagan civilisation which existed at the time of the first Christian missionaries. He deplored the reckless and wanton destruction of Irish antiquities and manuscripts which is still going on. Ancient oratories, churches and inscribed stones are being pulled down when the materials are needed to repair a neighbouring cabin, and the so-called restorations of the Irish Board of Works threaten these ancient monuments from another side.

Instead of excavations conducted on scientific lines, we were lately told of the proprietor of Tara Hill digging at random on that ancient site to try to discover traces of the lost tribes. The deplorable state of education in Ireland was responsible for such vandalism, and for the general apathy and ignorance of the Irish with regard to their own history and old literature. It was to be hoped that the Gaelic League, which was doing so much to revive interest in the language and literature of Ireland, would improve matters.

The whole of Ireland is covered with thousands of early Christian monuments, the earliest dating from the fourth, probably the third, century, and the shelves of libraries are full of thousands of unexplored Irish manuscripts—an almost neglected field of research. Ireland, in the golden age of its civilisation, was so strong and rich that it could afford to give of its wealth to other countries; the Continent was studded with Irish monasteries and schools, and Irishmen were the companions and advisers of kings. Going back to the first century of our era, Professor Kuno Meyer described the then ruling inhabitants, the Gaels, and said that they probably came to Ireland direct from the Continent, most probably from Gaul. The then trade routes went straight from the Continent to Ireland. Of the people who were living in Ireland before the arrival of the Gaels we knew nothing. He touched on some aspects of ancient Irish life and civilisation. Ireland in early times was split up into innumerable independent clans, and the idea of a central executive Government was unknown.

Much interesting evidence was drawn from the old epics, which were in prose with lyrical interludes, and which revealed a civilisation in which intellectual and artistic pursuits ranked high and where the ideas of chivalry were honoured, and from the lives of the early saints. The conscious falsifications which entered into these lives weakened their value as evidence, but they nevertheless threw valuable light on the times. The Pagan Irish worshipped idols and propitiated them by human sacrifices, particularly of children, and they worshipped the sun and trees and wells.

Professor Kuno Meyer thinks that there must in those old days have been considerable intercourse between Ireland and Britain. There were slave-hunting raids of the Picts or Irish on Britain, and a certain amount of commerce existed. From the second century there was constant intercourse between the two sister isles, and this was one of the channels through which Roman Christianity and civilisation reached Ireland. He combated the theory that Ireland was entirely Pagan before the arrival of St. Patrick in 432, and said that during the whole of the fourth century there was an organised Christian Church. Half a century after St. Patrick's death the Irish Church was at the height of its power and influence.

SOCIETY OF ARTS.

IN concluding his address at the opening of the session last week Sir Stewart Colvin Bayley, chairman of Council, said:—I have hinted in dealing with the future of the Indian section that we are somewhat cramped for space. For the past two years the Council were not without hopes that the Society might have received a great extension by becoming amalgamated with the London Institution, and that a new Society might have been established to carry on the work of these ancient institutions with renewed vigour. As you are aware, the efforts made in this direction have come to nothing. But the Council are now endeavouring to ascertain whether additional accommodation cannot be provided for the Society on the site it has so long occupied, by the acquisition of adjacent premises. Whether this can be successfully accomplished, and on terms which the Society can afford, is a question which is now engaging their very careful attention, and should their endeavours be successful, I have no doubt that the Indian section no less than the Society at large will be greatly benefited.

The Local Government Board recently rejected Acton's scheme for a new town hall and public offices at a total cost of 100,000*l.*, on the ground that it was unnecessarily elaborate and extravagant. An amended scheme was laid before the District Council last week to cost 36,000*l.*, this providing for municipal buildings only. Working drawings, prepared by Mr. W. G. Hunt, architect, were adopted, and specifications were ordered to be prepared.

NOTES AND COMMENTS.

AN experience on a comparatively small scale relating to reservoirs is now being afforded to the Metropolitan Water Board. A reservoir used to be a type of quietude; it is so well sheltered that scarcely a ripple agitates the surface of the water. And yet every official who has been connected with their construction or upkeep is aware that without any notice the mass of water can destroy both lives and property. Their history is marked both in England and other countries by terrible havoc and loss of human life. The case which the Metropolitan Water Board is now called on to deal with is the reservoir being constructed at Honor Oak. In the neighbourhood there is light yellow clay with some of those insets of sandy beds which it is difficult to explain, but which often are a source of danger. Great care is being taken in the preparation of the bed of the reservoir. But there are already indications that the clay and sand is liable to disturbance, and in such cases the work which is constructed above the beds is likely to follow suit. It is proposed to expend about 5,500*l.* to put an obstacle to the shifting and to strengthen the wall with counterforts. But the Board will be fortunate if they secure safety at so moderate an outlay. The difficulty in all such cases is that there are no counteracting pressures such as would arise from a second reservoir outside the first. The work will involve great anxiety. Messrs. MOWLEM & SONS, who have been entrusted with the operations, are also to construct another reservoir at a cost of about 140,000*l.*

IT was never anticipated when the world's great buildings were erected that they might have to encounter a fearful enemy in the form of an explosive. Another peculiarity of the danger is that, being unrestrained, buildings which would be spared in the ordinary course of war would not be exempted. The resources of civilisation, which is the phrase applied to explosives by advocates of the war against public buildings, are enemies with which it is difficult to contend. At St. Peter's, Rome, on the 18th inst. at midday, a tin can, like those containing conserves, was discovered between the altar known as Della Navicella and CANOVA's tomb of CLEMENT XIII., beneath a marble scaffolding which had been employed for repairs to the roof. The great basilica is guarded by a band of workmen known as the San Pietrini. They reside in quarters on the platform near the cupolas. Some of them are always on the watch during the night as well as day, and they declare they did not see anyone placing the destructive. It is remarkable that the large nails found in the case correspond with those used in the scaffolding. Evidently the contents were recently packed, for among the debris were fragments of journals two days old. The attempt was made by some unskilful hand, for otherwise it could not have been expected that under the favourable conditions so little damage would have occurred. What advantage would arise to the proletariat by the destruction of such a building is not to be understood. If it were proposed to convert the basilica to secular use the scheme might find supporters. But the destruction of a building like St. Peter's could not be remedied, for although another might be erected it would certainly be of a much cheaper class.

THE report on the work of the Department of Technology of the City and Guilds of London Institute contains about 250 pages of questions which were set in the latest examinations. They denote that there has been no playing with the seventy-four subjects. Special exercises were arranged for candidates proposing to become teachers of technological subjects. This year examinations were held at 444 centres, and out of the 20,610 papers, 11,665 passes were allowed. The examiners are not always flattering in their remarks on the results. For instance, it is unsatisfactory to read

"quite half the hand-sketches of the chisels were worthless" in the report on woodwork, and the illustrative sketches are also described as wretchedly drawn. One reason for the defects may be the kind of teaching adopted all over the country in the schools controlled by the County Councils. There are not a sufficient number of masters, and it is generally understood that the supervision is not exacting. The principal aim of all concerned is to have a large number of figures in their returns, and for statistical and fiscal purposes it does not matter whether the students profit by the instruction. The tests of the City and Guilds of London Institute should engage the attention both of the Government and the County Councils.

IN France the desire to praise men after their death is so general, it seems the more strange that *RAOUL ROCHELLE* should require no less than fifty-two years to elapse before he was eulogised at the Académie des Inscriptions et Belles-Lettres. He was the permanent secretary of the Académie des Beaux-Arts, and was also associated as member with many of the foreign academies. Although at the time of his death he was recognised as one of the foremost authorities in France on the paintings of antiquity, by some marvellous neglect he was deprived of the obituary notice which it was the duty of the member succeeding to his chair to deliver. He was, moreover, a type of the highest class of French professors. When twenty-three he taught history in the college of Louis le Grand in Paris. This was followed by his election to the chair of history at the Sorbonne. He published a history of the Greek colonies when he was twenty-five. Then from 1819 until the Revolution he held the appointment of superintendent of antiquities in the Bibliothèque Nationale in addition to a professorship of archæology. His works on the paintings of Pompeii and other memorials were in their time much admired. Nor has his reputation suffered by the investigations of the last fifty years. Yet if it were not for the thoughtfulness of *M. GEORGES PERROT*, it is possible that *RAOUL ROCHELLE* would have been unique in not being the subject of one of those memoirs which are the modern equivalent to the ancient funeral orations.

THE old-fashioned county histories always attract high prices. But for the information of ordinary readers the "Popular County Histories," published by Mr. *ELLIOT STOCK* at 3*s.* 6*d.* a county, are likely to serve as well as the more expensive volumes. Why they are not better known is one of the mysteries of publishing which only those connected with the business can explain. The latest addition is the "History of Oxfordshire," by Mr. *J. MEADE FALKNER*. That county has been connected in a marvellous way with the history of England and, we might add, of civilisation. The panorama which the author unfolds is remarkable, especially when we recollect the size of the county. Much of the effect is owing to the importance attached to the University, which from its foundation has been one of the motive forces of the kingdom. Architecture is also respected, for it must be remembered that *WILLIAM OF WYKEHAM* was a University don, and that *CHRISTOPHER WREN* was in the sixteenth century one of its miracles. Indeed, there is not a single page which is undeserving of study, and the short time spent in reading the book will be well rewarded.

HERALDRY IN RELATION TO THE APPLIED ARTS.*

THE imaginary animals that occur with such conspicuous effect in heraldic design would well repay the expenditure of more time than we can devote to them now. I must, however, be content to mention a few of their characteristics. The unicorn perhaps interests us most as an important part of the royal insignia. You may remember that two unicorns were the supporters of the royal Scottish arms, and when King James succeeded to the English Crown he used one of them as his heraldic supporter, with the lion of England on the other side, as they appear to this day. In so doing, the Tudor dragon, the dragon of Cadwallader, was displaced as a supporter though it still remains a royal badge. The unicorn is of composite character, having the head and body like those of a horse with the legs and cloven hoofs of a stag. A twisted horn issues from the midst of its forehead and its tail is usually that of a lion, in some cases is that of a horse, but it also has a tuft under the chin and others on the legs as a lion has. An instance of the latter form occurs in the supporters to the arms of the Goldsmiths' Company. Another form of unicorn, shaped like a goat, was also described in the "Bestiaries," those early and very meagre natural histories which supplied information (of a sort) to the Mediæval artist. This suggested the goat-like type of unicorn, with a short tufty tail, that occurs in foreign heraldry, the German and Swiss work for example, and no doubt it was from one of these sources that Pugin took the type when he introduced it into the royal armorials in the windows of the Houses of Parliament.

Next to the unicorn the griffin is most popular, as is shown by the application of its name to a creature which is not a griffin at all, viz. the dragon supporter of the arms of the City of London, at the place in the Strand where Temple Bar formerly marked the dividing line between London and Westminster. Griffins are half eagle and half lion, a lion's body with eagle's wings and head, and with eagle's legs for its forelegs. It must be particularly noticed that the head has large ears, and these form the distinction—a necessary one when a head only occurs—between that of a griffin and that of an eagle. Griffins in pairs form admirable decoration, as is seen in the front of a fifteenth-century coffer in modelled and painted gesso that is in the Victoria and Albert Museum.

Dragons are imaginary rather than composite creatures, and vary much in character, in many instances having a hard scalliness that is suggestive of the Chinese variety. In other examples a greater sinuosity and a more leathery texture is apparent, recalling the idea of "the loathly worm" of some ancient dragon legend. It was made part of the royal armorials by Henry VII., whose favourite badge it was, and became one of the supporters of his arms after flying, as a badge on a banner, over the fateful field of Bosworth.

The character of the dragon's head has also varied very much, from being comparatively short and spiky, resembling somewhat the demons' heads of the Assyrian sculptures, to having a much longer and more crocodile-like form, and to this there is now a tendency to revert. It is important to note that in English heraldry a dragon has four legs, and that a somewhat similar creature which has but two is called a wyvern, but that it is the latter form which is known to foreign heraldry as a dragon.

The crest is next in importance to the armorial shield and therefore demands a similar attention. Originally it was the badge displayed on the top of the helmet, in which conspicuous position it was even more distinguishable than the arms on the shield. It was at first a purely personal bearing that was confined to such as were actually knights. The knightly rank was very important, and we find Henry III. swearing to observe a covenant "As I am a man, as I am a Christian, as I am a knight," and this importance accounts for the special estimation in which the crest was held, apart from its prominence in the mimic battle and from its position as the apex of the heraldic group. This also accounts for its tardy acquisition of that hereditary quality which made the shield a family matter no less than a personal one.

The first kind of crest-like ornament to appear on the helms, which became so intimately associated with this kind of device, was an artificial derivation from what may be called a natural crest, a plume or panache of feathers. This

was probably made of leather or of thin metal in the fan shape that appears on some of the seals. Some interesting crests of shaped leather occur on the Celtic headpieces in some of the painted MSS. as early as the ninth century, but it would be too far-fetched, perhaps, to suggest any special connection between them and the fan crests of four centuries later, for helmets had rarely at any period been without some kind of crest decoration. The crested helm of Pallas Athenê comes to mind as a classic instance, with its triple crest ridges adorned with owls and winged horses.

The fan-shaped crests developed into a flat form with a cusped edge, and this was treated as a space on which to repeat the arms (or perhaps a single charge) rather than as a definite bearing in itself.

It has been mentioned that a crest is a badge or device placed on a helm, and it is worth noting that when it is removed from its helm it may be used as a badge again, an adaptation that may be very useful in allusive heraldry in cases where the whole arms may not be suitable to the general design.

Few examples of actual crests survive from those picturesque times, among the most notable being the lion crest that was carried in the funeral procession of Edward the Black Prince, and afterwards hung over his tomb in Canterbury Cathedral, where it still is. Another is that of the Spanish hero, James (the Conqueror), King of Aragon, in the Royal Armoury, Madrid; and a third is the dragon's head crest that was formerly in the celebrated Bardini collection, now dispersed. This dragon crest is a very bold and striking example of Florentine work of the late fifteenth century, and is probably the best specimen of a tournament crest that remains. High and sinuous crests seem to have found great favour with the Italian nobility, as is evident in the armorial tablets and panels of the architectural decoration. The Bardini example is about 17 inches high, modelled in leather and painted, and the torse is also represented modelled in the same material.

Prince Edward's crest, which accompanies the shield that we have already examined, must have been a very fine piece of work when its eyes and tongue were in their places, and the tail, perhaps, had a more spirited pose, but even in its present state it is a very interesting example. Shaped in plastic leather finished with gesso (in which suggestions of hair have been modelled), it was afterwards gilt and painted. The eyes were probably of glass, or may even have been jewels. Leather, softened by soaking in hot water, was the ordinary material for modelling crests, a core of wood being often employed to give stability to the whole. In other cases crests were modelled over a framework of wicker, and paper and canvas were used, as well as leather, with which to build up the figure, the final surface being nearly always of painted and gilt gesso.

The comparative lightness of the materials of which crests were composed enabled them to be made of imposing size, a fact to be taken full advantage of in representing them, and this has been the custom in all good heraldic work, their heraldic importance and their artistic value at the top of a composition alike tending to exaggerate what was already large, until, in much of the work of the fifteenth and sixteenth centuries, they became enormous.

In depicting crests the sense of stability should always be kept well in mind, for the suggestion of being, as it were, a part of its support, and not of being merely balanced on it, is essential to good heraldic design. Doubtless it was due to such practical necessities that so many of the early crests were demi-animals, animal's heads and other objects which could be secured in their places with least difficulty. At the same time, whatever meaning or symbolism was intended by the complete figure was equally conveyed by its more convenient representative.

Here again practical necessities, and the way in which they were met, resulted in decorative excellence, the lines of the crest being thus brought into pleasant relation with those of the helm and mantling in a very admirable manner. Heads are particularly effective in this way. They were often treated as a sort of cap to the helm, and merged, without a break, into the mantling. Whole animals were usually in the statant position of the crest of Edward the Black Prince and of the royal crest of the present day, the militant rage of the lion in the shield being somewhat curbed in the crest by the necessity for a firm fixture.

These were some of the considerations that influenced early heraldic design, and are points that may be usefully kept in mind in interpreting it.

It would seem superfluous to say that animals as crests should face in the same direction as the helm, that is,

* From the Cantor lecture, by George W. Eve, published with illustrations in the *Journal of the Society of Arts*.

in the direction of advance, if it were not for the fact that surprising instances exist of lions and other beasts placed across a helm, and even being made to face towards the back of it. The position of a knight's crest looking over his shoulder, or down his back, would have somewhat astonished the heralds at a tournament, and the spectators would have "made remarks," without doubt.

In the general decline of decorative art in the seventeenth century heraldry came off very badly, and the crest especially suffered ill-treatment. This was intensified by the impractical nature of many of the large number of new crests that were devised during the period that began soon after the cessation of the tournaments and continued until modern times; such as objects of all sorts between branches or between pairs of wings that are posed fore and aft on the helmet, one pointing over the wearer's nose and the other down his back; objects placed with much confusion in front of each other; rows of small objects in front of the principal one, and even birds flying and quite detached from support.

In one sense the evolution of a modern crest is exactly the reverse of the ancient method. Then the device was first produced in the round, as an actual crest, and consequently its transition thence, to any form of applied design, gave rise to no trouble of a structural nature. In more modern times crests appear to be devised solely with regard to heraldic difference, and as though they were to be viewed from but one aspect, any possible treatment in the round being generally left completely out of sight, as though newels and finials (carved in wood or stone, or cast in metal) or silverwork (such as the handle of a cup-cover) had never been heard of. One feels a sense of injury at the very existence of things that almost defy good treatment, and even though it is the duty of an artist to tackle difficulties and beat them, he cannot help resenting their unnecessary aggravation.

The principal difficulties in an ordinary way occur in regard to objects that are between branches or pairs of wings, especially when the last are charged with other objects.

As already said, figures of living things naturally face the front, while other objects are posed in the way in which they can best be seen. Flat objects, such as roundels, roses, portcullises and so forth may be placed across, or fore and aft, as seems best in each case, both sides of the object being assumed to be painted with such details as may be necessary. With regard to crests, it should be remembered that the essential point is always complete legibility, combined with a definite and reasonable relation to the helm and to the rest of the composition.

Fleur-de-lis crests were sometimes made in a very effective way by two of them being made to intersect each other at right angles like a vane, so that the complete form of the object was visible from every point of view.

As an effective support for the crest, the helm next demands attention. Following the same plan as before, we will first consider its actual structure, so that, knowing the principle on which it was formed, we may be able to design any number of helms and so be spared the necessity of repeating one form too often, or of finding a new model for every fresh need.

With regard to this and other parts of armour (and much of it occurs in heraldry, from the mailed hand as a crest to the complete suit of a figure supporter) you cannot do better than acquire a good working knowledge of the actual thing, the practical reasons for the form of its parts and the manner of their working. By so doing you will learn to handle the subject with confidence, so that light and shade and the harmonious co-relation of lines may be secured, while the structure appears convincingly right.

At first the helm was short and was worn on and supported by the head over the camail. It was provided with eye-slits or ocularia, which were reinforced with an additional plate that was usually in the form of a cross, a feature which may be varied and elaborated at the ends to a very decorative extent. You may be interested to know that the endeavour to lessen the weight without weakening the defensive power caused the back plates to be made thinner than the rest. This is one of the means of detecting forgeries, by the way. By the end of the fourteenth century the efforts to find a more perfect defence had resulted in the various forms of helmet, the small helm lighter and with movable parts that was less fatiguing to wear than the great helm, which from that time forward was reserved for the tournament. The tournament helm for this purpose was much strengthened, was made longer until it rested on the

shoulders, and so became a part of the body armour, to which it was firmly fixed back and front by straps and buckles. By this means the head was relieved of the weight, which was transferred to the body, and so the use of large crests as well as strong helms became possible.

Helms were of many shapes, which were, at the same time, but variations of the same general structure. The slope of the crown plate took different angles, the projections of the front plate increased, with consequent variation in the line of the middle ridge, and so forth. This bold strong line is of great importance in the composition of groups, in linking together the crest and the shield. Sometimes the lower edge of the helm spread out into a large gorget, and to it were rivetted the various attachments by which it was fastened to the body armour.

The central position of the helm in the heraldic group, a position in which it is, as I have said, of great value, both as a support for the crest and as a link with the shield, has, however, the disadvantage of tending to over-emphasise it, and this must always be taken into account. In painting there will be no difficulty in bringing it into proper keeping, especially when it is remembered that helms were sometimes themselves painted and their rivets gilt.

In certain forms of black and white, such as strong simple line, the perforations and structural lines will be found very useful in supplying decorative detail that will also tend to lower the general tone. The perpendicular join at the side may also be ornamented, of course, in a metal-like way, as by filing into cusps the spaces between the rivets, and the latter may become small bosses. The value of such detail is well shown in most of Dürer's heraldic engravings. He, of course, knew perfectly well what he was about with armour, as may be seen in the death's-head coat-of-arms and in the coat-of-arms with a cock. The helms in these compositions are almost identical with the actual tournament helms that Dürer designed to the order of the Emperor Maximilian. Another point which keeps the due relations of the helm is its forward tilt, which produces a strong tone on the part of the helm that is between the eyes-holes and the gorget. This tilt is due to the fact that the highest point of a helm is considerably behind its centre, and, therefore, when the helm is fixed on the top of a staff or stake it naturally tilts forward, while at the same time the crest is brought upright. In the tournament helm there are holes in the crown plate, some of which were for fixing the crest and mantling, others being to secure a lining in the helm.

The great helm was that which was usually represented in connection with crests down to the sixteenth century, and is by far the most satisfactory in every way. It was always represented in profile, or nearly so, down to the first half of that century, and it therefore displayed the crest in a very satisfactory manner. With the cessation of the tournaments real touch with early heraldry was soon lost, and the helmet, the lighter and more flexible head-piece, took the place of the helm in contemporary heraldic art. About the same time began the over-elaboration of heraldic rules, and it was arranged that the helmet should signify the rank of its bearer by its pose, and so we got to the present official rule—that an esquire's helmet is in profile with vizor closed and is of steel with gold ornaments; that of a knight is of similar form, but full faced, with vizor open; a peer's helmet is protected with gold bars and is profile; while that of the sovereign is all gold, is barred and full faced. It was also attempted to make the number of bars denote exact rank, but fortunately that effort failed. There is really no necessity for anything of the kind except in the case of a knight. A peer is perfectly distinguishable by his coronet, as the king by his crown. The reversion to the great helm in heraldic art began with Foster's Peerage, and is happily now well established.

Unlike the closed helmet the barred helm, as a crest support, has the sanction of actual use, being derived from the special headpiece which was used in the tourney, as distinct from the joust—the duel with lances, as already indicated.

In the usual group of shield, helm and crest the helm usually faces to the left—that is to say, to its own proper right, the dexter side, but this is not necessarily so if there is any reason for the contrary position, such as its occurrence in a book border, when it might help the general composition of the page to face the arms inwards.

In architectural decorations it may be advisable to face all the helmets of a series in one direction in relation to some central point, and they are often so treated in early works. Armorial in a chapel, for instance, often face

towards the altar, and in domestic decoration they turn towards the fireplace.

When two or more crests are ranged above a shield they are usually faced inwards, towards each other, with great advantage to the composer of the armorial group. If, however, it is desirable to face them all one way, in relation to the composition of a larger design of which they form a part, there is no heraldic objection to interfere with such a course. In other words, you may pose helmets in any way you think fit, except the full-faced position, which may be fairly reserved for those who are entitled to it under the ordinary rule. In German heraldry the charges of the shield are also made to turn the reverse way on occasion, and those on quartered arms are sometimes made to turn towards each other on the same shield. Both methods are, however, contrary to English practice, and should be avoided.

In addition to the tournament helms and their derivatives, many other headpieces were sometimes used to support crests, such as the salade on the medal of René d'Anjou in the fifteenth century; but this instance may be ascribed to the influence of the Classic style, towards which all were looking at the period, rather than to heraldic suitability. Salades came between the helms and the helmets, but are rarely used in heraldic design, most of the existing instances being found in German work.

From the helmet the mantling starts, covering its crown and hanging at its side, in some one of the immense variety of its ornamental forms. Heraldic rules have nothing to do with the form of the mantling, only with its colour, and the great freedom of treatment thus made possible is, of course, extremely valuable.

The treatment of mantling as ornamental form should be such as to support and supplement the shield and its bearings, and to assist in linking together the whole composition. Endless variety will be found possible in its design, and also in the way in which its lines may help each other in direction and force. The facility of twisting the main parts and of folding over the edges and ends is extremely useful in correcting balance and adding detail, as well of form as of colour; twisting and folding in this way being practically without limit. Such details must, of course, be designed to assist the swing and flow of the whole thing, or else be in obviously intentional opposition in crossing over; otherwise they will be confusing and worrying.

As to the colour of mantling, the only point on which heraldic rule has anything to say, the matter is very simple, so far as relates to modern memorials and to English use, viz. that the mantling follows the tinctures (the first colour and first metal) of the arms, whether of peer or commoner. Thus, if there are but two there can be no question, but if there are more, the first colour and the first metal that are mentioned in the blazon govern the mantling.

The mantlings of the king and of the princes of the blood are exceptions, those of the sovereign and of the Prince of Wales being of gold lined with ermine, and those of the other royal princes are also of gold, but their lining or doubling is white.

Formerly peers used mantling of their colour lined with ermine, and this is still the Scottish practice. Those who deal with colour, especially perhaps the glass painters, will no doubt resent this restriction, but I fear that it cannot be helped. The quality of the colour is, however, at their disposal, so that one may paint the mantling in lower tone than the shield in order to emphasise and make brilliant the central motive, or otherwise treat it as in one's discretion may be thought fit. The colour side of mantling may be decorated with lines and veinings of gold, as is done with charming effect in embroidery, and in addition powderings of badges may help to give a rich and decorative effect. There are many instances in early stall plates, and there is no heraldic reason against the modern use of this method of obtaining diversity of colour and interest.

The mantling being laced to the helm, and the crest fixed in position at the top, a torse of twisted silk was, as you know, placed round it. This is the wreath which has been so hardly treated in modern times, generally as though it were the edge of a shelf on which the crest rested, instead of being, perhaps, a lady's favour.

In present design the colours of the torse follow those of the shield, and consequently of the mantling.

CULROSS ABBEY.

THE abbey church of Culross was on the 22nd inst. re-dedicated for public worship. The abbey dates from the thirteenth century, but it is enough for our present purpose to note that in 1633 it was declared to be "the lawful parish kirk."

In the course of the centuries, says the *Glasgow Herald*, it has undergone many repairs, additions and makeshifts. Frequently it has needed the healing touch to preserve it from utter decay, and until the present restoration its ancient masonry bore traces that vandal hands had done the healing. One of the crudest attempts at restoration was made early in the last century, to be exact, in 1824, when the building was modernised. The healers on that occasion went about their work with unsentimental thoroughness. Carved arches were destroyed to make a flat surface for lath and plaster, and galleries which spoiled the symmetry and dignity of the interior were erected. In this "modernised" state it remained until recently, a sore spectacle to the pious archæologist. But time told on the lath-and-plaster workmanship of 1824; a sagging roof and crumbling walls demanded again the hand of the healer. Happily the latest restoration has been carried out to plans prepared by Sir Rowand Anderson, of Edinburgh, whose name is sufficient guarantee that reverent regard has been paid to the original design. The actual work of the restoration was entered upon eighteen months ago. It will involve a total outlay of 5,400*l*. Towards that sum the heritors are responsible for 2,300*l*. The congregation and influential committees in Glasgow and Edinburgh have undertaken to contribute the balance, and it is gratifying to learn that very soon the whole cost will be met. It is not a lavish expenditure for such an object, but within the limits set the work has been carried out with a taste and reserve worthy of all praise. The workmen have been worthy of the architect, and under the vigilant guidance of Mr. John Anderson, an archæologist as well as a mason, the mallets and chisels of the workmen have not been like those of the iconoclastic masons of 1824 vandal instruments which obliterated old carvings; they have been directed to restore the broken architecture to something of its ancient dignity.

The history of the original churches of Culross is rather vague. There are no authentic records. It is stated that on the site of the present building stood a temple founded by Bridei, the son of Derile, in 700 A.D. It was a thing of "wattles and mud." That and kindred theories may be left for learned archæologists to wrangle over. But there is more than traditional basis for the statement that the present church has undergone extension at four different periods. Originally it extended from the manse gable to near the centre of the site of the tower; it was next extended to the west side of the south transept, and then to the east side of the south transept. The choir and chancel are all that remain of the original edifice. The tower was of later date. It is a notable feature, and though its fantastic pinnacles are evidence of the genius of some doubtless earnest vandal, it preserves its ancient dignity. It is an impressive square structure, rising sheer from the ground. It is a rare specimen of the architecture of its period, though not unique. Inchcolm provides a similar example. The restoration has been thoroughly gone about. The entire church was gutted from ceiling to floor, the plaster was torn from the walls, and the wooden galleries, which were as useless as they were inartistic, were removed. The arches which were closed up by the early nineteenth-century workers have been reopened, and the aisles have been rebuilt on the old foundations. The windows which those same workmen had debased have been restored to their original design. The masonry of the old windows received scandalous treatment from the masons of 1824. Their fine tracery was broken up in order to make rubble.

The church in its former state had the pulpit situated under the arch on the north side, which acoustically was an impossible place. The pulpit has now been removed to the east end of the church and the pews face in the same direction. The flat roof of the old church has been replaced by a timber barrel roof, which adds to the dignity of the interior. In the course of the work of restoration excavations were made outside the south wall of the abbey. The spades of the workmen went deep enough to disclose the more magnificent foundations of the original building—no 1824 architecture about these. Many interesting finds were made, and these have already been noted in the *Herald*. Among these are several Celtic crosses, evidences that the site whereon the abbey stands had a place of worship long anterior to its foundation by Malcolm, Earl of

Greek Papers announce that the Corinthian Canal, which cost millions of dollars, would be sold at auction on November 14 on a foreclosure of a debt for 193,000 dollars.

Fife, in 1217. It is suggested that these interesting relics should be placed within the church. Some kistvaens were also unearthed, and one of these, the only one intact, contained a mummified figure. Fragments of carved stone effigies have also been discovered. To the archæologist (with imagination) these relics are pregnant with meaning; they may be regarded as broken links of an historical chain. Especially significant is the stone torso of a knight in full chain-plate armour. His coat-of-arms emblazoned on his tabard leads to the belief that he was a Stewart of Lorne. In pre-Reformation days the Argylls from their Castle of Gloom held sway over Culross and its abbey, and the remains of a tomb which has been discovered on the north side of the church is believed to have been the burial-place of that noble family in those days.

So far as the masonry is concerned, the work of restoration under the scheme has been finished, though a more lavish expenditure would be needed to satisfy fully archæological ideals. The fittings are in keeping with the taste displayed in the masonry. The floor is laid with pine and the pews are of the same wood, oak stained, fortunately not polished. The chancel is raised above the floor, and is bordered with stone flags, filled in with tiles, and on both sides are choir seats. It was suggested that the barrel-roof should be tinselled, but fortunately that suggestion, which smacks of artistic vandalism, was not entertained. There is also talk of an electric-light installation, but it is to be hoped that will never be. When daylight dies the only appropriate illuminant for the abbey of Culross is oil or candlelight. At present the interior though, as we have indicated, in admirable taste, may strike some observers as barren; it wants furnishings. Presently it will have a couple of finely stained-glass windows. One of these is to be known as the "Arnot window," and will be commemorative of the late Mr. James Arnot, a loyal son of Culross, who was clerk of the Edinburgh School Board, and who took a valuable part in connection with the restoration. The Arnot window, which is expected to be placed next month, will be situated in the east of the church, just over the chancel. The masonwork is an exact reproduction of the ancient window before the masons of 1824 had put in their fine work.

CARCASSONNE.

FEW towns of Southern France possess greater archæological interest than does the ancient city of Carcassonne. It consists of two entirely distinct towns up on the rock above "La Cité," the fortress at one time impregnable to the enemy, and the "Ville Basse," into which the inhabitants were driven by St. Louis when he demolished the suburbs of the "Cité." These two towns, half a mile apart from one another, lie on the opposite banks of the river Aude. The Cité was originally founded by the Volces, and was only a "castrum" when it fell into the hands of the Visigoths in the fifth century. They held it until 713, when the town was seized by the Saracens, who were driven out by Pepin the Short, the father of Charlemagne. In 1096 Bernard Atton, the successor of the early Conuto, founded the dynasty of the Vicomtes Trencavel. Later on, Raymond-Roger, the fourth Vicomte, embraced the doctrines of the Albigenses, and a holy war was declared against him. The crusading army sat down in front of the Cité, but failed to take it by force. They therefore got him to come out of his stronghold, and arrange the terms of an honourable capitulation. On his complying with their demand, he was treacherously seized by the crusaders, his knights were hanged, and the whole population, robbed of all but their shirts and breeches, driven into exile. Simon de Montfort was then proclaimed Vicomte of Beziers, Carcassonne and Rayés, and disposed of his prisoner Raymond-Roger by poison, but Simon's son was unable to maintain his authority and had to cede it to the king. Later on the Lower Town was burned by the Black Prince. During the religious wars of the sixteenth century Carcassonne was a Protestant stronghold, but modern warfare has diminished its importance and it has ceased to be impregnable. Its fortifications had, indeed, almost fallen into decay until they were restored some fifty years ago by Viollet-le-Duc, the great architect of the Second Empire. So much for history. The legends attaching to Carcassonne are innumerable. Thus, there is a large deep well close to the castle whose curb was restored with much taste towards the end of the fifteenth century. A story was long accepted that the Visigoths on one occasion were so terrified at the approach of the Huns that they con-

cealed all their treasure in some underground passages that could only be reached by means of this well, and that these treasures had since then been consigned to the custody of the fairies, who held sway in the caverns below. This story had secured so firm a hold on the imagination of the people that a company was formed early in the last century and enough money was collected to make the necessary excavations to rescue these valuables from the fairies. The scheme was a failure, for nothing was found but a few medals and some arrow-heads, which are now preserved in the local museum.

Though "Carcasso" was its name in the days of Roman Gaul, a more modern explanation, according to a correspondent of the *Irish Times*, has been given of its present denomination, and this tradition justifies the presence of Dame Carcas's bust over the Porte Narbonnaise. Charlemagne once spent five years in endeavouring to take this stronghold. So long did he remain outside its walls that at last only one defender was left, a Saracen lady called Dame Carcas, not because it was her name, but because she was Queen and Lady of Carcasso. She was endowed not only with considerable courage, but with great genius. She got up bundles of straw to look like men at arms, and provided each one of these lay figures with a crossbow. She also constantly changed her headgear, and was ever on the move from one part of the battlements to the other, firing with deadly effect upon the enemy. Eventually she resolved upon persuading them that not only were the garrison numerous, but food plentiful, so she stuffed two pigs with corn and drove them over the walls, where they burst in the ditch beneath. When the emperor saw this he thought it was really time to raise the siege. She was, however, resolved upon making a clean breast of it. The army was beginning to move when they saw her throw open the gates and ask for a parley. The soldiers sought out the emperor, and said to him, "Dame Carcas te sonne," from which words, it is alleged, came the modern name of the town. Charlemagne was so much struck by the account she gave of her powers that he confirmed her in her rule, and allowed her to hand down the government of the city to her descendants.

In our own time the French poet, Gustave Nadaud, has immortalised the city in one of his most touching poems, when he tells the story of the peasant, bent with age, who had but one ambition, which was to see Carcassonne. His wife and his son had been to Narbonne, his godson had seen Perpignan, but he had never had either time or money enough to go to Carcassonne, that was only six leagues from his home, near Limoux. He hoped God would forgive him his one ambition, though the curate had told him in his sermon that ambition had destroyed many men. If only he could find two days at the end of autumn, when the grapes had all been gathered in. At last the poet heard of his great desire and determined to drive him there, but, alas! such is the vanity of human wishes, he died half-way and never saw Carcassonne.

When we leave the railway station we first find to our right, in the "Low town," the church of St. Vincent, whose fine west portal is ornamented with four statues, one of which is said to be an exact reproduction of the features of St. Louis. The church dates from the fourteenth century and possesses an almost unique nave, whose Gothic vaulting of 66 feet is said to be one of the boldest in conception. The choir has some beautiful windows of the fifteenth and sixteenth centuries. A little further on is the church of St. Michel, which dates from the latter end of the thirteenth century, and has been used as the cathedral for the last hundred years. It consists of a single nave with three apses. On the west are a beautiful rose window and a massive tower, square below and octagonal above. The museum, which contains a fine stone cross of the fifteenth century and some good pictures, is on the way to the Cité, which is best reached by the old bridge, which was thrown across the Aude in 1184. It is from here we can secure one of the most striking views of this magnificent pile, begun by the Romans, rebuilt by the Visigoths, altered by the Saracens, again reconstructed by the Albigenses, and finally completed and modified during the eleventh, the twelfth and the thirteenth centuries, furnishing even at the present day a most comprehensive history of the art of fortification as it passed through its many stages from the fifth to the fourteenth century. It was this fact which induced the great Viollet-le-Duc to devote the best years of his life from 1850 to 1879 to the work of its restoration, and to make it the subject of one of his most interesting text-books.

The fortress consists of two enclosures, protected by

some fifty round towers. The inner enclosure, which is some 3,600 feet in length, is separated from the outer walls by some 20 feet, these outer walls being themselves 5,000 feet in circumference. The outer was the line of the Visigoth fortifications, whilst the inner was built by Philippe le Hardi about 1280. The great projecting round tower, the "Barbacane," which commanded the river and bridge, and thus enabled the garrison frequently to replenish their stores, was the work of Philippe's father, Saint Louis. Behind this stands the castle, formerly defended on the side towards the town by a moat and barbican, and flanked by round towers of the twelfth century. It could hold out for a long time, even when the town had fallen, for the garrison still commanded the Aude, whose bed was much nearer its walls than is now the case.

One of the great features of the Cité is the circuit of its ramparts and towers which join the battlements to each other. The Visigoth tower, with its Roman foundation, the tower of the Inquisition, where this dread tribunal held its sittings towards the latter part of the thirteenth century, and where a glimpse can now be obtained of those "oubliettes" in which so many of its victims were buried; the square Bishop's tower, dating from the thirteenth century, with its vaulted halls resting the one upon the other; the "Tour du Moulin du Midi," with its quaint bosses; the "Tour Saint Nazaire," supplied with a well and with a kitchen, which enabled it to resist a blockade when the town had been taken by the foe, and several others can be visited in their turn. The most wonderful piece of work is, however, the Porte Narbonnaise, on the east side of the fortress, a model of the ideal of what fortification should be at the end of the thirteenth century. No defensive weapon has been neglected; everything has been thoroughly considered by its architect. Though it has been described as a wall pierced with windows and loopholes, yet it is so admirably built and is so impressive that, in the words of Viollet-le-Duc, one asks oneself whether the rigid observance of architectural requirements is not one of the most powerful means of producing an effect. It is, indeed, a fortress in itself, defended by two immense towers and commands a view of the whole country round.

BYGONE PEVENSEY.

THERE are two Pevenses known to history—the village that is of the British Empire and the city that was of the Roman Empire. The former lives its life of rural contentment, yet breathes the musty breath of the past; the other, save its walls, is buried in Cimmerian darkness, only pierced by the researches of our archaeologists and antiquarians.

The enclosure within those grim, ivy-clad Roman walls first echoed with the spade of the excavator four-and-fifty years ago, when, fostered by the Sussex Archaeological Society, investigations were carried on by Messrs. M. A. Lower and C. Roach Smith, F.S.A., but no striking discoveries were made. Existing information with regard to the early history of the ancient city is very meagre, and, says the *Sussex Daily News*, a committee to carry out a scheme of excavations which would throw considerable light on it has been formed. Mr. L. F. Salzmann, who contributed to the Victorian History the introduction and translation of the Domesday text in regard to Sussex and the political history of Sussex, and who wrote the "History of Hailsham," is superintending the excavations, and Mr. J. E. Ray is assisting. Both are members of the Sussex Archaeological Society.

Seven trial shafts were sunk, in some cases to a depth of 9 feet, and the ancient pathway from the north postern gate was disclosed at a distance from the walls. From the result of these trials the committee laid their preliminary plans, and the intention is to follow the path, commencing at the postern, until it converges with the ancient path from the main gate on the west to the one on the Pevensey side. Here it is anticipated foundations of buildings will be unearthed. No general plan, of course, can be drawn up, as future discoveries may render it necessary to alter procedure. It is also intended to secure a foundation plan of the great entrance or Decuman gate on the west, and a ground plan of the Mediaeval castle in the south-east corner of the Roman area, and to explore the mound in the keep. Mr. Sands will have charge of the work dealing with the castle.

The fact that the 10 acres enclosed within the Roman walls at Pevensey is the site of the Romano-British city of Anderida is, after years of controversy, now generally

admitted. All the Roman stations on the Sussex littoral were identified by both modern and ancient names except one. There were at one time seven candidates for the honour of being the long-lost city of Anderida, but Pevensey presented the best credentials and secured her birthright. Possibly some discovery will be made in these excavations which will confirm it. It requires but a slight stretch of the imagination to conceive the waves of Pevensey Bay, then a deeper indent, lapping the foot of the eminence on which the Roman strategists built their 12 feet thick walls about A.D. 300, and that vast alluvial deposit, Pevensey Marsh, a swamp. The fact that the main defence, the great gate, is on the west side and the towers closer together there supports the contention that the peninsula was accessible from that land side only. The Romans neglected the usual rectangular camp and adapted the walls to the configuration of the ground, thereby enclosing a roughly oval space. Excavations at most other Roman stations, therefore, can serve as no criterion for a plan here. Trouble across the Channel called the Romans away, and they left the Britons, who had received their civilising influence, at Andredceaster. They were "citizens," we are told, so the place must have been of importance. Then the South Saxons came along about the year 490 and "besieged Andredceaster, a strongly-fortified city." When they left there were no Britons there, and "only the desolate site of a very noble city is pointed out to those who pass." Deathly silence, historically, reigns over the once "noble city" for over five hundred years, although there are traces of slight Saxon "herring-bone" repairs to the walls.

Then the great event occurred which made the name of Pevensey ring down through the pages of history, as it will as long as English history lasts—the landing there of William the Conqueror. There are evidences of the walls of the "desolate city" being very convenient for defence, as they exhibit now traces of Norman masonry, and of a fortress being erected within. This was destroyed and the Norman castle, the ruins of which stand to-day, was evidently erected on the site. Pevensey then entered on lively times and things looked up locally. The castle was besieged several times. Stephen "found it too strong to be taken by storm," King John ordered it to be demolished, which was probably not done; deserting earls from the battle of Lewes took shelter there, and at last it fell into the hands of the Crown, more or less ruined. As a prison it held James I. of Scotland, Edward Duke of York and Joan of Navarre, queen of Henry IV. In 1587 the threatened Spanish invasion caused a survey of the coast of Sussex to be made with a view of defence. Then it was suggested that Pevensey Castle should be "re-edified or utterly razed," but neither appears to have been done.

The erection of the castle resulted in the original "floor" of the area being covered with a bed of stiff clay, and the seekers after Roman remains have in that an obstacle which makes the work of excavation difficult and more expensive than it would otherwise have been. The walls on the outside are between 24 and 30 feet high, yet so much clay has been dumped inside that it is but a few feet from the wall tops in some places. The digging of the moat accounts for some of the accumulation, but where the greater part of it came from is a mystery at present.

Numbers of Roman coins have been found among the ruins, and possibly more may now be dug up. In this connection it is interesting to note an attempted fraud about 1850. A man buried considerably over 800 sham coins in the ruins, and then reported that he had hit upon a "find." He made the fatal mistake, however, of burying them in a tower built in the reign of Edward II., and the numismatic gentlemen became suspicious and found him out. Many a house in the neighbourhood is indebted to the old fortress for its walls, as it served as a "quarry" for years. Stout brick buttresses were then found necessary to repair and prevent further damage. The kind permission of the Duke of Devonshire, the owner, and of Mr. William Elphick, the tenant, was extended to the excavators to carry on the work.

The Finance Committee of the Wilts County Council recommend that the County Council appoint Mr. Alfred Dryland, county surveyor of Herefordshire, to the office of county surveyor for Wilts at a salary of 500*l.* per annum, and that failing the acceptance of this appointment by Mr. Dryland, Mr. Joseph Slater, assistant county surveyor of Lancashire, be appointed.

A NEW LONDON STREET.

THE improvements committee of the London County Council have prepared the following report:—

We desire to bring to the notice of the Council a favourable opportunity for effecting an important improvement in the neighbourhood of the British Museum. The Duke of Bedford has offered to surrender, free of cost, about 53,600 square feet of land for the construction of a new street from Torrington Square along the course of Torrington Street, crossing Keppel Street and leading into Montague Place. The length of the street will be about 440 feet, and its width 130 feet, except at its junction with Montague Place where it will open out into a circus having a diameter of about 200 feet. The offer to surrender the land is made subject to His Grace being relieved of the cost of paving, &c., the land so surrendered. The cost of these works is estimated at 10,000*l.*, of which 6,000*l.* is the cost of paving the new street and 4,000*l.* the cost of altering the levels of Montague Place. The proposed improvement, by opening up an alternative route to Tottenham Court Road or Gower Street, or Upper Woburn Place and Southampton Row, will tend to relieve very materially the traffic in those thoroughfares. Greatly increased facilities will, we think, be afforded for the heavy traffic from the railway termini at Euston, St. Pancras and King's Cross and the districts beyond to pass through the central parts of Bloomsbury, and thence by the streets on either side of the British Museum, along Shaftesbury Avenue to the West End, or along Endell Street and Bow Street to Waterloo Bridge. We need not emphasise the importance of providing alternative routes, such as that now suggested, to existing thoroughfares. The present proposal may be regarded as an important section of an imposing thoroughfare, broader than any existing street in the central parts of London, between Euston Road and New Oxford Street. As the section now suggested forms an improvement complete in itself, there would be no necessity to press on with the remainder of the scheme until a favourable opportunity presented itself.

In connection with and bearing upon this improvement we desire to call attention to the following facts. The Trustees of the British Museum have recently acquired the property needed to extend the Museum buildings—on the west to Bedford Square and Charlotte Street, on the north to Montague Place and on the east to Montague Street—and the Trustees propose to undertake at once that portion of their scheme which consists of the extension northwards as far as Montague Place of the existing Museum buildings. The cost of acquiring the property mentioned above and of the works about to be commenced is estimated at 400,000*l.* Of this sum the greater part has been granted by H.M. Government; the balance will be met out of a private bequest. A deputation from the Trustees, consisting of Viscount Dillon, Viscount Peel, Sir John Evans and Mr. Cavendish Bentinck attended before us and urged that the Council might be advised to co-operate with the Duke of Bedford in forming the proposed new street from Torrington Square to Montague Place, so as to secure a worthy approach to the north side of the Museum in place of a row of houses which would otherwise shut in the view of the building. From the detailed plans shown to us by the Trustees it is clear that the Museum is destined to be one of the finest buildings in London, and we feel sure that the Council, as representing the whole of London, will wish to do all within their power to insure that this building shall be approached by suitable thoroughfares, particularly as this result can be combined with the provision of greatly improved traffic facilities.

It is not our practice to advise the Council to contribute towards the formation of streets on private estates, as in such cases it is usually found that the increase in value of the remaining property exceeds the value of the land surrendered and the cost of the incidental works. But the case of the present improvement is, in our opinion, exceptional, inasmuch as we are advised that, although the improvement will undoubtedly enhance the value of the Duke of Bedford's adjoining property, such enhanced value will probably not equal and will certainly not exceed the value of the land to be surrendered.

The suggested improvement will assist the local traffic as well as the general through traffic, and we therefore think it right that the Holborn Metropolitan Borough Council should bear some proportion of the cost. If the Council bears the cost (6,000*l.*) of paving the new street, and the Borough Council the cost (4,000*l.*) of altering the levels of Montague Place, we think that such an arrangement would be equitable. We have not yet communicated

with the Borough Council, but we propose to do so at once if the Council adopts our recommendation.

We have caused to be hung in the Council chamber a cartoon plan showing by red colour the proposed improvement, and we recommend:—(a) That the estimate (No. 5518) of expenditure on capital account of 6,000*l.* submitted by the finance committee in respect of the Torrington Square to Montague Place improvement, shown on the plan (Registered No. 769), be approved. (b) That, subject to the alteration of the levels of Montague Place being undertaken at the cost of the Holborn Metropolitan Borough Council, expenditure not exceeding 6,000*l.* be sanctioned in respect of the cost of paving, &c., works in the new street from Torrington Square to Montague Place.

The finance committee are not advocates of the proposal, for they say that, having considered the estimate in its financial bearings, they submit the same as chargeable to capital (original outlay) account. The Duke of Bedford has offered to surrender, free of cost, the necessary land for the construction of the proposed new street from Torrington Square to Montague Place. The cost of forming the carriageway and footways of the street is estimated at 6,000*l.* The cost of altering the existing levels of Montague Place is estimated at 4,000*l.*, which it is suggested should be borne by the Holborn Metropolitan Borough Council. The total estimated cost of the improvement is, therefore, 10,000*l.* It is for the improvements committee to justify the proposed apportionment of the cost of the improvement between the Council and the Borough Council, but apart from any question which may arise thereon they are of opinion that, having regard to the heavy capital commitments of the Council and to the present condition of the money market, the Council should carefully consider whether the proposed improvement should not be abandoned, or, at any rate, postponed for the present. The finance committee regret to have to report in these terms, as they recognise that the new street would make a fine approach to the extension of the British Museum, which is about to be erected. It is not proposed that any part of the cost should be contributed by the Government or by the Trustees of the British Museum.

TESSERÆ.

Geometry of the Hindus.

THE researches of the learned have brought to light astronomical tables in India which must have been constructed by the principles of geometry, but the period at which they have been formed has by no means been completely ascertained. Some are of opinion that they have been framed from observations made at a very remote period, not less than 3,000 years before the Christian era; and if this opinion be well founded the science of geometry must have been cultivated in India, to a considerable extent, long before the period assigned to its origin in the West, so that many of the elementary propositions may have been brought from India to Greece. The Hindus have a treatise called the *Surya Sidhanta*, which professes to be a revelation from heaven communicated to Meva, a man of great sanctity, about four millions of years ago; but setting aside this fabulous origin it has been supposed to be of great antiquity and to have been written at least two thousand years before the Christian era. Interwoven with many absurdities this book contains a rational system of trigonometry, which differs entirely from that first known in Greece or Arabia. In fact, it is founded on a geometrical theorem which was not known to the geometers of Europe before the time of Vieta, about two hundred years ago. And it employs the sines of arcs, a thing unknown to the Greeks, who used the chords of the double arcs. The invention of sines has been attributed to the Arabs, but it is possible that they may have received this improvement in trigonometry, as well as the numeral characters from India. The only fact here asserted which bears upon the question of the civilisation of the Hindus is that of their using the sines of arcs instead of the chords of the double arcs. Suppose that they invented this method. It proves nothing beyond what all men believe—that the Hindus made a few of the first steps in civilisation at an early period, and that they engaged in those abstract speculations, metaphysical and mathematical, to which a semi-barbarous people are strongly inclined. The Arabians were never more than semi-barbarous. The Greeks were no better at the early age when they were acquainted with the elementary propositions of geometry. If the Greeks or Arabians invented in the semi-barbarous state the mode of

computation by the chords, what was to hinder the Hindus from inventing while semi-barbarous the mode of computing by the sines of arcs? This is upon the supposition that the mode of computing by sines and the elementary propositions on which it depends really are original among the Hindus. But this seems not to rest upon very satisfactory proof, when it is barely inferred from the use of chords by the Greeks; and the possibility alone is asserted of the Arabians having derived the knowledge from the Hindus.

Leo Baptista Alberti.

Leo Baptista Alberti was a man who, if measured by the universality of his genius, may claim a place in the Temple of Glory he has not filled. He was the author of a Latin comedy, entitled "Philodoxios," which the younger Aldus Manutius afterwards published as the genuine work of a certain ancient Lepidus; a moral writer in the various forms of dialogue, dissertation, fable and light humour; a poet, extolled by some, though not free from the rudeness of his age; a philosopher of the Platonic school of Lorenzo; a mathematician and inventor of optical instruments; a painter and the author of the earliest modern treatise on painting; a sculptor and the first who wrote about sculpture; a musician whose compositions excited the applause of his contemporaries; an architect of profound skill not only displayed in many works, of which the church of St. Francis at Rimini is the most admired, but in a theoretical treatise, "De Re ædificatoria," published posthumously in 1485. It has been called the only work on architecture which we can place on a level with that of Vitruvius, and by some has been preferred to the latter. Alberti had deeply meditated on the remains of Roman antiquity and endeavoured to derive from them general theorems of beauty variously applicable to each description of buildings. This great man seems to have had two impediments to his permanent glory—one, that he came a few years too soon into the world, before his own language was become polished and before the principles of taste in art had been wholly developed; the other, that, splendid as was his own genius, there were yet two men a little behind in the presence of whom his star has paled, men not superior to Alberti in universality of mental powers, but in their transcendancy and command over immortal fame, viz. Leonardo da Vinci and Michel Angelo.

Followers of Michel Angelo.

The school of Michel Angelo, properly so called, consisted of the following disciples:—Raphael di Monte Lupo, a favourite pupil of his master, by whom are two statues in the tomb of Julius II., one on each side of the Moses; Nicholo di Tribulo, an excellent founder, whose best performances are the gates of San Petronio, at Bologna; Giovanni dell' Opera, a most prolific artist—the statue of Architecture on the tomb of his instructor is deservedly praised; Benvenuto Cellini, famous alike by the productions of his pen and his chisel, and by the romantic incidents of his life—the bronze statue of the Perseus is his well-known masterpiece; Vincenzo Dante so closely imitates the style and manner of his master that the labours of the former are sometimes attributed to the latter; Bartolomeo Ammanato is esteemed as an architect, but as a sculptor he scarcely attained mediocrity. Lastly, of all the scholars of Michel Angelo, from the number and magnitude of his works, the beauty of his style and the excellence of his genius, Giovanni di Bologna is deservedly celebrated as the most illustrious. This artist occupies a prominent station in the history of sculpture, and more particularly in the Florentine school, from the death of his master to the end of the sixteenth century, and closed the series of great names with which that period was adorned. The group of Hercules and Centaur, one of his most esteemed and latest works, was placed on its present site at Florence late in 1600. In examining his performances we ascertain the advances effected in the art during the last thirty years of the present era. From the death of Buonarroti the technical part is considerably improved, mechanical operations better understood and consequently execution facilitated. Hence in the works of Giovanni we discover no deficiency of a high and, in some instances, exquisite finish, although no preceding sculptor can boast of productions so numerous or more important. But even in his manner we observe the growth of those evils which the example of his instructor introduced—bold, rapid and masterly execution; grand and imposing composition preferred to delicacy of expression, truth of feeling, and attention to the study of nature. The deterioration is of course still more apparent

in the works of inferior imitators, who failed to acquire those nobler qualities by which the errors and extravagances of mightier spirits are redeemed.

Herculaneum Manuscripts.

Some of the manuscripts found at Herculaneum are of one palm high, others two or three, and the rolls which they carry are nearly four fingers thick, though some are only half a palm. They are, generally speaking, burnt to a cinder, and, according to the exterior, might be taken for petrified wood. As to square books in our fashion not a single one occurs. These manuscripts were written on Egyptian paper, and by the examination of many which are less dry and wrinkled, and which notwithstanding were rolled as close as they now appear, they have not been compressed by the heat into a smaller bulk than that which they now occupy. A roll of this sort is formed of many pieces, thin and as large as the hand, which, being fastened at the end of each other, form at their junction a fold of a finger's breadth, and are so well united that nothing is capable of severing them. The ancients had artisans called glutinatores, whose profession it was to paste these leaves, and they must not be confounded with common workmen, for the Athenians elevated a statue to one Philtatus, who had taught them the art of pasting the manuscripts, or, what appears more probable, had invented a kind of paste proper for books. Some of these rolls, composed of many pieces pasted together, were simply curled up; others had a tube of wood or bone (the umbilicus) round which they were entwined (like our pendulous maps and charts); others have been presumed to have had two, and both appear in a painting of Herculaneum, but no second tube occurs. They were opened and read as we should do pedigrees. The manuscripts are written upon one side only, and the written side is placed in the interior of the roll. Winckelmann concludes that manuscripts written on both sides were executed upon double or doubled paper. All these works are written in columns about four fingers broad, i.e. occupying as much space as a Greek verse of 6 feet. One column contains in some MSS. forty lines and in others forty-four. Between the columns the space of a finger is left blank. The columns have been framed in red lines, as usual with many books in the first copies. There is no appearance, as upon parchment, of ruled lines to direct the writing; but as the paper was exceedingly fine, and appears to have been transparent, they used a leaf of ruled paper beneath. Pliny speaks of manuscripts written upon double paper, i.e. composed of two leaves pasted upon each other, so that one of these leaves was placed upon the length and the other upon the breadth, and the grain of the paper was crossed.

The Cathedral Series.

SIR,—Having been a regular subscriber to *The Architect* for many years, I shall be very glad if you can inform me if your promise to the subscribers still holds good in regard to the publication of further plates of your splendid series of the cathedrals. Some time back—I forget the exact date—you stated in reply to a correspondent that you would publish additional plates of some at the end of the series. Some of the finest buildings have the fewest plates, viz. Ely 6, Lincoln 6, Norwich 7, Salisbury 10, Southwell 6 and Winchester 6, double sheets. My reason for asking for information is that I intend binding them in separate folios in alphabetical order, and I cannot proceed in arranging them at present. Also, do you intend to include the abbeys, ruined or otherwise, in the series? Some of your announcements include them and some do not. Trusting that I am not troubling you too much, I remain, yours truly,

H. FREDERICK.

11 Brynland Avenue, Bishopston, Bristol:
November 26, 1906.

[We publish this letter, as there seems from other letters we have received from time to time to be some doubt as to our publishing further views of the cathedrals referred to. We shall keep our word to our subscribers, and other views will appear at the end of the series. We have not yet decided about the abbeys, but will make an announcement later on.—Ed.]

GENERAL.

The Secretary of State for India in Council will, in the summer of 1907, make not less than twelve appointments of assistant engineers in the permanent establishment of the Indian Public Works Department.

Mr. W. J. Barry, a member of the Gaelic League, has been elected county surveyor of Sligo. The salary is 400*l.* a year. There were nineteen applications.

A Painting by the late Eugène Boudin, *Between the Piers, Trouville*, has been presented to the National Gallery by M. Van der Velde, of Havre.

The Receipts of the Société des Artistes Français amount for the past year to 320,841 francs. The funds will enable the Council to open the "Maison de Retraite" for artists offered by M^{me}. Jules Comte.

The Landlord of the Angel and Royal Hotel at Grantham has to pay yearly the sum of 40*s.* for a sermon to be delivered in the parish church against drunkenness, the preacher receiving the money. This is in accordance with the bequest of one Michael Solomon made in the year 1706. The two hundredth sermon was delivered on Sunday last.

Mr. J. A. Morris, architect, delivered a lecture on Monday on "The Application of Art to Industry," under the joint auspices of the architectural section of the Royal Philosophical Society and the Glasgow Architectural Association, in the rooms, Bath Street, Glasgow.

Mr. Imrie Bell, civil engineer, died recently at Croydon. In 1878 he joined the London office of Messrs. Bell & Miller. He moved to Glasgow in 1887, and became sole partner. He was associated with several engineering works in the West of Scotland, notably with bridges, one of the latest being the Great Western bridge over the river Kelvin. He was elected a member of the Institution of Civil Engineers in 1868, and read two papers earning the Telford premium in 1869.

The Maidstone Corporation, by the casting vote of the Mayor, at a meeting from which several members were absent, decided on Wednesday to entrust to the borough surveyor the work of planning and supervising the erection of the new elementary school to be built in St. Michael's district, instead of employing an architect.

The Council of the Senate of Cambridge University have received a largely-signed memorial requesting them to appoint a syndicate to consider the advisability of instituting a diploma in architecture, in view of the great importance of architectural studies, which has already been felt in other universities, where such studies have been successfully organised.

An Appeal is being made to the Kent Archæological Society to investigate the unsolved problem of an underground chamber at Richborough, near Sandwich, the ancient Rutupia of the Romans. It has been variously suggested that the works were intended as foundations for a large lighthouse or other building, as a reservoir, or as a strong room for treasure.

Mr. Henry A. Prothero, M.A., architect, died on Monday in his fifty-eighth year at Cheltenham. Mr. Prothero was a pupil of the late John Middleton, architect, and later on joined the firm of Middleton, Prothero & Phillott. He designed churches at Leeds, Carmarthen, Aberystwith and other places, and carried out restoration work at many ancient churches both in England and in Wales. From his plans the new chapel was erected as a memorial of the jubilee of Cheltenham (boys') College. He also designed the Delancey Fever Hospital and other buildings in and near Cheltenham.

Mr. Frank Craig, whose *Heretic*, which was exhibited at the last exhibition of the Royal Academy, was purchased through the Chantrey Bequest, has, with the sanction of the committee, made a replica for a private purchaser.

The Erection of the Wood Green Baptist church building has now been started, the contractors being Messrs. H. Knight & Sons. The contract amount is 4,620*l.* The accommodation provided is for 500 persons, all on the ground floor. The architects are Messrs. George Baines & Son, 5 Clement's Inn, Strand.

A Provisional Committee has been formed for the purpose of purchasing Mr. Holman Hunt's latest picture, *The Lady of Shalott*. A gift of 250*l.* has been promised on condition that nine other sums of a like amount were subscribed. It is hoped that a great deal of the necessary sum may be raised by donations of not less than a guinea.

An Exhibition by the pupils attending the Glasgow School of Art under the Board of Manufactures opened in the galleries of the Royal Scottish Academy on Saturday. In one section devoted to the National Art Survey of Scotland the work of the students is shown in the form of complete records of plans, so that in the event of a valuable building being destroyed these plans would be available for a restoration. Coldingham Priory, the old palace at Culross, Melrose Abbey, St. Michael's Church, Linlithgow, and Elgin Cathedral have been undertaken, and the drawings are hung in the north octagon. The majority of the Scottish cathedrals have also been under survey, and the records are bound to be of great value.

At the Recent Sale of Aboyne Castle pictures, in Aberdeen, one of the works disposed of was entitled "The Village Festival," which was attributed to D. Teniers. On the picture being cleaned, it was found that, instead of being a Teniers, it bore the signature of Jan Steen. Some correspondence on the subject has taken place with the National Gallery authorities, and experts who have seen it are of opinion that it is a fine example of Steen's work. The picture was bought for 10*l.* at the sale about two months ago.

As a Result of exposure to the weather for such a considerable period one of the Norman arches in front of the Royal Grammar School at High Wycombe has collapsed. The old arches, of which three still remain, are regarded as among the finest relics of Norman Domestic architecture in England.

Mr. Charles A. Jones, deputy constable of Carnarvon Castle, has received definite information from His Majesty's Office of Works that the sum to be applied to the scheme for restoring the castle would be 7,000*l.* There is no intention of making any part of the building habitable, but merely to maintain the existing state of the fabric.

The Surveyors' Institution have awarded the Council gold medal, session 1905-6, to Mr. W. R. Baldwin-Wiseman, M.Sc., F.G.S., A.M.I.C.E. (professional Associate), for his paper entitled "The Effect of Fire on Building Stones," read at the ordinary general meeting of May 14 last.

Selby Abbey.—In aid of the fund for the restoration of Selby Abbey, a recital will be given at St. Matthias's, Stoke Newington, after evensong on Sunday, December 2, by the organist of Ripon Cathedral, Mr. C. H. Moody. Before the High Celebration on the same day, at 11 o'clock, the Litany by Henry Loosemore, organist of King's College Chapel, Cambridge, 1627-70, will be sung in procession. Aided by the ecclesiological knowledge of Mr. T. Francis Bumpus, the well-known writer on English and Continental church architecture, the music at St. Matthias's, one of Mr. Butterfield's most strikingly original churches, has increased in richness and correctness under the present energetic organist and choirmaster, Mr. F. T. Kennard. The organ, one of the late Henry Willis's early works, is that upon which Dr. W. K. Monk, so widely remembered as musical editor of "Hymns Ancient and Modern," played from 1853 to 1889.

The Sheffield City Council decided some months back to erect new public baths at Primrose Meadows, and invited architects practising within the city boundaries to submit schemes. They also invited and appointed Mr. J. Lane Fox, architect, of Oxford Place, Leeds, as their expert adviser, to conduct the competition and act as assessor. As a result seventeen schemes have been sent in and adjudicated by Mr. Fox, who has placed scheme No. 8, submitted by Mr. A. Nunweek, first; No. 14, by Messrs. Charles Hadfield & Son, second; and No. 9, by Messrs. Potter & Sandford, third in order of merit.

The City of Birmingham will receive up to December 5 applications from local architects who desire to submit competitive designs for public baths at Nechells.

The Causes of the fifty-three fires which occurred in Glasgow during the four weeks ending the 13th inst. were:—Defective building construction, twenty-three—all in properties erected before the passing of the Building Regulations Act, 1892; dropped lights, six; curtains and goods in contact with lights, three; tobacco-smoking, escape of gas, heat from flues and sparks from fire, two each; friction of machinery, defective electric-light installation, fat boiling over, children playing with lights, candles and hot ashes, one each; and unknown, six. There were three malicious alarms.

The Architect.

THE WEEK.

AN instance of collision between a local authority and the London County Council which arose at this week's meeting is of grave import, for it may lead to costly litigation. The Marylebone Borough Council have authority over Oxford Street, and between the Marble Arch and Tottenham Court Road are erecting electric-light standards on refuges at distances varying from 20 to 160 yards apart. Both the refuges and the lights are a great convenience to foot passengers. Indeed, the statement has been often expressed that similar facilities for aiding the passage from one side of a thoroughfare to another would be a great improvement if more generally employed. The Royal Commission on London traffic, however, considered that cab-ranks, refuges, standard-lights were all obstacles to free and rapid movement in the streets. In other words, the Commission desired that the streets of the Metropolis should resemble railways, and that traffic should pass in up and down lines. The County Council agree in principle with the Traffic Commission, and desire that obstruction should be prohibited. The highways committee, therefore, proposed that the Council should protest against the placing of lamp standards in the centre of Oxford Street, and that power should be sought in the session of 1908 to enable the Council to deal with cases of obstruction by the erection of obstacles in the carriage-way. Sir T. BROOKE-HITCHING said that the true meaning of the recommendation was that the committee desire to run tramways along Oxford Street. The recommendation was, however, adopted. Oxford Street is only a test case, and we suppose it will be accepted that the carriage-ways in the principal streets are to be reserved for tramways, carriages, waggon, &c. alone.

It is very hard on lessees in London when towards the close of their tenure efforts are made to treat their houses as dangerous structures and to be taken down, secured or repaired at their expense. However great may be the outlay in the majority of cases, it would not necessarily lead to a renewal of the lease. A case of the kind in Lambeth came a few days ago before Mr. CURTIS BENNETT at the Westminster Police Court. Several houses in Wake Street were certified by the district surveyor to have front and back walls which bulged and were otherwise defective, and an order was sought to have them taken down. The houses were, however, unoccupied during several months, and they had been shored with heavy timber. The leases will expire in two years and a half. The representative of the County Council argued that shoring with timber was not held by the Act to be a removal of danger. The magistrate said that he considered the premises had been "secured," for the district surveyor admitted that by means of the shoring they might stand for a century. The magistrate therefore adjourned the summons for three months, and suggested that if at the end of that time the shoring remained secure it would be better to withdraw the proceedings. The case is really another example of the pernicious effect of the leasehold system. The builders of our time were not the first to discover how houses can be erected to serve for a definite period and no longer. The Wake Street houses have fulfilled their purpose within two or three years of the time specified, and that shows a rather exact knowledge of the endurance of materials.

ALTHOUGH the London County Council on Tuesday confirmed the decision arrived at in October 1903, to the effect that no alteration be made in the present northern line of frontage of the Strand between Wellington Street and the Law Courts, a great many

people will still continue to believe that a modification of the frontage may be approved. The proposals for amendment were all costly, ranging from 58,000*l.* to 249,000*l.* The most economical was that of the Council's architect. The Council state that the scheme which they have adopted embraces the suggestions of the Royal Institute of British Architects with slight modifications. They also declare that "we are not convinced that by throwing open to view various portions of the Law Courts building and of the church of St. Mary-le-Strand the architectural effect in the Strand would be considerably enhanced, and indeed there are objections to the proposal from the architectural point of view. After the most anxious consideration of the matter and with the greatest desire to give the fullest weight to the views of the distinguished artists who have favoured the Council by their views, we feel that the Council would not be justified in incurring the heavy loss which would be involved in securing a doubtful enhancement of the architectural view in the Strand. Having regard to the great width already provided (100 feet), it will be possible to secure under the Council's scheme an imposing effect for the buildings to be erected on the northern side of the Strand." The proposal to have the subject referred back to the improvements committee, in order to report as to the possibility of adopting the plan suggested by the Council's architect, was rejected on Tuesday, and a large majority decided that no alteration is to be made. If some projectors came forward who would be willing to treat for the land on an amended line there would probably be no difficulty in meeting their views.

AN exhibition of several works by Mr. HOLMAN HUNT was opened on Tuesday at the City Art Gallery, Manchester. The artist, who was present, recalled some of his own reminiscences of Manchester, and then narrated the circumstances connected with the early days of pre-Raphaelitism. What was for many the most interesting part of the discourse was his explanation of his treatment of *The Lady of Shalott*. It was charged against him, he said, that the picture was not painted by him. In the illustration in TENNYSON'S Poems which appeared in 1857 the figure is seen without any regard to elaborate light and shadow. That would be unnecessary in a book where all that was desirable was to suggest that the web which she had been weaving became like a spider's web and she was caught in her own toils. All that could be done by lines alone. But in the larger painting something more was sought after. Nineteen years ago it was commenced, and had been seen by MILLAIS, BURNE-JONES and ARMSTEAD. Several other witnesses examined it at that time, and there was not a line in the picture which had not been more or less prepared or developed then. But when Mr. HOLMAN HUNT's sight became affected he found that although he could distinguish the different hues of every colour on the palette and could tell the forms when looked at singly, yet he found it desirable to have an assistant by him to make sure the colours had blended before they dried. For that purpose he obtained the aid of Mr. E. R. HUGHES, A.R.W.S. If there is one quality more characteristic than another of Mr. HOLMAN HUNT it has been his veracity. It was the attempt to express that quality to an extent that was impossible which made so many of his pictures appear wanting in artistic qualities. It is therefore a saddening spectacle, and one which is enough to drive a sensitive painter to despair, to find such a man as HOLMAN HUNT, in his seventy-ninth year, explaining to the public that he was no REINAGLE endeavouring to put forth another man's painting as his own. The people of Manchester must have been convinced by his simple statements, and we hope *The Lady of Shalott* will be acquired by the nation, if it were only to show that slander is not appreciated in this country.

SPENCE AND LESSING.

THE name of JOSEPH SPENCE is not remembered among his countrymen. Yet he was for ten years Professor of Poetry at Oxford. He was an intimate friend of POPE, about whom he wrote, and he has left an interesting collection of anecdotes concerning that poet and other *literati* of the eighteenth century. One of the reasons of the failure to appreciate SPENCE in our time arises from the belief that he was the author of a folio volume which LESSING, the German writer, is supposed to have completely demolished. A defeated author cannot expect pity or fame. SPENCE'S "Polymetis: or an Enquiry concerning the Agreement between the Works of the Roman Poets and the Remains of the Antient Artists," was one of the causes which induced LESSING to write the "Laokoon"—a small volume which GOETHE, MACAULAY and others have declared was most influential in their mental development. While the German book must be admired as a surprising *tour-de-force*, it does not follow that it was in reality so deadly in its attacks on SPENCE'S theory. For the sake of fair play towards the earliest English writer on Classic archæology judgment should not be allowed to go by default, as has been hitherto the case, and our readers will not, we hope, object to a brief statement of some of the circumstances which have made LESSING appear more of a victor than he was in reality.

LESSING, we need not say, was the pioneer of modern German literature. HEINE did not hesitate to place him as coming next to MARTIN LUTHER in influence, and there was a sturdy courage and independence in the two which made them akin. But with all his power, LESSING'S hopes of obtaining a livelihood by scholarship were uncertain. There was not sufficient demand for German books to support him. He therefore resolved to apply for the post of librarian to FREDERICK THE GREAT, the king who was supposed by advanced Germans to be the hope of the country. LESSING wished to demonstrate the extent of his erudition in the hope of winning the favour of a practical man like the King of PRUSSIA. The most fruitful subject he could find related to the connection between the arts and literature, and accordingly he resolved to complete a work he had commenced entitled the "Laokoon."

JOSEPH SPENCE had already published his "Polymetis"—a series of dialogues in folio which he had adorned with copper-plates by VERTUE, BOITARD, and others. The object of SPENCE was to impart greater interest to the study of criticism and antiquities. In his time, as he said, criticism generally appeared as a mere scold and antiquity as an old pedant. SOCRATES was able to give an agreeable turn to his lessons and morals, and he was imitated by HORACE. "Something like this," said SPENCE, "might be practised in treatises of criticism and antiquities; and though I may have failed entirely in attempting it, I cannot help thinking that I have at least given no bad hint for someone that may come after me, who I hope may succeed much better in it than I have done." SPENCE, we should remember, was a Professor of Poetry, and it was only right that he should endeavour by every means to make his students take deeper interest in the subjects he taught. Confining himself to Roman writers, he could not help observing that they often appeared to be referring to works of art, and that there was a remarkable correspondence between the poets' descriptions and the works of contemporary artists, and which could be demonstrated by the aid of engravings.

He therefore supposed that a few friends used to meet in a rotunda erected by POLYMETIS, and there discussed his statues, drawings and engravings of ancient works of art. It was essential to begin with an account of ancient Rome, and the picture of the city, although confirmed by later archæological inquiries, must have seemed amazing to those whose ideas of the

capital were derived from the grandiose descriptions given in the playhouse:—

The city of Rome, as well as its inhabitants, was in the beginning rude and unadorned. Those old rough soldiers looked on the effects of the politer arts as things fit only for an effeminate people, as too apt to soften and unnerve men, and to take from that martial temper and ferocity which they encouraged so much and so universally in the infancy of their State. Their houses were (what the name they gave them [tectæ] signified) only a covering for them, and a defence against bad weather. These sheds of theirs were more like the caves of wild beasts than the habitations of men, and were rather flung together as chance led them than formed into regular streets and openings. Their walls were half mud, and their roofs pieces of boards stuck together; nay, even this was an after improvement, for in Romulus's time their houses were only covered with straw. If they had anything that was finer than ordinary, that was chiefly taken up in setting off the temples of their gods; and when these began to be furnished with statues (for they had none till long after Numa's time) they were probably more fit to give terror than delight, and seemed rather formed so as to be horrible enough to strike an awe into those who worshipped them, than handsome enough to invite anyone to look upon them for pleasure. Their design, I suppose, was answerable to the materials they were made of, and if their gods were of earthenware, they were reckoned better than ordinary, for many of them were chopped out of wood. One of the chief ornaments in those times, both of the temples and private houses, consisted in their ancient trophies, which were trunks of trees cleared of their branches and so formed into a rough kind of posts. These were loaded with the arms they had taken in war, and you may easily conceive what sort of ornaments these posts must make when half decayed by time and hung about with old rusty arms, besmeared with the blood of their enemies. Rome was not then that beautiful Rome whose very ruins at this very day are sought after with so much pleasure; it was a town which carried an air of terror in its appearance, and which made people shudder whenever they first entered within its gates.

It is then shown how the Romans were at first indifferent about the sculpture which they found in the Greek cities they captured. They were afraid of the consequences of reverencing foreign deities, and they looked on art as opposed to the martial spirit and natural roughness they considered it desirable to preserve. FABIVS MAXIMUS, when he took Tarentum, sent away the gold and silver to Rome. But the colossal figures of the battles between the gods and the giants he left behind, saying, "Leave the angry gods to the Tarentines; we will have nothing to do with them." Soon afterwards the younger Romans preferred the conduct of MARCELLUS to that of FABIVS. For MARCELLUS wished to adorn the temples, porticoes and public places with the works of art derived from Greek cities. As a consequence CATO, the censor, was heard complaining about the ridicule cast on the poor old Roman gods who had hitherto been so propitious to them, and who would continue to be friendly if they were not displaced from their pedestals by foreign gods from Corinth and Athens. Now SPENCE maintained that it was possible to see a correspondence between this growing love of art and similar changes in contemporary poetry. He pointed out that certain attributes which were introduced in verse were likely to have been suggested by sculptured figures, and that often there was a remarkable correspondence between the poet's descriptions and existing statues or gems. But there was no ground for suggesting that SPENCE asserted the precedence of the sculptor to the poet. He mentions the old legend about PHIDIAS declaring that he was indebted for his conception of ZEUS or JUPITER to the description of the god given by HOMER. SPENCE considered that some gods were endowed with local characteristics more prized in certain districts than elsewhere and these the poets would describe. The Greek JUNO does not correspond with the Roman JUNO, and the same would be the case with MINERVA and others. The artists who worked for Roman patrons would naturally act in the same way, and would introduce local associations. But all this is very different

from asserting that the poets depended entirely upon the sculptors for inspiration.

LESSING acknowledges that SPENCE often succeeded in extracting from the Roman poets solutions of ancient works of art which hitherto had been unexplained. He testifies to the English professor's classical learning and to his intimate acquaintance with works of ancient art. But in spite of all this SPENCE's book should be, according to LESSING, intolerable to every reader of taste. When we ask what particular example justifies this condemnation, we find it consists simply in a different theory which LESSING held about the introduction of thunderbolts on Roman shields. But when one analyses the argument we discover that LESSING has no definite opinion on the subject. The Englishman gives engravings; LESSING cannot say they are forgeries, and he is not able to bring other examples forward which would support his own views. Another instance of the curious spirit in which LESSING acts towards SPENCE relates to the goddess VESTA. Although he was describing an imaginary symposium and fictitious statues SPENCE was careful to avoid all exaggeration, and especially the tempting one of appearing to know more about sculpture than his experience had taught him. POLYMETIS, in describing his gods and goddesses, has to explain why he does not possess one of VESTA, and he says:—

• I have not yet got any statue of Vesta, who, if ever she should honour my collection with her presence, ought to stand here next to Vulcan. To tell you the truth, I have some doubts whether the figures that are generally looked upon as Vestas do really represent that goddess or not. There is nothing I think about such as I have seen which would not be as proper for one of the Vestal Virgins as for the goddess who presided over them, and who knows whether the figures that are called Vestas, even in the inscriptions of the artists who made them, may not signify only one of the virgins who kept her eternal fire? What first led me so far out of the common road of thinking was a passage in Ovid, which expressly says they had no personal representations of this goddess. To which I may add a thing which would otherwise have appeared very unaccountable to me. I have formerly, I think, told you that I took the pains to read over all the Roman poets, from the fragments of Livius Andronicus to the satires of Juvenal, and to mark down the most striking passages in them which any way related to the figures and appearances of any of the imaginary beings received as gods among the Romans. When I came to put these collections in order and to range them under their proper heads, I found I had but one single passage out of all of them relating to Vesta. This single passage was from Ovid. I would not hence absolutely assert that the ladies which are called Vesta in several pieces of antiquity are only representations of this goddess by proxy, but it is enough to make one doubt. And as I am still in some doubt about it, I have not yet placed any figure of her in this line of the other Great Deities her companions.

SPENCE in these words only expresses the anomaly which still continues. HESTIA or VESTA was worshipped throughout Greece as the great domestic goddess. Yet it is doubtful whether anywhere in the whole extent of the country there was a single temple in her honour. NUMA erected one in Rome. It is evident that SPENCE was keeping religiously to facts. LESSING answers him not by facts but by mockery. SPENCE does not say there was no figure of VESTA, but that he had never met with one. LESSING says that he had no grounds for drawing the marvellous conclusion that artists abandoned the right to represent the goddess. And then he goes on to mention the number of cases of figures of the goddess which fell from the sky, and of a figure that used to lift its eyes with shame whenever any crime was committed against her, and if the figure had certain attributes it was the goddess and not a priestess. All this ingenious special pleading merely reveals that LESSING had no acquaintance with sculpture either ancient or modern, and that he was endeavouring to supply its place by something drawn from his inner consciousness. Yet it was by such strokes SPENCE's

able book was cast aside and has remained neglected for a century and a half.

It was not within SPENCE's province to treat of such a group as the *Laokoon*, and it could not therefore be said that he had started any theory about the figures which LESSING was bound to oppose. But the German writer, observing there was a difference between the group and the description by VIRGIL of the attack on the priest, felt he was bound to repel all those who would advocate even an accidental relation between sculpture and poetry. Hence the attack on SPENCE. But the English writer had never maintained that poetry was to be subservient to sculpture, although it was allowable for the two to treat the same incident or for a poet to describe the works of a sculptor.

THE PARIS PANTHEON AND ST. PAUL'S.

IT was at one time believed by the majority of foreigners that a great change came over Englishmen in November, of which a common result was suicide. In modern times there is fortunately a less general desire for seeking a quietus. But it must be allowed that things in general assume a different aspect in the eyes of Englishmen with the commencement of winter. This may account for the exaggerated statements heard of late about the condition of St. Paul's. WENDELL HOLMES used to say that if a man were declared to be suffering from two or three incurable diseases, according to the opinions of experts, he might take it for granted that he was destined to live a great many years. A similar phenomenon is witnessed in buildings. They may be declared defective in construction, but they contrive to keep together. And it is only under extraordinary circumstances that the lath-and-plaster structures which abound in London suddenly collapse and give rise to surprise that they have held so long together. Although St. Paul's may be in imminent danger, there are other churches and public buildings which have suffered in the same way, and yet with or without repairs they serve their purposes. One remarkable instance is the great domed building in Paris now known as the Panthéon.

LOUIS XV. was known as the *Bien-aimé*. He received the title because when he was ill at Metz in 1744 Paris was all in terror, and seemed like a city taken by storm. The churches resounded with supplications and groans, and the prayers of priests and people were interrupted by sobbing. All this and much else is related by CARLYLE. Having recovered, LOUIS felt he was under an obligation to create a thankoffering. And when he was implored to repair the Abbey of Sainte Geneviève, the patroness of Paris, Louis resolved to erect a great church dedicated to the saint. At first, there was no money available. But it was decided that every ticket taken in the lotteries should be charged four sous higher than before, and the excess was to be used as a building fund. The works were probably commenced between 1755 and 1760, for in 1763 the subterranean church, which is now the receptacle of the coffins of a few Frenchmen who are supposed to be renowned, was completed. The commission for the building was given to JACQUES JEAN SOUFFLOT, who erected several buildings for the State, the Church and municipalities, and was probably the first architect in Western Europe to describe the temples at Pæstum.

In 1764 LOUIS XV. condescended to lay the foundation-stone of one of the piers of the dome. That seems to have been considered as a special honour to SOUFFLOT, for immediately afterwards French scepticism began to raise doubts about the safety of the structure. The foundations were said to be either shifting or collapsing. Paris is supposed to present everywhere excellent foundations. But elevated positions have peculiarities. The site of the church, like that of St. Paul's, had been selected on account of its associations. But the hill of Sainte Geneviève consisted of a peculiar kind of clay

which the Romans had utilised as a material for coarse pottery. The pits were in some places 80 feet deep. SOUFFLOT had them filled up, and apparently the foundations continue to be as firm as ever. The defects ascribed to them by the architect's contemporaries were in reality caused by defective workmanship in the piers. But the building was of a kind which demanded masonry of the highest class. As if in rivalry to St. Paul's, which was commenced about eighty years before the Paris church, SOUFFLOT resolved to have a great dome, and, as is usual in such cases, he determined to excite surprise by the apparently inadequate means adopted for the support of it. As FERGUSON said:—"The mode in which four piers of the dome, with their accompanying pillars, are projected into the centre of the church is very confusing, and the glimpse caught of the adjoining apartments behind them only adds to the complexity without increasing the appearance of spaciousness. It is evident that the object of the architect in adopting this arrangement was principally to display his cleverness in construction, and to seek to astonish the spectator by one of those *tours de force* which are so common with a declining art, but which are absolutely fatal to true effect wherever introduced."

To be successful the dressing of the stones should have been perfect. But, as we have said, there were difficulties about the money, for France was becoming more and more involved in debt, and in consequence the stones were not dressed throughout and did not lie evenly. The parts near the faces were even. But the inner part was not level. And the interior of the piers was made up not only with small stones, but with occasional fragments of wood, which were employed in order to secure horizontal beds at certain distances. When the centring was removed about 1776 it was observed that pieces of stone were broken off owing to settlements. SOUFFLOT endeavoured to remedy the defect by introducing saws at the horizontal joints, in order to remove some of the material and allow the stone to lie more evenly. It was a desperate remedy, and could not be considered successful. The disappointment caused much suffering to SOUFFLOT, who had anticipated the creation of the noblest building in Paris, and he died in 1780. The works were then suspended, and indeed the amount of debt incurred was large. It was, however, little compared with what was required to complete the building. According to an official estimate it would have required thirty-four years to carry out the works and nearly fifty to pay off the debt.

It is sometimes asked, "What's in a name?" but the proposal of the French Revolutionists to call the building a Panthéon, which was to express on its frieze that it was dedicated in gratitude to the great men of France, had a wonderful effect in imparting a new spirit to the work. Instead of grating the stones with saws, it was resolved to remove every one which appeared dangerous. That was no easy work, for in one pier there were nearly 400 cracks, sixty-four places where the stone was crushed, fifty-four openings of upright joints and 344 patchings. But the public had resolved that the building should serve its new purpose. It was no easy matter to discover what was to be done. First, a Commission of Architects was appointed, and they found that the weight of the dome had caused the piers to settle in one case to the extent of 5 inches. SOUFFLOT had really tried by experiment to determine the pressure on the stones, and he employed some kind of apparatus to help him. But the difference between his results and those of RONDELET was as 70 to 27, and the latter was considered too high. It may therefore be supposed that in reality SOUFFLOT's figures were about three times in excess, and it is no wonder the stone was found to be inadequate. Besides, from the defective dressing of the stone in some places, not more than a fourth part of the area sustained the pressure. The Commission of Architects hesitated about the extent of the works

demanded, and contented themselves with recommending the removal of all defective stones and the fixing of new centres to support the dome while that work was in progress.

The builder anticipated a different result. He probably expected more profitable work. He therefore appealed to the authorities to order an examination of the building by some of the officers of the Ponts et Chaussées. The new Commission considered the centring would be expensive and without any advantage; that the piers were less defective than had been asserted, and they decided that the strength of the building would be secured if a series of flying buttresses were constructed. Another Commission was appointed of the architects and inspectors as before, with some mathematicians. Their advice was not approved. Other Commissions followed, and eventually the building was entrusted to RONDELET by NAPOLEON, with instructions that it was to be prepared for a church under the original dedication. The building has been since that time alternately secularised and devoted to public worship.

Under the circumstances which we have narrated it was impossible for the structure to be sound throughout. It may be said that much of the strength is only skin-deep. Owing to want of funds all that RONDELET and the restorers could do was to hide the defects in the piers and other parts. To that extent they have succeeded. But however imperfect, no Frenchman would be afraid of forming part of an assemblage that would fill the area. With such an example of foreign encouragement only nervous people could suppose that a building like St. Paul's, which is no mere *tour de force*, is not able to endure, although occasional slight settlements can be discerned in the masonry.

EDINBURGH PUBLIC MONUMENTS.

SOME time ago the Town Council of Edinburgh decided to overhaul the public statues and monuments which the enthusiastic hero-worshippers of last century raised and presented to the community. This duty towards the public monuments does not appear to have been formerly fulfilled with any very zealous degree of care. Indeed, these works of art in sculpture and architecture have been for the most part left severely alone, with, in some cases, lamentable results, as was disclosed by an expert examination of the monuments. The Town Council appointed Mr. Pittendreich Macgillivray, R.S.A., to examine and report on the state of four of the statues—those of Sir Walter Scott and Allan Ramsay (in marble), and of George IV. and William Pitt (in bronze).

Mr. Macgillivray's report, says the *Scotsman*, was clear and practical. It made drastic recommendations as to what should be done to put the four statues in order, and gave a detailed statement of the methods to be employed in cleaning, restoring and preserving. The report also advised that Mr. Joseph Hayes, architectural sculptor, Dean Studio, Edinburgh, be employed to carry out the work. The committee lost no time in giving full effect to Mr. Macgillivray's recommendations, and they secured the services of Mr. Hayes, who at once began operations on two of the selected statues—George IV. and Allan Ramsay. By approved methods and energetic action he has in a remarkably short time brought these statues and their pedestals back to a more presentable condition. The bronze of the George IV. statue has been carefully freed from its dull, black impaste of soot and dirt. It shows now the surface of its natural patina, with a certain amount of metallic glint, which gives vivacity to the heavy folds of Chantrey's semi-classic manner. The massive granite pedestal of the statue has been chiselled back to its original greyness. Many will no doubt be surprised when they contrast the renovated Ramsay statue with what they remember of the dull grey, weather-beaten appearance which the statue presented about three weeks ago. This statue had come to look as if it were executed in grey stone instead of marble; it will now be seen in its pure whiteness, with an effect such as it might have had on the day of its unveiling forty years ago.

It is expected that the Town Council will continue the work that has been thus effectively begun, until all the monuments are put in order; and the suggestion has been offered that some arrangements should be made whereby these works of art would be placed under the supervision

of a competent authority, and no longer left as an omisable detail in the routine of some busy public office. It is said that there is a serious condition of affairs to be faced in connection with the monuments on the Calton Hill. That charming bit of architecture, the Dugald Stewart Monument, is specially known to be in need of skilled attention, if it is not already in some parts beyond redemption. The magnificent columns of the National Monument, which have long been regarded as fixed as the hill, are also said to betray some defects to the expert eye. Open joints and the percolation of rain-water into vital parts are believed to be the cause of the mischief.

ENGLISH AND FRENCH ARCHITECTURE.

A LECTURE was given on Friday last by Mr. W. H. Bidlake before the members of the Birmingham Architectural Association, at which he pointed out that Englishmen and Frenchmen had carried out their antagonism so far as to dispute each other's claim as to the origin of Gothic architecture, but in these days of the *entente cordiale* we were willing to make mutual concessions. While the French allowed that the high vaults like those of Durham and the English Decorated style were the precursor of the French Flamboyant, we, on our part, allowed the great French cathedrals to be the most perfect expression of Gothic art. The much greater loftiness of the French buildings entailed the scaffolding of flying buttresses to resist the thrust of the vaults and the suppression of the central tower; whilst great external magnificence was thus attained the English had as compensation a grander external effect in the triple towers of such cathedrals as Lincoln and Durham and the crowning steeple of Salisbury. Owing to the lower elevation of the English vaults, bringing it more within the range of the eye, the English architect was induced to elaborate the groining, and from this had resulted the magnificent vaults of Exeter and King's College Chapel. Mr. Bidlake then compared the simple square ending of the English choir with its large window with the complex system of radiating chapels of the typical French choir, and concluded by a series of illustrations of the west fronts of the great French cathedrals with their marked triple portals. He allowed that while we in England had no triple doors to compare with France we had at least in Peterborough a façade which might console us for their absence. The lecture was illustrated by a series of lantern slides.

ARCHITECTURE AND ARCHÆOLOGY IN LIVERPOOL.

THE annual meeting of the Liverpool University Court was held on Friday last at the town hall. Sir Edward Lawrence presided. In the report it was stated that amended ordinances were submitted relating to degrees in architecture and diplomas in special branches of medical science, embodying and extending principles upon which the University has already acted. In the former case the University was endeavouring to supply a scientific foundation for technical training, and to do for students who sought to qualify themselves for the profession of architecture what it was doing already for students who intended to enter the professions of law, medicine or engineering. It did not seek to go beyond the limits of its true functions, or to teach in the lecture-room the methods and details that belonged to the office. It proposed to deal only with the historical development and progress of the art, and with the scientific laws by which practical processes must be determined. It was not their first experiment of the kind, but the earlier regulations—tentative in character, and the result of compromise—had failed to serve the purpose for which they were designed. In framing that amended scheme they had been able to secure the advice and the concurrence of the Architectural Society of Liverpool and the Board of Architectural Education in London, so that they might reasonably hope that the new regulations would prove more successful than the old. A professorship of classical archæology had been established for three years with the aid of a guarantee fund contributed by Mrs. George Holt, Miss Holt, Mr. A. Booth and Mr. Charles W. Jones. By the election of Mr. R. C. Bosanquet, formerly the director of the British School at Athens, Liverpool had secured a scholar exceptionally qualified to develop fresh interest in the study of ancient literature by associating it with a more intimate study of ancient life.

Mr. John Rankin, by adding to the original endowment of the Lectureship in the Methods and Practice of Archæology, founded by him rather more than a year ago, had now converted the Lectureship into a Chair, and at the same time Sir John Brunner had endowed a Professorship of Egyptology. Those three Chairs placed the department of archæology in an exceptionally strong position. To those who had combined to equip the University for that special service on a scale without parallel in other British universities the Council expressed their sincere gratitude. Special importance attached to the proposed ordinance relating to degrees in architecture. The University of Liverpool was, so far as he knew, the first British university to include architecture in its course for the B.A. degree. Though that experiment had by no means failed, it had not been as successful as they could have wished. They were now trying an experiment—the first of its kind in any British university—of establishing a separate and special degree for students in architecture. The arrangement would probably enable them, in conferring degrees, to take into consideration not only the work that was done in the lecture-room, but the work that was done when the student passed into the architect's office. Having had the honour of attending conferences in London on the subject, he could testify to the great help and sympathy which they had received from the representatives of the Royal Institute of British Architects and of the Liverpool Architectural Society.

HERALDRY IN RELATION TO THE APPLIED ARTS.*

THE heraldic group of armorials is called an achievement, hence hatchment, the lozenge-shaped panel that is sometimes placed on the front of a house of mourning. An achievement consists principally of shield and crest, with the helmet and mantling, but, in addition, mottoes, coronets, supporters and other accessories may form part of it. The proportion of its parts varies very considerably. During the Middle Ages it was something like two-fifths of the whole height for the shield, and three-fifths for the helm and crest, but these proportions were much modified by circumstances. In some cases, as in the monument to Lord Bouchier in Westminster Abbey, the shield was very small indeed, because the arms were adequately displayed elsewhere on the monument, while the crest was not. The armorial group on the keystone of the arch of Henry V.'s Chantry, also in Westminster Abbey, is similar in this respect. The general proportion that I have indicated is a very satisfactory one, however, which brings the helm a little above the centre of the composition, in which it serves as a point on which the other objects group themselves. This proportion also affords scope for clear definition of both arms and crest, and has a satisfactory and dignified appearance. The whole design of an achievement should, of course, be directed to the most distinctive display of all the armorials, and their relative importance will in some measure dictate the proportion. Thus if a shield be quarterly, or otherwise complicated, it may be enlarged and will still look right because the reason explains itself.

Whatever the style of the design, it should express its subject in the most explicit way, not allowing scrolls to outshine the crest nor badly composed mantling distract attention from the arms.

The general method of grouping armorials may have been suggested by their actual relative position (as may be seen in the equestrian seals), as well as by the custom of carrying armorial insignia in procession, when they were borne suspended from staves, or in stationary ceremonials were hung from stakes or small trees.

There is nothing of special heraldic significance in any particular grouping of the shield with other objects, and the shield and the crest may be placed side by side or in any other way that suits the general design. Shields and crested helms may alternate in a frieze or a string-course, for example, and in such a case the mantling may be found useful as running ornament with which to tie up the whole design. And similarly, in circumstances which make undesirable the piling up of the components of an achievement, they may be placed side by side with complete propriety.

The principle of concentration on the most significant part of the heraldry is nowhere more habitually violated than in the treatment of supporters, for they are often

* From the Cantor lecture, by George W. Eve, published with illustrations in the *Journal of the Society of Arts*.

designed with little regard for the armorials that they support. Their privileged character, as accessories to the arms of peers and of other persons of exceptional distinction, has resulted in their treatment in a way that is by no means in accord with their relative importance. Originally derived from badges, their evolution from that state to their present condition is well illustrated in the seals, which it soon became customary to ornament by filling with decoration the spaces between the triangular shield and the surrounding circle. And this was done in various ways—at first with scroll ornament, then with badges which, from being small and as it were accidental devices, increased in regularity and importance until they acquired a recognised status as supporters, and in later times have been allowed to dominate the whole group, which development has been assisted by the natural readiness of sculptors and others to make the most of an inviting subject, but the result has been to belittle the more important shield. It is very necessary to bear in mind that the perfect legibility of the arms on the shield is the essential point, and that the whole achievement should be designed accordingly.

Supporters still retain a greater amount of freedom than other heraldic objects in regard to pose, which in their case is by no means so rigidly prescribed. Thus, although an animal is usually in a rampant position, it is not necessarily so, and is not so described in the blazon. A lion, for instance, is not blazoned a lion rampant or otherwise, but simply a lion; so that if the occupied space renders another pose desirable it may be adopted, though at the same time there can be no doubt that the rampant position is best whenever possible. Thus, in horizontal positions, such as friezes, a shield may have couchant supporters, and when an animal supports a banner it may be *sejant*, that is, sitting. Again, the supporters need not be placed exactly at the sides of the shield if there is any reason, with regard to design, for another position. In the seals they often occupy spaces a little above the shield, and sometimes seem to hold up the helm and crest or the coronet. In other cases they are below the shield, really seeming to hold it up, as in the windows at Ockwells, that beautiful series of armorial glass which contains the arms of Henry VI. and of his queen Margaret of Anjou, supported by heraldic antelopes, the king's device, and by her own eagle. It will, of course, be noticed that the perpendicular form of the window space suggests this treatment. Apart from such controlling reasons, the places at the sides of the shield are without doubt most satisfactory.

Remembering that the shield is the principal point, the supporters should be composed with due regard to it, and their lines should lead into and emphasise it as the central motive. An effective amount of symmetry should also be established between the respective figures when it is possible, and the main composition lines of supporters will need special emphasis when animals have their heads turned away from the shield in the position of *guardant* (and still more so when they are *regardant*), in order to counteract the dispersing effect of those poses. Here it must be noted that freedom of pose in supporters does not extend to the head, for when a supporter is blazoned *guardant* it must be full faced, or nearly so, and when *regardant* must look backwards.

Actual physical support need not be insisted upon, so that there is still less obligation to over insist on it. As we have seen, birds as well as beasts are used as supporters, and an interesting instance of fish supporters occurs on the seal of Dauphiny, and another case is that of the city of Glasgow.

Besides the actually heraldic supporters, other figures are used in a similar way but in a purely decorative manner, such as angels and amorini. Of these there are, of course, numberless examples, among them the groups of angels which hold the shields on the spandrels of Henry V.'s Chantry in Westminster Abbey, and the demi-angels with badges arranged in Henry VII.'s Chapel and other parts of the abbey, which latter, by the way, were closely followed by Pugin in the decoration of the Houses of Parliament.

Interesting examples of angelic supporters occur in the tapestry at Hampton Court Palace. They contain the arms of Cardinal Wolsey and those of the archiepiscopal see of York impaling the insignia of an archbishop, each shield being supported by kneeling angels. The arms of the great cardinal were sometimes supported by griffins or again with amorini. A beautiful instance of the latter occurs in the panel in high relief which faces the Crown Court at Hampton Court.

A word of caution regarding such non-heraldic figures may be useful in order to avoid possible misunderstanding, namely, that their purely ornamental character should not be confused by the addition of details or drapery that might have heraldic significance, such, for example, as the angels clothed in tabards of the royal arms of France, which formerly supported the French shield.

Among other insignia that may accompany armorials, crowns and coronets are of conspicuous importance, and present excellent opportunities for decorative treatment. In their origin they were simply circlets of dignity, which, however, soon took regular form and symbolic significance.

The king's crown is composed of four crosses and an equal number of fleurs-de-lis, raised alternately on the rim, and has two arches which rise from the crosses and support at the top an orb which also terminates in a cross. These, which are the essential parts of the crown, may be treated ornamentally, with great freedom. Tudor architecture is especially rich in examples of great variety and beauty, and of these some of the best are in King's College Chapel, Cambridge, and on St. George's Chapel at Windsor. There is a series on the exterior wall of the latter chapel of which no two are alike in detail, though, of course, they are all essentially the same. However varied the treatment may otherwise be, the arches always rise from behind the crosses, never from the fleurs-de-lis in the case of the English crown, though in the Scottish one they do so in some instances.

It must be understood that the king's crown is an imperial crown, and has for centuries been so held to be, certainly since the time of Queen Elizabeth. Indeed, it is quite probable that there was some such intention when it was first enarched by Henry V. However that may be, there is no distinction in our heraldry between a royal crown and an imperial one, and when crowns occur as charges they are invariably described as "imperial crowns."

The shape of the arches has varied very much from time to time and even at the same period, for it has never been thought necessary in decorative design to follow the exact pattern of the actual crown. This has remained constant since the time of Charles II. The Tudor crowns were in general either pointed like a Gothic arch or flat at the top, as are those at Windsor and Cambridge. The latter form gives a squarish line that is suggestive of strength, but it unfortunately led in later times to a less satisfactory shape, that of the Georgian crown, in which the arches were much depressed at their intersection. The present shape, as approved for official use, is a return to the more beautiful Pointed arch.

The decoration of the arches may take many forms—large pearls, architectural crockets or oak leaves, and so forth. With regard to the treatment of the crosses on the rim and on the orb at top, there is an unfortunate tendency to spread the ends of the limbs until they almost touch at the corners, and the result is to suggest the form of a square that is perforated saltirewise with radiating vesica-shaped holes, and not that of a cross at all. The earlier more open form is much more beautiful.

As to the jewels, it is well to show them as *en cabochon*, rather than as cut into facets; and it is to be understood that their arrangement and colour is quite conventional and need follow in no way the details of the actual crown. The same remarks apply equally to the coronet of the Prince of Wales, which, however, has but one arch.

The coronets of peers, which had taken definite form for various ranks in the seventeenth century, were officially regularised by Charles II., and their various forms can be seen in any peerage.

About the caps which they enclose there is sometimes a little question, however, but there is no doubt that the coronet itself is the essential emblem of rank, and that the cap may be omitted if necessary. Indeed it was so admitted, and in official work, soon after the definite rules for the wearing of coronets were made. Of course, if one is painting a portrait of a peer in his coronation robes, his coronet will be represented with a crimson velvet cap lined and turned up with ermine, but in ornamental design it is non-essential.

It should be noted that peers' coronets must not be jewelled, and that the so-called pearls that are on those of all ranks below dukes are really silver balls and must be so represented. Jewel forms are indicated on the circlets of all above the rank of a baron in engraved or other metallic surface decoration in place of actual jewels. The rim of a baron's coronet is plain with the exception of a slight decorative line that may run round it.

I have before pointed out how boldly and decoratively crowns and coronets were treated in relation to the shield down to the sixteenth century, extending at least from side to side of it and sometimes beyond as though enclosing its top, and this point is illustrated effectively on the tomb of the Countess of Richmond, mother of Henry VII., in Westminster Abbey. Comparison is impossible between the strong dignified treatment of this beautiful monument and the small and mean way in which the thing is done in most modern work.

A series of coins and seals is very instructive in this way. Thus the golden bulla, probably designed by Holbein, with which Henry VIII. sealed the treaty of the Field of the Cloth of Gold, has the crown treated expansively in the way that I have described, from side to side of the shield. Turning from that to modern coinage, we see the crown more suggestive of the top of a pepper-box. There is improvement in this respect, but there is still evident a fear to make the crown of full decorative proportion.

Badges and devices, forms of personal allusion from which heraldry sprang and to which it has returned now and again with renewed interest, are among the objects that are most useful in heraldic decoration because of the freedom with which they can be handled. Like mottoes, they are outside the restrictions of heraldic rule, and may be invented and applied or disused with perfect facility. Historic badges without number are to be seen in architectural decoration where they usually occur with splendid effect. Many badges allude to events, as does the sword chape of Lord Delawarr, whose ancestor took prisoner the French king, or the purses which commemorate the Lord Treasurership of Lord Cromwell on the mantelpieces of Tattershall Castle; but the majority, especially such as were devised in large numbers in the fifteenth century, are full of a more purely symbolic meaning. Thus, the porcupine of Louis XII. was an emblem of offence as well as defence, however, for it was believed to be able to shoot its quills, and so attack at a distance. The lithe little ermine of Anne of Brittany was emblematic of unsullied purity, as well as allusive to the conventional ermine shield that was her coat of arms. A beautiful representation of a badge of clasped hands is sculptured on a marble frieze that is attributed to Matteo Civitali, of Lucca, in the fifteenth century, and is shown in the slide.

At Westminster Abbey may be seen the splendid bronze gates, with the badges of Henry VII. and his queen, Elizabeth, and of his mother, Margaret, Countess of Richmond, which close his mortuary chapel.

The royal badges of the present time are regulated by warrant, among them the rose, thistle and shamrock, both singly and joined together on one stem in the Union badge; also the red dragon and the harp.

The distinctive ostrich feather plume badge of the Prince of Wales consists, I need hardly say, of three feathers ensigned with the Prince's coronet, of necessity without the arch, and having below two scrolls of garter blue bearing the motto, "Ich Dien," in gold letters. These are the heraldic facts, but the artistic interpretation may vary very much; whether the badge be treated in the early and more severe style, or in the freer curves of Renaissance work, it is always a very decorative and interesting object. Its origin is obscure, but a feather was a favourite royal badge from early times, and its symbolism is said to be that of steadfastness; for, however bent it may be, it returns to its original form. Edward the Black Prince directed that his ostrich-feather badge should attend his funeral, and so it appears on his tomb. At this time the badge was a single feather with its quill enfiled with, that is to say piercing, a scroll. In this form it is thrice repeated, two and one, on the shields which alternate with the Prince's regular armorials. He described the shield bearing the three (separate) feathers as his "Arms for Peace," and that indeed seems to be the character of most badges (though there were others), and it is a character that is very much in harmony with modern feeling, and therefore very appropriate to a motive for present decorative use. The Prince's badge in its present form was not used until the middle of the sixteenth century, and since then has remained unchanged. Its free spreading treatment was perhaps suggested, at a time when Italian influence was strong, by the Medici badge of three feathers interlacing the familiar gem ring of that family's device.

The more recent and approved fashion is to draw the feathers stiffly upright, after the manner of the single feathers of Mediaeval times; but though the treatment is, perhaps, preferable to that of the Renaissance in some

respects, it has hardly the full convincing rightness of Mediaeval style. One feels that if it had been done in the fourteenth century, the symbolism would have been expressed in a somewhat freer manner and still without loss of strength.

Quite recently a more distinctively Welsh badge, the red dragon of Cadwallader, of King Arthur and of Henry VII., has been assigned to the Prince of Wales in addition to the feather badge. This, being also one of the King's badges, is differenced for the Prince, with a label of three points, as are His Royal Highness's other armorials.

As I explained when dealing with crests, badges may be made out of the details of a coat of arms, or the crest itself may be used as a badge by the omission of the helm and torse, where, for any reason, it is not desired to use the actual armorials; or the badges may even be used in conjunction with them.

Insignia of knighthood, the badges and collars of the various orders, are other objects of significant importance that present ample opportunities for artistic treatment. The execution of the actual things in goldsmith's work and enamel would afford especially interesting occasion for applying taste and skill to objects that have become commonplace by careless repetition.

It will be understood that, like other heraldic insignia, those of orders must be accurately rendered with regard to the character and sequence of their components, but at the same time there is no obligation to follow a particular style.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third general meeting (business) of the Session 1906-7 was held on Monday, December 3, when the chair was taken at 8 o'clock P.M. precisely, for the following purposes:—

The CHAIRMAN brought the following proposal before the meeting:—

By-law 3, as amended at the general meeting of June 6, 1904, not having yet received the sanction of the Privy Council, the old form of by-law is still in operation. The Council suggest, however, that, pending the settlement of the larger questions involved in the revision of the Charter and By-laws (suggested by the registration committee and adopted in principle by the general body, but referred to the Council for a report), they continue to act under the old by-law until such time as all the changes may be made together, the Council undertaking in the meantime to act in accordance with the spirit of the proposed by-law until it comes regularly into force. A number of nominations to the Fellowship have, however, lately been made from the Colonies and elsewhere, some of which had to be referred back for further information. The Council propose to deal with these, in common fairness to the candidates, on the old lines.

Resolved, that the date December 31, 1906, in the resolution of February 29, 1904, be extended to December 31, 1907.

Mr. LACY W. RIDGE moved the following resolution, and it was resolved, "That the Royal Institute of British Architects is of opinion that the provisions of 'The Public Health Acts (Building By-laws) Bill 1906,' which has already passed the House of Lords and is now sent to the House of Commons, will, when enacted, prove advantageous in facilitating building operations in rural districts."

Resolved, "That the Royal Institute of British Architects considers it inadvisable in the interests of architecture that public officials should act as architects for public buildings unless they have had an architectural training."

A Meeting of the Executive Council of the proposed Scottish National Exhibition in Edinburgh in 1908 was held last week. It was reported that a very encouraging response had been made to the recent appeal for subscriptions to the guarantee fund, and that the fund now amounted to upwards of 23,000*l*. A preliminary building and construction committee was appointed with instructions to prepare the necessary conditions to be observed by architects in submitting competitive plans for the exhibition. A preliminary advertising committee was also appointed, and was authorised to prepare the conditions for competitive designs of a poster for the exhibition.

NOTES AND COMMENTS.

ON Monday last a deputation from the Royal Institute of Architects of Ireland interviewed the Lord Mayor and Corporation of Dublin respecting the preparation of plans for the new technical school. Mr. MITCHELL, R.H.A., the president, said it had been resolved to have the plans prepared by Mr. M'CARTHY, the city architect. They made no objection to him, but on public grounds they considered the new school should be worthy of Dublin, and that no effort should be spared to secure the highest Irish talent in designing it. It had been stated that by the employment of an outside architect fees would have to be paid which might be spared. But if a superior design could be obtained by competition or otherwise the Corporation were morally bound to adopt it. Besides, the city architect was too engrossed with his official duties to think out a design involving so many problems. Dublin would have presented a different appearance if private architects were neglected in obtaining designs. Finally, the architects paid rates and taxes, and it was not right to deprive them of their means of livelihood. Sir THOMAS DREW acknowledged that during the past forty years the Corporation had done much towards beautifying Dublin, and expressed the hope that a generous view would be taken of the request. The Lord Mayor promised that the views of the deputation would be carefully considered. In Dublin unfortunately there is a very strong spirit of centralisation, for the Corporation wish to be masters in practice as well as in theory. It is doubtful whether any prominent member of the Irish Institute is a Nationalist or is able to discourse in the Irish language. These last qualifications seem indispensable for all officers, high or low. It is also doubtful whether any outside architect would gain much by the commission, for we believe the site has not yet been fully defined.

It is remarkable in Paris that in spite of all the power of the Government and the ease with which buildings were appropriated under various reigns there is still insufficient accommodation for some of the Ministers and their officials. The Louvre is imperilled because the authorities responsible for works of art cannot evict departments which might be as well housed in a remote part of the city. The venerable Archbishop of Paris is about to be turned adrift because the episcopal palace is wanted for the Ministry of Labour. When a few years ago it was announced that the National Printing Office was to be removed from the buildings in the Rue Vieille du Temple, it was anticipated that the opportunity would be taken to effect a great improvement in a part of Paris which requires to be aerified. But already the Director of the National Archives demands the premises in order that he may fill them with the countless documents at present heaped in wooden structures which can be easily destroyed.

THE Portrane Lunatic Asylum, in the county Dublin, seems to be one of those buildings which possess qualities irresistibly fascinating to litigants. Although a new building it has acquired already a legal history, and apart from the proceedings in the courts there has been a long arbitration before Sir T. DREW, P.R.H.A. On Monday an effort was made by the contractors to reopen the case by an application for documents. The reasons given were somewhat unusual. The original contract amount was accepted as 167,000/. This was, however, a "mutual mistake," for the amount should have been given as 167,830/. It was stated that the authorities of the asylum admitted that work was done on the larger amount, but that legally they were not bound to pay the balance. As the demand had not been claimed within six months the amount could not be recovered under the Local Government Act. They also alleged that the contractors had committed an error to the extent of 400/., and that one should act as a set-off against the other. The Master of the Rolls declined

to reopen any question about the larger amount, but advised that counsel should agree about the documents required in the 400/. error and to make an application respecting them. It is not often such a comedy of errors comes before a court in respect of building.

FOR anyone who can enjoy rows of figures the "Statistics of Public Education in England and Wales" will have attraction. Owing to difficulties in obtaining returns an additional period has had to be included, and the volume consequently refers to 1904-5-6. It appears that on January 1, 1906, there were 20,883 recognised schools with accommodation for 7,042,966. About two-thirds of the schools, or 13,837, were "voluntary." The technical institutions to which grants were paid number only 23, and are attended by 2,509 students. Grants amounting to 8,542/. were paid in respect of students attending a full course of instruction, and 1,507/. for those attending a partial course. In architecture and building 48 students attended a full course and 20 a partial course. In engineering the respective numbers were 539 and 174. There were at the beginning of the year 231 recognised schools of art and 45,562 students. The amount paid by the State was 55,008/. The total expenditure of the Board of Education out of the Parliamentary vote has amounted for the year to 12,611,349/. Out of that sum the Royal College of Science received 21,798/., the Royal College of Art 11,884/., and the Geological Museum and Survey 20,592/.

STABLING AT LINGFIELD.

RANDALL'S FARM COTTAGES, LEATHERHEAD, SURREY.

THESE three cottages are built of local red bricks and rough-cast and roofed with Brosley tiles. The builders were Messrs. G. & W. BROWN, of Leatherhead. The architect was Mr. H. D. SEARLES-WOOD, F.R.I.B.A.

DESIGN FOR HOUSE.

THIS house was built at Benhilton, Surrey, for Mr. W. K. APPLETON. The builders were Messrs. R. JONES & SON, of Sutton, Surrey. The architect was Mr. H. D. SEARLES-WOOD, F.R.I.B.A.

BAPTIST CHURCH, SHOOTER'S HILL ROAD, BLACKHEATH.

TOTTENHAM TOWN HALL, FIRST-FLOOR LANDING.

BUSINESS PREMISES, 363 OXFORD STREET, W.

THIS building, just recently completed on the site of the Horse and Groom public-house, has been let by Messrs. MAY & ROWDEN to the International Aspirator Company. The front is of Portland stone, and all the floors are constructed to let for business purposes, with a hydraulic passenger-lift by Messrs. MEDWAY & SON, of Rolt Street, Deptford. The carving to the front was executed by Mr. HEARN, of Little East Place, Kennington Road, and the works generally were carried out by Messrs. H. & E. LEA, of 3 and 4 Warwick Street, W., under the guidance of the architect, Mr. E. KEYNES PURCHASE, 20 and 22 Maddox Street, W.

BUSINESS PREMISES, 66 CONDUIT STREET, W.

THIS building has just been completed by Messrs. PATMAN & FOTHERINGHAM for the London and County Properties, Ltd., from the designs and under the supervision of Mr. E. KEYNES PURCHASE, 20 and 22 Maddox Street, W. The front is of Portland stone, and the carving to same has been carried out by Mr. HEARN, of Little East Place, Kennington Road. The premises, which run back to New Burlington Place and have a back entrance therefrom, have just been let by Messrs. MAY & ROWDEN to Messrs. MILLER & SONS, of 178 Piccadilly, W., who are now going into occupation.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at Tufton Street, Westminster, Mr. Walter Cave, vice-president, in the chair.

The CHAIRMAN expressed the regret of the President, who, through illness and a serious operation, was unable to attend to his duties and be present at the meeting.

Messrs. E. P. Jay, J. M. Kendall, J. A. Slater, M. S. Adams, R. A. Holland, H. A. Gold, A. J. Manton, H. Brine and R. Lowry were elected members.

The CHAIRMAN reported the "Thomas Garner" bequest, which consisted of more than 200 books.

Mr. E. PRIOLEAU WARREN explained how the bequest came about. Mr. Garner, before his death, wished to consult the speaker, who had been a pupil, as to the disposal of his books, but owing to many postponements through illness Mr. Garner's wish was never fulfilled. The widow, however, knowing it was the intention of Mr. Garner to give to his former pupils and friends certain books, asked Mr. Warren to undertake the task of allotting them. After this Mrs. Garner wished that the main body of the collection should be kept together, and form a library for students of architecture. The speaker said he told her of the Association, and on hearing that it existed mainly for the benefit of the young architect Mrs. Garner readily consented to his recommendation and placed the admirable collection in their hands. Mr. Garner, continued the speaker, was very little known, because he was a shy and retiring man. He was in partnership with Mr. Bodley, but left everything in the latter's hands. The rapidity with which he worked was astonishing, and there was always a strong individuality in his designs. Mr. Garner set an extreme store on precedent, certainly more than most of his contemporaries, but he was not a copyist. In his partnership with Mr. Bodley the deceased was almost solely responsible for the civil and domestic work done by the firm. In conclusion the speaker said he felt sure that all who made use of the books would feel under a debt of gratitude to Mr. Garner and his widow.

Presentation to Mr. W. G. B. Lewis.

The CHAIRMAN said his next duty was an extremely pleasant one, which had been foreshadowed in their last meeting. They all knew Mr. Lewis and the work he had done for the Association in the past. He was elected to the A.A. in 1874, and had been one of its most indefatigable workers during the last fourteen years. The Chairman then presented Mr. Lewis with a cheque for 50*l.* and a copy of "Renaissance Architecture in England." The inscription in the first volume of the work reads:—"Presented to William George Blackmore Lewis by friends and fellow members of the Architectural Association, together with a cheque for 50*l.*, as a token of esteem and appreciation of his work done in the interests of the Association, especially in connection with the studio during the last fourteen years."

Messrs. W. MILLARD and F. G. FELLOWES PRYNNE spoke in high appreciation of Mr. Lewis's ability as a teacher and the work he had done for the Association.

Mr. LEWIS said he scarcely knew how to return thanks for the kindness shown to him in their testimonial. In his work for the Association he had always endeavoured to do his best, and it was by this spirit which others had also shown that the Association had been enabled to accomplish so much without greater financial assistance.

Mr. W. WOODWARD read the following paper, entitled

The Difficulties which beset an Architect in London, with Special Regard to Existing Legislation and other Controlling Authorities.

I suppose as one gets older one chafes at what one conceives to be unnecessary control. Nobody in this room would attempt to deny that there is much virtue in fresh eyes and in fresh minds being fixed upon our work, as the benefit of fresh experiences is brought to bear upon the subject which may be under discussion. It is equally certain that, if each architect or building owner in London were permitted to exercise his own uncontrolled free-will, London would assume a picturesqueness, to say the least, which would be instructive if not satisfactory, and, in considering this question of control, I intend to devote myself not so much to the non-necessity of such control as to the manner in which it is administered.

Any individual who is able to look back, say, for forty years, must be startled at the difference between the way in which building works were permitted to be carried on then, and the way in which they are permitted to be carried on

now. Not only in strictly building works, but in the more general municipal operations in London, a grandmotherly legislation has sprung up and is increasing every day, with the apparent object of stifling all individuality and bringing everybody within a code of Acts of Parliament, rules, regulations and by-laws, most of them the result of officialism and red tape, and many of them the result of that inadequate knowledge which begets nervousness and want of self-reliance.

The architect who has to erect a building in London is pulled up at every stage of his operations by the London County Council, borough councils, medical officers of health, sanitary inspectors, district surveyors, surveyors to freeholders, litigants in "light" cases, party-wall awards, and sometimes, to add to his miseries, an interfering and objectionable client.

One interesting feature of these various items of control is, to my mind, this—that so many of these bodies, in staying the hand of the architect, take upon themselves, sometimes quite unwittingly, responsibilities in case of accident or failure which they need not at all take; in other words, they wander outside their provinces in dealing with detailed matters of construction, &c., which might, and should, be left entirely to the personal responsibility of the architect.

For example, the London County Council forgets, say, in the case of covered ways and projecting iron and glass shelters, &c., that its duty is merely a question of projection beyond the line of frontage, and having found that there is no objection to such covered ways, they might well leave the construction of the work and the safe erection of it to the architect and building owner; but, instead of that, they employ a staff of gentlemen to examine into every minute detail of construction, and thereby, of course, in the case of any failure, they would be held responsible for the results. All this, of course, in addition, entails heavy expenditure on the part of the ratepayers, who have to meet the large establishment charges of the London County Council.

The borough councils are far too particular in many cases as regards the works which come under their control, and we all know that at times we have to meet the fads and fancies—and they are really nothing more nor less—of medical officers of health and sanitary inspectors. Recently, too, an enormous amount of unnecessary work is placed upon the architect's shoulders in preparing plans and sections of water-closets, &c., which a practical-minded surveyor could settle in five minutes without any such drawings.

A word as to district surveyors. Every architect in practice has to meet district surveyors in different districts, and he becomes sometimes painfully aware of the different way in which the provisions of the Building Act are administered by different district surveyors. In some cases the whole intention of the Building Act is maintained, and the public interest looked after without causing any friction with the architect. But in other cases a policy of pin-pricks and unnecessary interferences are carried on by straining to its utmost extent every section in the Building Act of 1849, and where one section does not apparently give sufficient elasticity for worrying the architect and the builder, the district surveyor will sift out some other clause which will better enable him to pursue his worrying tactics.

Surveyors to freeholders, again, take upon themselves responsibilities for construction, &c., which they are not bound in any way to assume. As a rule the building leases are granted for eighty or ninety years, and the reversion to the freeholder does not occur till the end of these periods, and, if a building is erected in a thoroughly substantial manner, with due regard to appropriate architecture, the surveyor to a freeholder ought to be satisfied, and not worry himself and drive the architect to desperation by interferences in minor and trifling matters of detail, which in no way concerns the reversion at the end of eighty years. Here, again, such surveyors accept, in consequence of their interferences, heavy responsibilities in the case of failure, which they need not have accepted.

It may be quite true that, according to the building agreement, the building has to be erected in accordance with drawings to be approved by the freeholders, but that approval only means a general approval, and should not be construed to mean that every minute part of the structure is to be the object of concern and alteration on the part of the freeholders. This is clear by the manner in which drawings are approved by the various surveyors to London freeholders.

Now let us assume that, after many months of patient endeavours on the part of the architect, the production of dozens of unnecessary drawings and the consumption of an enormous amount of unnecessary time with all these various bodies in simply obtaining official sanction to what is proposed, the building starts, and almost before the demolition of the old premises is completed, down come a little army of adjoining owners with purely imaginary grievances as regards interference with "light," and, after obtaining injunctions, which stop all building works, the case is fought out in the Law Courts, with two or three eminent surveyors on one side who swear that if the building goes up as designed the owner of the dominant tenement may as well go and drown himself at once, as he can only die a lingering death in consequence of being closed in in tomb-like fashion, deprived of every particle of "light" and every particle of air that is so necessary to sustain life in London; and, on the other side, three equally eminent surveyors will swear that the erection of the new building will not only not interfere with the "light" hitherto enjoyed by the dominant owner, but his "light" will be very materially improved by the erection of a building double the height of the old building pulled down.

We all know the building has not gone so far without being the subject of sometimes several party-wall awards; and in the communications between architect and architect as regards these party-wall awards, considerable experience is gained as to the real knowledge of architects, and their propensities to adopt the methods of the lawyer in arriving at a conclusion on very simple practical matters; and the architect to the building owner also discovers how varied the ideas of the architect to the adjoining owner are in the matter of fees. I have myself had instances where, with precisely the same award, which I have myself drafted, and with precisely the same work on the part of the adjoining owner's surveyors, in connection with the same building the fees have ranged from two guineas to twenty-five guineas; and may I make an observation upon the additional unnecessary trouble and expense incurred in stamping the awards and counterparts? Personally, I never require this stamping to be done. It is true it only costs 2s., but it is the unnecessary trouble and time which it involves of which I complain. I have been advised that, inasmuch as any dispute as regards the awards is referable to the third surveyor named therein, it would not be necessary to produce the document in a court of law in the first instance, because if a dispute arose upon the award of the third surveyor, that document would be stamped, and could be produced in court when an attempt was made to upset it.

Then comes the interfering and objectionable client, whose doings can, of course, be put down to entire ignorance of building matters; but they are none the less vexatious and in most cases unnecessary.

What should be the limits of legislation are well defined, I think, by Humboldt, who says that "the law should prevent one man from wronging another, and should protect the rights and liberties of all." If the law attempts to do more or less than this, we are told it will be liable to be harmful rather than useful. Whether this limitation is correctly defined or not, it would appear to be applicable for the guidance of those who wish to make building laws and regulations workable and useful, but we all know that frequently Humboldt's dictum is ignored altogether by many of our controlling authorities.

You will now expect me to make some practical suggestions for improving the present state of things; and I would suggest the following, leaving my hearers to fill in the voids.

Let us take the London County Council. I would suggest that the Building Act committee be put an end to, or reduced to, say, four members, these members being selected specially for their knowledge of building operations, and for their non-political tendencies. In the case of the new Building Act (Amendment) Act, as regards risks from fire, there can be no doubt whatever that the London County Council are unnecessarily worrying, simply because an unfortunate fire occurred in Queen Victoria Street, which entailed a loss of life, for which the London Fire Brigade were not wholly irresponsible. The London County Council requirements, in the shape of lobbies, ventilating trunks and other absolutely unnecessary and untried ideas, are the source of a large expenditure of money and serious interference with the building, and I feel quite sure that, if the architects were left to themselves to provide reasonable means of escape in case of fire, far better results would be obtained.

The setting back of the building line at the rear of certain buildings, and the angle of 63½ degs. is a monstrous interference with the disposition of property. The control exercised by the London County Council over simple projections at the rear, or porticoes and covered ways in the front of buildings, should be shifted from that central body to the surveyors and councils of the respective local boroughs, who are far better able to judge of the effect of such additions than the central body, who can know very little indeed of the local requirements of such a vast area as London.

For a sample of the petty interferences of local authorities I would point to a case in Charing Cross Road, in which a bookseller was summoned before a magistrate by the Westminster County Council for projecting his book-stall some 18 inches beyond the line of frontage, while, at the same time, that same Westminster City Council permits hundreds of yards lineal of the footways of the Strand and other congested thoroughfares to be occupied for hours by intending visitors to the theatres, music halls, &c. A more glaring instance of the petty interferences of the London County Council was brought before the Lord Chief Justice and Mr. Justice Darling on the 17th of last month, where the Palace Theatre Company had been summoned in consequence of an advertisement in front of the theatre, which had been certified to be in some parts 14 inches and 16 inches, and in others 22 inches in front of the building line. Many of us have seen the very artistic advertisement referred to, and the idea of interfering with it is, as I say, monstrous. The fight in the High Court is as to whether the erection was a "structure" or not within the meaning of the Act. The case is not yet decided, so that all I can say is, for myself, that the idea of trying to convert that temporary and movable advertisement into a "structure" shows the pains the London County Council put themselves to to secure a conviction on so trifling a matter.

Take, again, their requirements as to theatres. We all agree, of course, that proper means of rapid exit should be provided in every building frequented by large numbers of the public, but the Council does not stop there. They must needs grope about in theatres to look after gas taps, opening of doors in certain directions, which would probably be more mischievous in case of fire than if they had let the old doors alone. Certain staircases, in the eyes of the Council, are safe if they have a certain tread and rise and a certain number of steps in a flight, and absolutely unsafe if half an inch or so is taken from the tread or added to the rise. But why an additional step or two should make the building unsafe only the London County Council body could say.

Then, again, the London County Council requirements in their building agreements for letting land are too much on one side. The conditions in the building agreements of the great ground-landlords of London are, Heaven knows, sufficiently stringent, but the London County Council requirements are such that every building owner, with due regard to his financial prospects, would hesitate before binding himself to such one-sided conditions. If the great ground-landlords of London get the ground rent they stand out for—and of course they do, or they will not let the property—why should they impose unreasonable conditions when, as I have said before, their reversion is eighty or ninety years hence? And in the case of failure on the part of their lessees these same ground-landlords would be only too glad to step into the shoes of their lessees and take over the building, for which they could obtain a rack rent instead of a ground rent.

Take, again, the borough councils. Simply because a man desires to make some little alteration to the drains of his dwelling-house, he has to go through the paraphernalia of submitting plans and sections, all in duplicate and at considerable cost, because the councils will not leave the matter in the hands of their surveyor, who, after looking at a rough idea of the drainage, could take his pencil and make such alterations as he might desire in ten minutes, leaving the sanitary inspector to see that the more important requirements were carried out, such as the main drain, the inspection chamber, the disconnecting trap and the ventilating pipe. But when one finds medical officers of health requiring walls to be built across areas for fear that the male occupants of water-closets on one side of that area might look at the female occupants of the water-closets on the other side of the area, I think grandmotherly legislation is going a step too far. Much of this unnecessary interference on the part of borough councils could be obviated if their works committee and public health committee were reduced to, say, four members, instead of the unwieldy

numbers in committees composed mostly of men who have not the least knowledge of what they are considering, but have the power to air their fads and fancies to their hearts' content.

As regards the district surveyors, I would frame another Building Act, limiting their jurisdiction very much indeed, and only securing that the building should have its walls and floors of a substantial character.

As regards rights of "light," I would prevent any question on that subject being brought before learned judges in the High Court who have never seen the buildings in question, and who are quite unable to understand the effect of a new building upon the "light" of the dominant owner. Such matters should be left to the decision of a tribunal of experts, similar to that which works under the Building Act of 1894.

As regards surveyors to ground landlords, I think it would do well to both sides if some case of unnecessary interference and unwarranted straining of the building agreement clauses were fought out in a court of law. We should all then know better "where we are."

I am not aware, in looking back forty years, that London was a very much worse place then, under the Metropolitan Board of Works and under the old vestries, than it is now, under the swelled body at Spring Gardens, and under the equally swelled bodies called borough councils. Regard for open spaces was secured by the then Lord Brabazon (now the Earl of Meath), the chairman of the Metropolitan Gardens Association; and although the London County Council takes credit for maintaining as open spaces what would otherwise have been built upon, much of that for which they take credit is due to the Association I have referred to; in fact I was myself, as honorary architect to that Association, the principal mover in preventing the London County Council building upon the triangular plot at the junction of Oxford Street and Bloomsbury Street; and equally in preventing the erection of a block of buildings, projected by the London County Council, right in the centre of Piccadilly Circus.

In all these matters I can, as I have said, see a growing consumption of red tape and officialism, in fact, ink and paper instead of the sound practical knowledge which existed thirty or forty years ago, and which I hope soon to see again revived; but this end will not be attained unless active opposition is made to the unnecessary interferences to which I have referred. Large building speculators are, to my knowledge, shutting up their pockets and thereby adding to the long list of unemployed in the building trade, simply because they will not submit to the delays, petty interferences and results of inadequate knowledge forced upon them by those various bodies. Surely some credit should be given to architects of repute and experience for knowing nearly as much about healthy and sound construction of a building as an assembly of greengrocers and cheesemongers, or perhaps youthful scholars who come from technical schools, armed only with superficial knowledge, without any experience in active building operations, but who are led away by the crude ideas of faddy councillors who do no good whatever to buildings in course of erection, but, on the contrary, manage to make them inconvenient inside and mutilate them outside.

It may be that there are architects who do not object to this infantile instruction on the part of these constituted authorities, and who know that the more drawings they make to satisfy the whims of such authorities the more money they get from their clients; but I thoroughly believe that the majority of architects would prefer to get on with their building without such interferences and without such opportunities of adding to their professional charges.

We know, going from London to the provinces, what wretched results have arisen from the interferences of the Local Government Board in building operations, and especially in cottages. We all remember the picturesque cottages throughout the kingdom, which have lasted for two or three centuries, which are generally composed of wood, with thin party divisions and picturesque tile roofs and half-timbered exteriors, and that they have not led to any considerable loss of life from fire, and I believe that the only few losses of life through fire in these cottages throughout the kingdom has been the result of inebriety on the part of the occupiers; the Local Government Board, however, must needs try to apply to these country cottages the impossible provisions of the London Building Act, with brick external walls, the absurd carrying up of party walls above the roof, and other perfectly ridiculous requirements which have done so much to stop the building of country cottages and the consequent loss of many a decent family, who come up to London

because their landlords cannot afford to properly house them at the rents the poor people are able to pay by reason of these unnecessary and uncalled-for requirements of the Local Government Board. I hope that this meeting will discuss the subject in a bold and fearless manner, and whether the meeting agrees with me or whether it disagrees, I can only say that I have prepared this short paper with much pleasure for the Architectural Association, and I hope that if it does no good it will do no harm.

Mr. J. DOUGLASS MATHEWS proposed a vote of thanks, and said they all no doubt agreed that there was more legislation than there was any necessity for. In former times between architects and between other professions there was more honourable understanding than there was in the present day; the simple adjustment of matters under dispute had been taken away from individuals by grandmotherly legislation, and the result was that official control was forced upon them, and certainly the life of an architect was not an enviable one. He attributed this to the way in which the Acts of Parliament and by-laws were framed. The more Acts of Parliament there were the greater seemed the difficulty in interpreting them; but, on the other hand, in dealing with the buildings of London, they could not shut their eyes to the fact that some controlling body was essential. Mr. Woodward had suggested a committee of four would be able to deal with the work undertaken by the London County Council. The speaker said he did not envy the four members of such a committee, nor did he think better administration would be the result, since it was not likely that even a small committee would always agree. The borough councils were necessarily strict in their authority, for they must remember, he said, that the borough councils were charged with certain duties, and therefore they were bound to make stringent rules as to how work was to be carried out. There was no doubt, however, that if there could be a little more common sense and a little less law it would be a good thing. Alluding to the duties of district surveyors, the speaker said in former days the appointment to such a position was looked upon as the blue riband of the profession of architecture. Many distinguished men had acted as such, but some people nowadays seemed to think the district surveyor was a kind of policeman. There was also the idea that they were the servants of the London County Council, but district surveyors were not mere inspectors, since their duty was to administer Acts of Parliament.

Mr. GEO. HUBBARD seconded the vote, of thanks, and cited some interesting cases which illustrated the unnecessary restrictions put upon architects in various sections of the London Building Act.

Mr. H. LOVEGROVE agreed with the author of the paper that the insistence upon drawings of sanitary details by borough councils might be obviated. He thought, too, more discretion might be left to surveyors.

Mr. C. H. BRODIE said he wished to say that both the last speaker and Mr. Woodward were unfair in their remarks on the borough councils. The regulations in sanitary alterations were handed over to those authorities by the London County Council, and they were compelled to see them carried out. He asked what was to be the outcome of the paper and the discussion, and whether they were going to try and remedy the hardships under which architects practised. He ventured to suggest the following resolution:—"That this meeting of the Architectural Association, having listened to a paper on the difficulties which beset an architect in London and a discussion thereon, declares its conviction that the ratepayers of the Metropolis are put to a large amount of unnecessary trouble and expense by the excessive and often absurd requirements of the various authorities having control over building and sanitary works."

Mr. W. WOODWARD seconded the resolution, which was carried *nem. con.*

Mr. B. J. DICKSEE and Mr. SAXON SNELL supported the vote of thanks to the author of the paper.

The CHAIRMAN said they had had the good fortune of hearing several district surveyors at the meeting, and it must be gratifying to the younger members to find they were not such terrible people as they were often made out to be. Tact was of the first importance when they had to do with people placed in authority, and insured a way out of many difficulties.

A Tablet is to be affixed to No. 18 Kensington Square by the London County Council, which was at one time the residence of John Stuart Mill.

ARCHITECTURAL ASSOCIATION OF IRELAND.

AT the meeting of the Architectural Association of Ireland on the 27th ult. Mr. E. St. John Lyburn, mineral expert, Department of Agriculture, delivered an address on "Irish Stone Quarries." Mr. Lyburn said he agreed with the opening address given by their president, Mr. Holloway, in impressing upon the people the importance of using Irish stone. Ireland must look to the rising generation of architects for the utilisation of her stone deposits. She was now in a better position to supply the demand owing to the amount of capital which had recently been put into the mineral development of the country. It was no longer necessary for architects to import their marbles from Aberdeen and other countries. In Galway they had now one of the most up-to-date granite works of its size in any part of the world, and were able to supply polished or rough material in any quantity. The limestone deposits were now being fully developed. The sandstone quarries of Mount Charles were being fully worked. Corporations and others wanting paving setts need not turn their attention to foreign setts, as they could be supplied by a number of quarries. As regards marbles, he had no hesitation in saying Ireland was one of the richest countries in the world. The lecturer pointed out the great opportunity which existed in this country for up-to-date cement factories. They were importing about 100,000 tons of cement annually. Attention was also called to the fact that at present no glazed bricks were made in Ireland. There was a fallacy that Irish clay would not take a glaze. The Department of Agriculture had exploded that idea.

Mr. Allberry proposed and Mr. Bradbury seconded a vote of thanks to the lecturer.

ORDNANCE SURVEYORS.

THE following official statement has been issued respecting pensions for civil assistants employed in connection with the Ordnance Survey:—The Treasury cannot, of course, admit that any of the temporary Civil assistants who have been appointed since January 4, 1873, have any right to be pensioned on retirement; but at the same time, after considering the nature of the work of the Survey, the Treasury considers that there are grounds to justify the grant of pension rights under certain conditions to a proportion of certain classes of the staff.

Of course, it will be necessary to retain a considerable number of unestablished employes.

The following are the conditions to which the Treasury are prepared to assent:—

In future every Civil assistant shall enter the service in an unestablished capacity, as at present, and shall not be eligible for the establishment until he has served for fifteen years. At the end of that period, if the Department desires to retain his services, he may be placed on the establishment, subject to his obtaining a certificate of qualification from the Civil Service Commissioners. His pay will thereafter be fixed at a rate of 5 per cent. below that which he would be receiving if he were employed in an unestablished capacity; and on his final retirement he will be pensioned on the whole of his established service and on half of his unestablished service.

It is not intended to include either the artificers, labourers or women employed on the Survey in the class to be entitled to pension.

The above provisions will be applied to members of the existing staff who are not already entitled to pension in the following manner:—

1. Those who have served less than fifteen years will continue on their present footing until they have completed that period.

2. Those who have already completed fifteen years' service may, if recommended by the director, elect to be placed on the establishment, subject to their obtaining the necessary certificate from the Civil Service Commissioners. A similar option will be offered to those who have served for less than fifteen years, on completing that period.

3. On being placed on the establishment their pay will be reduced as follows:—

Those who have served less than twenty years 5 per cent.
Those who have served twenty years and less than thirty years $7\frac{1}{2}$ per cent.

Those who have served thirty years and upwards 10 per cent.

4. On their final retirement they will be pensioned on the whole of their service from the date when they completed

fifteen years' service and on one-half of the previous service.

5. Those who are now qualified for the establishment must exercise their option before April 1 next.

6. These provisions will not apply to those officers who are already holding posts on the establishment entitling them to pensions, but on vacancies occurring in these posts they will not be filled up.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

AT the annual general meeting of the Society of Antiquaries of Scotland the secretary submitted a report on the progress and work of the Society, from which it appeared that its 127th session opened with a membership of 701.

The fortieth volume of the Proceedings, of which an advance copy was on the table, contains twenty-four papers, the most important of which is a description, very fully illustrated, of the excavation by Mr. Alexander Whitelaw, of Gartshore, F.S.A.Scot., of the Roman forts on Bar Hill, Dumbartonshire, communicated to the Society by Mr. G. Macdonald, LL.D., and Mr. Alexander Park, F.S.A.Scot., with a note on the architectural remains by Mr. T. Ross, architect, F.S.A.Scot. These excavations have brought us for the first time into certain contact with the handiwork of Agricola—have yielded, besides an abundance of the usual, and some very unusual, relics, the largest and finest collection of Roman architectural fragments hitherto found in Scotland. Special mention was also made of a paper by Mrs. Place, of Loch Dochart, describing the clearing out of the ruins of the sixteenth-century castle on the Isle of Loch Dochart. An ornament to the volume is an illustration of the beautiful bust of Paul Jones by Houdon, and equally noticeable is the fine series of illustrations to Mr. A. J. S. Brook's paper on two table clocks in the museum. The excavation of the Roman military station at Newstead, Melrose, begun in February 1905, has proceeded steadily during the year. A preliminary report of the results, which have far exceeded the most sanguine expectations, will be presented to the Society at the first meeting of the session, on December 10, by Mr. James Curle, to whose unremitting exertions the splendid success of these operations is due.

MELBOURNE TOWN HALL COMPETITIONS.

IN the latest Journal of Proceedings of the Royal Victorian Institute of Architects is the following statement:—

In connection with the competition for the extension of the Melbourne town hall it was reported that negotiations between the Institute and the town hall committee had been broken off. Originally, when the town hall committee prepared its draft conditions a copy was forwarded to the Institute. After careful consideration the Council suggested numerous amendments, all of which, with one exception, were adopted by the town hall authorities. The amendment not accepted dealt with the substitution of a board of eight, viz. five members of the City Council, the city surveyor and two members of the R.V.I.A., in place of a board of five, viz. two members of the City Council, the city surveyor and two members of the R.V.I.A. The original intention was that the board's functions should cease when it had reported that the designs submitted complied with the conditions as to size, cost and other details. The Institute maintained that if the board were enlarged both in numbers and functions the competition would result in a better class of design being submitted. The board, as suggested, was to have power to recommend designs in order of merit. The town hall committee declined to accept this suggestion, and, in order that there might be no misunderstanding, the president, vice-presidents and hon. secretary met the town hall committee and discussed the situation. The town hall committee stated that if the R.V.I.A. would accept its original proposal there would be no doubt that after the report as to compliance with the conditions had been sent in the board would be asked to further advise. The committee of the Council asked that this assurance should be stated in the conditions. But as this request was refused there was nothing left save to ask that any reference to the R.V.I.A. in the conditions of competition should be deleted. It was clearly stated to the committee that the City Council would not let the right of selection pass out of its hands. Therefore any architect competing must distinctly understand that the R.V.I.A. as a body had nothing to do with the competition.

THE VALPARAISO EARTHQUAKE.

THE following letter from Mr. George L. Duval, treasurer of the Merchants' Association, who was on his way to Chili at the time of the disaster, gives information concerning the calamity:—

The published reports and illustrations of the havoc wrought by the earthquake will give but an inadequate idea of the character and extent of the damage done. One must see it in its entirety to appreciate the devastation. The old, original part of Valparaiso was located upon solid ground on the only section of the bay partly sheltered from the violent northerly winds, which expose the shipping and water-front to great damage every winter. This section, called the Port, enlarged by reclaiming lands from the bay, is the fiscal, financial and commercial centre. The custom house, Government stores, courts, post office, city hall, the banks and large foreign houses are here located. Except in isolated instances buildings erected on natural land in the Port have escaped destruction, while those constructed on the reclaimed land are badly shattered. Thus our building on the land side of the Calle Blanco is one of the oldest in Valparaiso, reinforced by heavy Oregon-pine timber and steel beams, and remains intact, while across the street Williamson, Balfour & Co. have had to desert their office, and Duncan, Fox & Co. have replaced the front and rear walls, which fell, by temporary coverings of galvanised iron.

The damage by the earthquake throughout the zone affected has been in proportion to the character of the soil built upon and the character of construction. Immunity for many years from serious shocks developed carelessness in construction which has now paid the penalty. From the central plaza, de la Victoria, south and east, covering the entire district known as the Almendral and Bella Vista, the prospect is the most dreary imaginable. Here and there some insignificant buildings which capriciously escaped only emphasise the appearance of desolation. In this district fire finished whatever the earthquake spared. It spread over fully one-quarter of the area and it is impossible to estimate the relative damage.

The bay front of the Almendral and Bella Vista district and extending back for an average of a quarter of a mile to the Calle Victoria, the central thoroughfare, gave its modern character to Valparaiso. Here entire blocks of solid three and four storey stone structures had been erected in the past twelve or fifteen years, all of which have been totally destroyed. From the Calle Victoria back to the hills, an average width of a quarter of a mile, was the populated part of the city on the plane where the poorer classes were crowded in. This became the scene of the greatest distress. The former inhabitants have appropriated every available open space on which, with the assistance of the authorities and relief committees, shacks of wood and galvanised iron have been erected and are the homes to-day of about 50,000 people, a good proportion of whom are accustomed to genteel and even luxurious surroundings.

It is not the poorer classes who have suffered most from the disaster, as they, being provided with shelter, food and clothing for the time being, are in little worse condition than they were before, and have, besides, the certainty of plenty of work at good wages. The great burden really falls upon the middle class, on a vast number of clerks and employés whose savings were invested in their homes, which are now destroyed, and on the shopkeepers who lost everything.

The hill residential section, where the more opulent foreign colony dwells, was not badly damaged, although many families lost their homes and are now doubled up with their neighbours. The neighbouring cemetery hill seems to have been a focus of the shock. No tomb or monument escaped serious injury; most of them are wrecked, and the niches employed by families having no plot of their own, situated on the brow of the hill, were undermined, and with their contents fell to the plain.

The earthquake clause in the insurance policies almost certainly exempts the companies from claim for damage by fire which immediately followed the earthquake. The companies, however, make the formal announcement that they will not respond for any claims whatever, holding that all the fires were caused by the earthquake. It is expected, nevertheless, that they will be obliged to differentiate and pay at least a portion of the loss by fire which occurred several days after the earthquake and after the original fires were under control. These later fires are variously ascribed to short circuits on resuming electric service, smouldering cinders and to incendiaries; but, whatever the

cause may be, the companies will doubtless find that the payment of these losses is a good basis of compromise and the best means of demonstrating the value of insurance to many who are rendered sceptical by the general repudiation as announced.

The Welicias section, in the south-east extremity of the plain, was badly shattered and shows enormous damage by earthquake only. The more southern extension, at the Baron section, shows scarcely a sign of commotion, and thence for a stretch of three or four miles there is little evidence of disturbance until reaching the suburban sections of Miramar (slightly affected), Vina del Mar (seven miles from the port, badly shaken), Poblacion Vergara, Chorillos and Miraflores, a succession of ruins leaving hundreds of families homeless.

In San Francisco the damage by earthquake and by fire was estimated at 1 to 9 respectively. Here I should say the reverse will hold. The fire department is voluntary but efficient, and but for the breaking of the water-mains, would undoubtedly have checked the flames. The new water system of Valparaiso is highly efficient, but the mains could not withstand such a rude shaking. They were set right, however, in forty-eight hours and in complete working order four days after the catastrophe, which is a very creditable showing.

The wonderful work done by Captain Luis Gomez Carreno of the Chilean navy, who was vested with supreme command under martial law, in maintaining order and establishing sanitary conditions, has drawn unstinted praise from all classes. The emergency developed the man. Captain Carreno has been ordered away to recuperate his health after the severe strain of the last six weeks without rest.

An inspection which I made some days ago of the principal encampment on the Avenida Brasil, where destitute thousands of all classes are temporarily housed, disclosed conditions of surprising care and cleanliness, a guarantee against sickness and epidemic which many feared as the worst effect of the disaster.

Coming down the coast, the reports of lawlessness and horrors immediately following the earthquake were sensational, but in the main unfounded. There were looters as there were in San Francisco, but they were summarily dealt with by Captain Gomez. Some fifteen or twenty were shot. Reports magnified this to 500. The resolute hope and cheerfulness of the people, Chileans and foreigners alike, is amazing and encouraging. It doubtless reflects the conditions which followed the calamity in San Francisco and shows a creditable spirit of emulation.

The Government plans to expropriate the ruined district, and either to lay out broad avenues and parks, disposing of the remainder at prices which will probably recoup the entire outlay, or to employ part of it in building a sheltered port instead of carrying out the Krause scheme of a new port, which is of doubtful feasibility. The objection to this plan of a port in the Almendral is that the entrance to the new port would be in the most exposed part of the bay, and that it would mean the relinquishment of the present custom house and big public stores, and would measurably contract an already limited plane which the importance of Valparaiso has outgrown. Another plan, to build the sheltered port under the hills in the extreme north-west of the port district, is favoured by many because it would have a maximum of natural protection from the northerly winds, preserve the existing conditions as to Government buildings, and make of the wrecked district a valuable shopping and residential section. Whichever plan is adopted, the Valparaiso of the future is sure to be a more attractive place than the Valparaiso of the past, and the great resources of the country and its phenomenal prosperity for the past five years will justify the cost.

EARLY CHRISTIAN IVORIES.*

I HAVE long held the opinion that with regard to very many of the early Christian ivories, instead of carrying them back to the earliest speculative period, instead of assigning them to the age of Justinian, we ought rather to postpone their dating from one to perhaps three centuries later, to admit that we cannot be precise even within these limits, and to hold that they are the work of the monasteries carrying on for centuries favourite types and traditions,

* From the Cantor lecture delivered at the Society of Arts by Mr. Alfred Maskell, F.S.A.

copying, adapting and reproducing from examples which they happened to possess, and from notes and observations made on their travels or brought by stranger pilgrims and missionaries.

Within a century of the acceptance of Christianity monasteries had been founded in the West in considerable numbers, and continued to increase. It would not be difficult to compile a list of over 1,000 founded between the fifth and eighth centuries. The great monasteries were not, as nowadays, imposing buildings, surrounded perhaps by a park, but vast walled-in enclosures, comprising and governing almost a town, such as we find to this day in Russia. "In the shades of its walls," as Montalembert says, speaking of one of them, "there dwelt a whole nation." They were situated often in remote and secluded places; comparatively seldom in the cities or their neighbourhoods. They were self-supporting, and we know that they were hives of industry, especially in the arts and in the making and illuminating of manuscripts. These latter required sumptuous bindings, and I think it is hardly likely that the monks would have sent to the towns for them. It is possible that the great cathedrals and churches of the Empire, numbering by the time of Justinian over eighteen hundred, may also have required splendid book-covers and reliquaries, but even if so, it is far more likely that in their case these would have been supplied by the monasteries. There were immense establishments as early as the time of St. Martin of Tours [A.D. 400], the apostle of Gaul, in the south of France, in Calabria and Otranto. Greek monks of the order of St. Basil came from the East, from the Nile, from Asia Minor, from Mount Athos to fill the monasteries of the West. They were workers, and they fostered and preserved what arts existed in the troublous times of the seventh and eighth centuries, when the great arts in Europe were almost non-existent. They were the artists, the miniaturists, calligraphers and sculptors to whom we owe many of the ivory carvings we shall presently consider. Not only Greek monks and artists, but crowds of Irish and Anglo-Saxon missionaries swelled their numbers, and contributed, under Byzantine influences, to form a mixed art, tempered, as it could scarcely fail to be, by the Western surroundings, by the still existing monuments of classic times and the first Christian ages, and by the art of the calligraphers and miniaturists of the Celtic and Anglo-Saxon MSS. There must have been a struggle between these Eastern and Western forces even if the East dominated, and there would always have been a special incentive to interchange and to adapt from the MSS. and from the works of art—scanty in number—which the strangers brought with them, or the sketches they had made on their journeys. The chronicles of monasteries, such as those of St. Gall, of Cluny or of Monte Cassino, abound with references to the work of their monks in sculpture as well as calligraphy. From Leo of Ostia, the chronicler of Monte Cassino, we learn that great works were carried out—carvings in wood and ivory—and we are told that they were executed by Byzantine and Moorish artists. One name we know, Tutilo, the monk of St. Gall, in the ninth century. Nor must we forget the founder of the great order of St. Benedict in the sixth century, whose rule expressly enjoins the cultivation of the arts. Doubtless, also, the iconoclastic persecution of the eighth century had the effect of driving numbers of artist monks from the Eastern to the Western monasteries. In those two centuries, so commonly called the Dark Ages—dark, indeed, they were outside the limits of the peaceful monasteries—it is certain that the art of ivory sculpture must have been assiduously practised in these retreats, if only for the adornment of the magnificently-illuminated manuscripts. Then came the Carolingian epoch, the Western Empire of Charlemagne and his successors, under whose rule the monasteries flourished more than ever. It is to ivories of this period that our attention will be frequently called. We shall be obliged in many cases to be contented with the general term Carolingian, for, owing to the conservatism and persistent copying and adapting, national variations were not yet distinct enough to justify with certainty a more specific one. Nor do I think we need hesitate even in the case of such Oriental inspiration, tempered by models taken from nearer home, as in the Lorsch book-cover. We may remember that we call English the work of Solon, of Herkomer or of Tadema. Shortly, it is not disputed that from very early days, before the time of St. Benedict, great monasteries were firmly established. There must have been in them a high degree of cultivation, for even in Merovingian times and until the thirteenth century, nearly all were not

only founded, but were also largely peopled by great princes and nobles. Contemporary writers testify to this.

In ivories, certainly, from the time of Constantine to the Byzantine Renaissance, it is impossible to ignore the persistence of certain types carried from country to country, copied and imitated during many centuries. If there are variations they are not great, for models were probably scanty in number. With the Byzantine Renaissance that art attained its zenith; but the examples of ivories are not many in which we find the qualities of this Renaissance. They are rather of the class produced under the conditions upon which I am now insisting. Certainly, when we come to the ninth century or a little later, Oriental workmanship is easily to be distinguished. The Carolingian sculptors evidently availed themselves of models which we can trace from the still existing examples. I shall refer presently, for instance, to the Carrand St. Paul diptych, the Bodleian book-cover and others, and it is of course from classical sources that the characteristic borders were in some cases directly borrowed. There is little evidence of originality and creative genius. The artists borrowed freely here and there: from the squat figures of the sarcophagi, whether directly or indirectly filtered through the mosaics. They availed themselves of Anglo-Saxon and Celtic MSS. with their foliated borders, or the looped curtains of classical art, and adapted the figures themselves; in fact, from whatever fell into their hands, whether originals or sketches. We seem to find ourselves frequently in the presence of the natural born artist—I ought perhaps to say of the amateur rather than of the cultivated professional. Though there were no doubt schools or ateliers in the monasteries, much as now would have been left to individual initiative: the designer and the sculptor were often, I imagine, not the same or of equal talent. For instance, in the Paris book-covers of the Lupicinus gospels, the sculptor seems to have carried out to the best of his ability designs given him perhaps by the graphic artists of the frescoes. We can well imagine the carver of the capitals of columns trying his hand at this smaller and more delicate work, doing his best but proving in the result that it was not in his line. It is difficult to believe that the sculptor of the Paris book-covers could have had before him the Berlin book-covers if it were from these that he drew his inspiration, or the originals of the small surrounding panels. Of the work of such exceptional artists as the sculptors of the Lorsch tablets or the Munich Ascension plaque, little indeed seems to have come down to us. Here indeed is independent talent of a high order both in design and execution, and if they showed a fondness for and imitated the style of the sarcophagi it is to be remarked that it is strange they should have restricted their choice to comparatively so few models and subjects. We rarely find instances of the symbolism, especially that derived from pagan sources; the vintage scenes, the little genii gathering grapes, the sheep and lambs and rams, the goats, lizards, birds, the variety of crosses held by our Lord, the Good Shepherd, and so on; nor ornaments such as the strigil, which one would have thought they would have seized upon and adapted. Nor when so persistently copying and adapting do they seem to have availed themselves much of the many subjects, ornaments and styles of treatment to be found in the mosaics. The few to which they limited themselves suggest all the more that the sculptors were men shut up in remote parts of the country having access only to the few pieces of small sculpture and to the illuminations of MSS. which found their way to the monasteries or were produced there. I find little evidence to force the conclusion that the ivories in which we see resemblances to the art of the sarcophagi were necessarily executed directly from them, and still less that our ivory sculptors were acquainted with, or had ever visited the catacombs, of whose paintings and ornaments, abundant as was the material, there are no traces of influence whatever. We must remember also in the consideration of the examples which some authorities will have it must be given to Rome that there were other places where sarcophagi abounded, the models for which very frequently came from the ateliers of Rome. In taking into account the influence of Anglo-Saxon and Celtic MSS., we must be careful to bear in mind the Oriental sources—Byzantine, Coptic or Syrian—from which the miniatures and ornaments of these MSS. were themselves derived.

The Painting known as *A Spring Evening*, by the late Arnold Böcklin, has been purchased at the Munich Exhibition for 5,000l.

THE NATIONAL GALLERY.

THE following additions have lately been made to the National Gallery at Trafalgar Square, and the National Gallery of British Art, Millbank:—

"Lady Cockburn and her Children," by Sir Joshua Reynolds, P.R.A. This picture was bequeathed to the National Gallery in 1892 by Lady Marianna Augusta Hamilton, but it was proved in 1899 that that lady had no power to make this bequest to the nation, and the picture was accordingly withdrawn from the collection and handed over to its proper owners. It was subsequently purchased by Mr. Alfred Beit, who generously bequeathed it to the National Gallery. The picture has now been rehung in its former position in Room XVIII. at Trafalgar Square.

The two following works have been presented by the National Art Collections Fund:—"The Harbour at Trouville," by Eugene Boudin; "Portrait of Henry Newbolt" (a pencil drawing), by W. Strang, A.R.A. The former work has been hung in Room XVII. at Trafalgar Square; the latter will shortly be placed in the Gallery of British Art at Millbank.

Mrs. Furse has lately lent a large unfinished picture of "Lord Roberts, with Indian Troops," by the late Mr. C. W. Furse, A.R.A. The picture is hung in Room VI. at Millbank.

TESSERÆ.

Painting and Poetry.

FROM the acknowledged similarity in the principles and effects of the two arts of painting and poetry, the one has been called mute poesy and the other speaking picture. Such is still the very great diversity in their modes and means of exerting their powers that the study of one can, at best, be considered as a general only, and not at all as a technical help to invention in the other; the roads they take, though parallel, lie as entirely apart and unconnected as the senses of hearing and seeing, the different gates by which they enter the mind. The one operates in time, the other in space; the medium of the one is sound, of the other colour, and the force of the one is successive and cumulative, of the other collected and instantaneous. Hence the poet, in his treatment of a story, is enabled to bespeak the reader's favour by a graceful introduction, describing his characters, relating what has already happened and showing their present situation, and thus preparing him for what is to come, to lead him on, step by step, with increasing delight, to the full climax of passion and interest; whilst the painter, on the contrary, deprived of all such auxiliary aid, is obligated to depend on the effect of a single moment. That, indeed, is a critical moment, in which all the most striking and beautiful circumstances that can be imagined are concentrated—big with suspense, interest, passion, terror and action; in short, the moment of explosion, which illuminates and brings at once into view the past, present and future, and which, when well rendered, is often more equivalent to all the successive energies of the poet. The contrariety in their means in some degree separates and limits their fields of operation, and (though there are many subjects equally adapted to both arts) calls, in general, for a different principle in the choice of them. The most striking beauties, as presented to one sense, being frequently wholly untranslatable into the language of another, it necessarily results that many interesting passages in history and poetry are incapable of affording more than a bald and insipid representation on canvas. Of this description is the incident in the Iliad, where one of Priam's younger sons, fallen before the superior force of Achilles, solicits his life on account of his youth. "Wretch!" exclaims the furious hero, "dost thou complain of dying, when thou knowest that Achilles must shortly die?" Such, also, is the celebrated passage in Corneille's "Horatii," where the father of one set of the combatants, on being informed that his son, left single against his three antagonists, had turned his back, appears much agitated and enraged; and when one of his attendants asks, "What should your son have done against such a disparity?" instantly retorts, "He should have died." Enthusiastic strokes of energy and sublimity like these irresistibly command warm and universal admiration; but, unfortunately for the pencil, they defy utterance by any power but words.

Locks in Antiquity.

Denon has engraved an Egyptian lock of wood of very clumsy construction, and such were those of the Greeks

and Romans, or at least some similar. Bars or bolts suspended by chains were drawn backwards or forwards by means of a hook or key, or raised out of a latch and let fall, or a bolt cogged was caught in one of the teeth and drawn back by the key. Sometimes there was a box with a pin, which box received a bar that the pin (balanos) confined. A key in the form of a vice, called balanagra, disengaged the pin, and the bar fell or turned aside. This is the best explanation which can be given of the ancient locks from the descriptions, which are exceedingly obscure. But wooden locks existed in the Highlands, so artfully contrived by notches, made at unequal distances, withinside, that they could only be opened by the wooden key which belonged to them. These were probably Celtic, for locks and keys of metal are found in British towns occupied by the Romans. Before the use of keys and locks they fastened their doors with knots, according to fancy, which were very difficult to unloose, because the secret was known only to the makers. The locks upon scrinia resemble our trunk locks. Those at Herculaneum are very awkward. Du Cange mentions the pessulus versatilis, or turning-latch, box-locks, chain-locks or padlocks, as early at least as 1381; gate-locks, the speldolum or crook by which a chain was let into the lock, and the vertevella not easily defined. The lock and key of Taillebois Castle was vast and substantial, in the form of a fetter-lock. The locks of our old church doors and chests familiarly show their construction. On opening a small ancient brass ring lock the letters on each ring were thus placed together E:R:C:O:L. Nares mentions also a padlock formed of rings marked with letters (AMEN), which when placed to form the word would open, but not otherwise. This therefore is not a modern fashion. It seems that on chamber-doors there were often two locks, one called the privy-lock.

Lawrence's Difficulties.

Much has been said of the pecuniary embarrassments of Sir Thomas Lawrence, and it is to be lamented that the evils of getting into debt were experienced by him at so early a period that nothing short of his passion for his profession could have made him become a great painter. Harassed by day with duns, and fleeced by lawyers and bailiffs, for every pound he owed he paid five; yet such was his resolution that the lost daylight was compensated by his working at night. He has been known, whilst residing in Jermyn Street, and subsequently in Old Bond Street, to paint by the overpowering blaze of a large screen reflecting several Argand lamps, from nine or ten at night until three, four or five in the morning, and after a few hours' rest, take up his palette again, be subject to his daily interruptions and annoyances, and again repairing these evils by his nightly labours until his visage became pallid as that of a marble statue. It is almost appalling to think what a victim the painter for many, many years had been to the cruelty and rapacity of those who live upon the distresses of men like him, who, without even the imputation of vice, are libelled with the want of principle because, being in receipt of a large income, they cannot pay debts thus charged with the exactions of law. He was passive, and submitted to every exaction without a murmur; the moment he had silenced a creditor or had purchased the forbearance of a lawyer, adieu for the moment to all worldly considerations—his whole soul was again wrapt in study. It may be averred in extenuation of censure which has been heaped upon his memory that though he could not liquidate his debts, he had for many years applied more out of the hard-earned profits of his daily and nightly labours than would have five times paid a great proportion of the amount which he owed; and if much of this was swallowed up in law, creditors were too often shamefully culpable in employing such legal agents as those who were let loose upon him—one whom they knew availed not himself of legal means to dispute their claims. Lawrence, though expensive in his pursuits, wished to pay every one, but he was neither an economist nor a financier; and even touching his pecuniary errors—for some he had—he was a man more (aye, almost infinitely more) "sinned against than sinning." Unfortunately for Lawrence he was more than princely-minded in his munificence, for he took all things at every man's own appreciation. He was too generous to be suspicious; and consequently with the class with whom he had to deal he was in nine bargains out of ten the dupe to cunning and stratagem. If a picture or drawing or any object of vertu was offered to him for sale, he did not practise the common habit of the rich and wary, namely, that of depreciating its

value; on the contrary, so that the article was good, even if the proprietor knew not its worth, he was so open, so candid, that he would exclaim, "This is a treasure indeed; it is very beautiful!" and so on; when the dealer, availing himself of the information, would exact a price accordingly.

GENERAL.

The University Court of Aberdeen have agreed to the request of the Royal Academy for the loan, for their winter collection of the works of old masters, of Sir Joshua Reynolds's picture of Dr. Beattie, "The Minstrel." The picture is to be insured for 10,000*l*.

The Scottish Patriotic Association are supporting the movement to have the Borestone at Bannockburn scheduled as a national monument. The Association has sent to H.M. Board of Works a resolution urging the desirability of undertaking the guardianship and preservation of the national relic. They represent that there is grave danger of the ground and relic being encroached upon by mining, industry, tramway extension and building enterprise, and claim that "the relic is identified by the tradition of centuries as the actual stone in which Bruce's standard was set, and the people of Scotland are unanimous in their regard for it."

The Holborn Borough Council at a special meeting last week defeated a motion to rescind all resolutions imposing obligations upon the present Council in respect to the new town hall. The mover estimated they could save the rate-payers 20,000*l*. by the adoption of the alternative scheme. The contractor, the architect and other officials could be compensated.

The City Lands Committee of the Court of Common Council have presented a report on a reference with regard to the removal from the walls and columns in the interior of the Guildhall of the plaster and stucco with which they had become encrusted. The committee stated that it was desirable to free the walls, and recommended that the work should be proceeded with at the early part of the year at a cost not exceeding 350*l*. An amendment that the report should be referred back, and that a full panel should be cleaned to show what could be done in improving the appearance of the interior of the Guildhall was defeated.

An Archaeological Society is about to be organised for the co. Roscommon, similar to that so successfully founded in the co. Galway. Roscommon possesses monuments of antiquarian and historical interest, and many objects of artistic excellence have from time to time been discovered in it. A provisional committee, of which The O'Connor Don is president, has been formed.

The Westminster City Council last week considered a letter from the Further Strand Improvement committee expressing the hope that the City Council would support the application for permission to erect a hoarding 30 feet high between Aldwych and the Strand in order that the public may realise, before it is too late to make any alteration, what would be the effect of building on the present line of frontage. The improvements committee of the Council is not in agreement with the proposal, and recommended accordingly. The recommendation was adopted by a large majority.

The Lord Provost's committee of Edinburgh Town Council recommend approval of the appointment of Mr. J. Dick Peddie as architect for the new municipal art school in the city.

A Sessional Meeting of the Royal Sanitary Institute will be held at the Parkes Museum on Wednesday, December 12, at 8 P.M., when a discussion will take place on "The Advantages and Disadvantages of Heating Buildings by Gas Stoves of Various Types," introduced by Mr. S. Rideal, D.Sc.Lond., F.I.C., to be followed by Mr. T. W. Aldwinckle, Mr. F. W. Goodenough, Professor H. R. Kenwood, Dr. Louis C. Parkes and others.

Mr. André Cernogio has informed the Vice-Rector of the Académie de Paris of his intention to endow the University with 12,000 francs a year for the encouragement of students of all nationalities who work in the laboratory created by the late Pierre Curie and Madame Curie. They are to be known as Bourses de Curie.

The Late William Linnell, of 40 Elm Park Gardens, Fulham, the landscapist, who died September 26, left estate valued at 29,801*l*. 14*s*. 10*d*., with net personalty 22,827*l*. 14*s*. 6*d*.

Mr. T. Fairman Ordish, F.S.A., will deliver an address on "London as Seen by Shakespeare" at the annual meeting of the London Topographical Society at the Society of Antiquaries on Tuesday.

The Institute of Oil-Painters have elected the following members:—Messrs. J. Buxton Knight, Hugh Riviere, Adam E. Proctor, C. M. Q. Orchardson, W. Ayerst Ingram and G. C. Haité.

The Leicester Town Council have instructed a special committee to consider the question of erecting a public hall. This action arose out of a communication from the local executive of the British Association with reference to the provision of a public hall available for use at the meetings of the Association in Leicester next year.

Promises Amounting to 1,000*l*. have now been received by the committee formed with the object of raising 7,000 guineas to purchase for the nation Holman Hunt's *The Lady of Shalott*.

The Salford Town Council have appointed a sub-committee to ascertain the accommodation which would be required by the various departments if a town hall was erected.

Mr. Mervyn Macartney, architect to St. Paul's Cathedral, states that in consequence of his report on the condition of that building, the Dean and Chapter, in view of the great importance of the matter, have decided on his recommendation to invite Mr. T. E. Colcutt, Sir Aston Webb, R.A., and Mr. John Belcher, A.R.A., to form a committee of inspection as to the condition and circumstances of the structure. He adds that "the public may therefore be assured that their report and investigation will be an impartial one."

Mr. MacGregor Chalmers, architect, has prepared plans for the erection of a new parish church at St. Andrews. The cost is estimated at between 23,000*l*. and 24,000*l*. Work will be commenced in the spring.

The Corporation of Glasgow have extended the date for sending in competitive designs for laying-out the estate at Reddrie with small dwellings from December 12 to January 12, 1907.

The Following Resolution was passed at a recent meeting of the council of the Cockburn Association with reference to the proposed restoration of the Chapel Royal at Holyrood:—"That this meeting hails with the greatest satisfaction the prospect of the restoration of the nave of Holyrood Abbey Church. It regrets that this part of the building has so long been allowed to continue a desolate ruin, but rejoices in the prospect of what still exists of one of the most interesting buildings in Scotland being preserved from further dilapidation. Accordingly it desires to record its high appreciation of the patriotic spirit which inspired the late Earl of Leven and Melville to make provision in his will for carrying out the restoration, and for the thoughtful care displayed in the appointment as architect to take charge of the work of Mr. Thomas Ross, than whom, in the opinion of this meeting, there is no person better qualified. Further, this meeting humbly and respectfully ventures to express the hope that His Majesty the King will be graciously pleased to consent to the proposed restoration."

Mr. Mond, M.P., recently asked the Secretary for War whether, in view of the admitted danger caused to the National Gallery in case of fire by the recruiting station immediately at the back of the Gallery, and the promises already made for the removal of this building, he would give instructions to have this carried out without further delay. Mr. Haldane, in reply, said he could not admit that the proximity of the London recruiting depot was a cause of unusual danger to the National Gallery. There were some shops distant from the west end of the Gallery about 22 feet only, whereas at the nearest point there was a space of 110 feet between the Gallery and the War Department buildings. The buildings which stood upon this intervening space were pulled down at the end of 1902.

The Highways Committee of the London County Council recommend that the quantity surveyors to be employed for measuring up the work in connection with the erection of the Holloway (Pemberton Gardens) tramways car-shed be paid at the rate of 2 per cent. upon the cost of the building.

The Gas Committee of the Birmingham City Council have provided a recreation-room for the men employed by the department. The building has been erected in Devon Street on land belonging to the department, and, together with the necessary equipment, will involve an expenditure of about 3,500*l*. It is to be used by the employés for social and recreative purposes, the principal apartment being of sufficient capacity to accommodate 400 people.

The Architect.

THE WEEK.

STRANGE claims have been put forward under the Workmen's Compensation Act, but we doubt if one resembling that on which a case was based in the Irish Courts has been heard in England or Scotland. Last year a man was employed in Castletown Bearhaven as foreman in carrying out a contract for the drainage of the town. One holiday several drunken fishermen amused themselves by breaking the pipes which were exposed. The contractor demanded payment for the damage and was attacked; the foreman went to his assistance and was stabbed. He subsequently died from his wounds, and the culprit was convicted of manslaughter. The widow of the foreman brought an action against the contractor under the Workmen's Compensation Act, on the plea that her husband's death was caused through an accident arising out of and in the course of his employment as foreman. The County Court Judge awarded her £41. 16s. The Lord Chancellor of Ireland, relying on the judgment in *CHALLIS v. The London and South-Western Railway*, held that the accident was not one of the kind that came under the Act; it was not incidental to the work, and was strongly repugnant to the nature of the employment. The two Lords Justices concurred with the Lord Chancellor; the award was therefore set aside and the compensation was not approved. The case casts a lurid light on the peculiar conditions under which work has to be executed in Ireland. In the first place, there is a wanton destruction of the contractor's property, and the demand for payment gives rise to a fight with knives. In England the manslaughter of the foreman, if such an event could occur, would not be considered as incidental to the employment, but it cannot be said the same distinction applies in Ireland.

THE public health committee of the London County Council are desirous of obtaining more stringent powers for dealing with houses let in lodgings. Three years ago it was stated that although 672,030 tenements of less than five rooms were found in London, only 16,433 were registered under the by-laws. It is estimated that 7.9 per cent. of the tenements are in blocks of artisans' dwellings which could not be registered. The small number of registered houses is supposed to be due to exemption clauses in the by-laws. The Council have been advised that the clauses are illegal, but the Local Government Board take a different view. Owing to the exemption there cannot be efficient supervision of sanitary defects, nor can overcrowding be prevented. If it were less easy to secure exemption there is no doubt that overcrowding would be less general in the Metropolis, which would be advantageous to the public health.

If the report of the Housing of the Working Classes Committee should become law not only will a large amount of work be necessary in carrying out improvements throughout the country, but there will also be an increase in the number of officials employed by district and other councils. It is proposed, in the first place, that a register should be prepared on which every building used for human habitation will be entered. The owners of such property will, moreover, have to send in a return every year describing the sanitary condition of all the dwellings, and penalties are to be inflicted for false returns. "Sanitary defects" will have a wider signification. The Local Government Board is also to have a housing and public health department, with a staff of travelling inspectors, who will hold inquiries into any complaints. Loans are to be granted on easy

terms. In such cases the whole of the expense should fall on those who derive profit from the insanitary property. But it may be taken for granted that more or less of the outlay will be borne by other people.

ONE of the signs of degeneracy is the increase in the number of lunatics for whom the public have to provide. The necessity for expedition in building asylums is indicated when we find Mr. VICKERS-EDWARDS, the architect of the West Riding of Yorkshire, advocating the creation of an architectural department for lunatic asylums alone, with architects who would not be allowed to accept other commissions. Under the present system of submitting plans to the Lunacy Commissioners, who in turn consult various architects, it may take ten years before an asylum is completed. The exigencies of the time do not allow of so long a delay in providing accommodation. In the West Riding, before one asylum is ready for use it becomes necessary to look out for a site for another. As with workhouses, there appears to be too much of a monopoly in respect of designing asylums, and the Lunacy Commissioners should take care to avoid giving encouragement to a system which is likely to give rise to serious inconvenience.

IF Essex is to become a diocese there could not be a more appropriate place for the episcopal chair than the borough of Colchester. It is believed that HELENA and CONSTANTINE, who were the earliest of the great Romans to take the Christian Church under protection, were connected with the Essex borough. Indeed, it was believed that HELENA could claim Colchester as a birthplace. The late Mr. MORANT, the historian of Essex, and who largely contributed to *The Architect*, says that Colchester was a bishop's see, and that in the fourth century the bishop was present at two at least of the Councils. There are several remains testifying to the importance of Colchester in Mediæval times, and the circumstance that there are sixteen parishes in the borough is enough to show that it was no lax supporter of the Church. The town has also advanced with the times, and presents to the visitor a rare combination of the new and the old. It has also the advantage of possessing a building that would serve as a pro-cathedral in the large church of St. James. A cathedral site committee has been already formed, with Mr. C. A. BENHAM as honorary secretary, and there is little doubt their efforts will be crowned with success.

THE Board of Education in their last report for 1905-6 point out the unsuitability of some of the Municipal secondary schools. Although much is done to remedy the worst defects, new buildings will be required in various places. The following is the official description of a typical example:—"The building in which the school (a Municipal dual school) is conducted has to accommodate both the secondary school and also boys and girls' elementary departments, each of which comprises three standards. The building is not well planned for the purpose of a secondary school; the classrooms have all been designed and are seated to hold sixty, so that much room is wasted. The accommodation is also deficient. The highest class has to be taught in the science lecture-room, which is not suited for class purposes. The large halls in both the boys and girls' departments are occupied by classes, so that they are apparently not available for prayers and assembly in the morning. On some occasions also it is necessary to take two classes in the same room." The designers of such buildings are not to be blamed. They were commissioned to produce elementary schools. The scope of the official system has since been widened, but neither School Boards nor the officials in the Education offices were able to anticipate that very different purposes would have to be subserved by the ordinary schools.

THE ROYAL HIBERNIAN ACADEMY.

IN July 1905 a committee was appointed by the Government to "inquire into the work carried on by the Royal Hibernian Academy and the Metropolitan School of Art in Dublin, and to report whether any—and if so, what—measures should be taken in order to enable these institutions to serve more effectually the purposes for which they are maintained." The inquiry occupied five days in October and November. It may seem remarkable that a whole year was required for the preparation of the report. But that period will not appear to be excessive if we remember that the issue was whether a Government system or a body of individuals was better fitted for the purpose of advanced art teaching in Ireland.

The members of the committee were selected with care. The chairman, Lord WINDSOR, now Earl of PLYMOUTH, served as First Commissioner of Works. He has written on art, and he is known as a patron of the arts. Lord WESTMEATH is an Irish peer who has held various offices, and who has taken an interest in educational subjects. Mr. Justice MADDEN is known as a lover of the *belles-lettres*. Mr. G. C. V. HOLMES, the chairman of the Board of Public Works in Ireland, is an Irishman who made a reputation in England as a mechanical engineer. Lastly, Mr. J. P. BOLAND is an Irish member who was educated at Oxford. With the exception of the chairman all the members were therefore Irishmen, and we are afraid it will be said that was the reason for the appearance of two reports. It would, we think, have been an advantage if one of the committee had been a member of the Royal Academy. But, on the whole, there can be no doubt such a committee was well adapted to deal with the subject.

In one sense it was also to be regretted that the inquiry was not confined to the working of the Royal Hibernian Academy. To contrast an institution with a settled income of 300*l.* a year with a Government department on which at least 4,000*l.* is annually spent, and for which much larger sums are available, is like a testing of the physical work performed by a giant and by a dwarf. The dwarf's work may be infinitely more graceful and useful in the end, but it appears insignificant when the dynamometer alone is employed. To a committee composed mainly of officials it must necessarily appear that officialism alone can cope with the difficulties, however varied, which arise in any civilised country.

The Royal Hibernian Academy would not be worthy of its name if it did not present many anomalies. At no time did Ireland require an academy of art. In the belauded days prior to the Union the Irish nobles and gentry occasionally employed a native portrait-painter or miniaturist. But they seemed to have a craze for works of old masters. The numbers of such products which still exist throughout the country are astounding. The premises of the Royal Hibernian Academy are not extensive, yet even there big Italian pictures were discovered of which there was no record. Occasionally when the Treasury was more full than usual the Irish Parliament used to make a grant to one or other improvised society of artists. But the money did more harm than good. Rivals were created, and it is on record that on one occasion at least an opposition society took possession of an exhibition, closed the gallery, and then made it over to one of the invader's agents. As late as 1815 we find the Hibernian Society of Artists appealing to the Dublin Society for protection, giving as a reason that they at least did not appropriate the funds gained from exhibitions to their own personal use, but conscientiously applied them to the relief of aged, decaying or distressed artists. The explanation of the unseemly disputes is found in the small sums which were obtained by the sale of paintings, and the unfortunate artists had to fight for any windfalls which were forthcoming.

Irishmen have a superstitious belief in the virtues of documents coming from the English Government. One

party of the artists thought they had gained the upper hand by obtaining a Royal Charter on August 2, 1823, constituting a Royal Hibernian Academy, which was to consist of fourteen Academicians and ten Associates, who were to be professional painters, sculptors or architects. It was characteristic of disunion that about the same time the Royal Irish Institution was founded to hold exhibitions of the works of ancient masters, or, in other words, to confound the present by the past. The first president of the Academy was WILLIAM ASHFORD, but he held office for only a year. FRANCIS JOHNSTON, the architect, succeeded him, and on the king's birthday in 1824 laid the foundation-stone of a building in Lower Abbey Street, which has since been used by the Academy. It was erected from his design, and he made it over to the Academicians at a rent of 5*s.* a year. A plate in the foundation-stone stated that the building was to serve for the use of the members and to form a national school of art. After JOHNSTON'S death a statue gallery was erected by his widow and assigned to the Academy on similar terms. Hence it is that the total rent is only 10*s.* a year.

It should be observed that the Academy was under no obligation, so far as we know, to use the building as an art school. There was no grant originally from Parliament. In 1832 a grant of 300*l.* a year was given. But for what purpose does not appear to have been stated. One fact, however, is manifest, that although the Academicians may have been generally wanting in skill as artists, in no instance have they neglected any of their obligations. What knowledge they possessed they were ready to impart. The first exhibition was held in 1826, and pictures were shown annually until 1838. Then there was a collapse. The painters found that purchasers were not forthcoming, and it was in vain they laboured. Visitors objected to exhibitions which mainly consisted of inferior portraits, sketches and landscapes. The establishment of an art union gave some impetus to the Academy, and the exhibitions were resumed. That they still failed to be attractive is evident from an account given by THACKERAY of a visit in 1842. It was the last week of the exhibition, and crowded rooms might be expected. THACKERAY found he was alone, with the exception of the money-taker and the porter, who were discussing some recent murders, and "the echo took up the theme and hummed it gloomily through the vacant place." Then two ladies came in, to whom he presented his catalogue. Yet at that time the Academy possessed some excellent artists.

The Academy continued to receive their grant under a special vote of Parliament until 1858. Indeed, for a time it was the only institution of the kind in Great Britain which received public money. HENRY COLE could not approve of so much independence, and Mr. NORMAN MACLEOD, his lieutenant, was sent over to investigate matters. He considered that it was useless for the Academy to depend on artists residing in Dublin, and he proposed that while there should be a sufficient number in Dublin to form a Council, the Academy should contain the names of all the best Irish painters, sculptors, architects and engravers wherever they were to be found. Mr. MACLEOD said that the answer invariably given when the question was asked why the exhibitions were so unremunerative was that the Irish public were not competent to appreciate art. To that he replied that public taste might improve in Ireland; that the wealthier classes might learn to appreciate the work of native artists and to encourage them sufficiently to stay at home. The result of Mr. MACLEOD'S visit was that the Royal Hibernian Academy was subjected to the Science and Art Department, and that the 300*l.* a year was only to be granted after a yearly visit and a report from one of the Department's examiners.

The optimism of Mr. MACLEOD has not been justified. The "appreciation" of art by the wealthy classes can be tested by the commission on sales of works exhibited at the Royal Hibernian Academy. A return has been made of the amount received during

thirty years, beginning with 1875. In that time the sum realised was 2,282*l.* 14*s.* 2*d.*, or a yearly average of 76*l.* 1*s.* 9*d.* That amount, if compared with the returns of the Royal Academy, would be considered as insignificant. But it becomes more strange if the receipts are considered in decades. During the first ten years the average per annum was 124*l.* 16*s.* 2*d.* During the second ten years the average was 64*l.* 16*s.* 3*d.*, and during the third ten years 38*l.* 13*s.* The commission obtained in 1904, the last year mentioned, was only 27*l.* 9*s.* 9*d.* The same peculiar sort of "appreciation" has been seen in the number of visitors. During the first ten years the average number of season-tickets sold was 542; during the second period the average was 303, and during the third the average was eighty-four. Last year there were only twenty-five sold. Some of the witnesses ascribe this remarkable falling-off to the position of the Academy in Lower Abbey Street. The north side of Dublin, of which the street is part, has been declining in value, and Abbey Street was never what could be called a fashionable thoroughfare. Any stick, it is said, will serve to beat a dog, and people who are indifferent to art in general, and to modern Irish art in particular, may offer as an excuse the inaccessibility of the Academy's building and the depressing effect of the interior. Dublin was once described as the most "car-drivingest city in the world," and Abbey Street could be reached at a cheap rate from all parts of the city and the suburbs, while now tramways, with other means of conveyance, exist in excess.

Three of the committee, viz. the chairman, Lord WESTMEATH and Mr. HOLMES, cannot bring themselves to recommend a change. They say:—

"Although admitting that the site in Abbey Street is not an ideal one, taking into consideration the circumstances we have already mentioned, and bearing in mind that all the main lines of electric tramway of Dublin pass within sixty paces of its doors, we do not consider that there is at present sufficient justification for recommending the purchase of a new site and the rebuilding the Royal Hibernian Academy near Merrion Square. Unless the Corporation of Dublin, following the example of Glasgow and Edinburgh, offered substantial assistance, the proposal would involve the expenditure of a large sum of public money, and there is no reason to suppose that the change of site in itself would necessarily improve the status of the Academy, or raise the standard of its exhibitions, without which it could hardly look for increased public support."

The minority report by Mr. Justice MADDEN and Mr. BOLAND, on the other hand, declares that—

"It is plainly essential to the prosperity, and, indeed, to the continued existence of the Academy, that it should be properly housed in a suitable position, and the action of the State in regard to the Academies of England and Scotland justifies us in reporting that this should be done at the expense of the State."

When the indifference of the people of Dublin to the Hibernian Academy during the whole term of its existence is considered, it would seem to be a waste of public money to increase facilities which are likely to be neglected. People who are expected to look at pictures need not contemplate the state of decay in Abbey Street or elsewhere. Irishmen and Irishwomen will visit picture galleries in continental towns which are not so easy of approach as the gallery of the Academy in Dublin. On the other hand, they can say that in London care is taken to make picture galleries, whether public or private, easy of approach. In London a similar rule seems to exist for theatres and picture exhibitions, for they are separated by the shortest distances. People in Dublin who are penurious, idle and indifferent expect to be treated like the people of London, who are sure to repay any outlay made for their convenience.

The recent grouping of some new buildings connected with art, literature and science is also enough to persuade the perverse Irish intellect that the

Hibernian Academy and the works it exhibits are outside the things worth visiting. Sir THOMAS DREW, as president of the Academy, might be taken as a prejudiced witness when he advocates removal. But Sir JAMES GUTHRIE, the president of the Royal Scottish Academy, was most emphatic about the necessity for placing the Academy in the vicinity of other educational institutions. Sir CHARLES CAMERON, who is well known as an officer of public health and as a professor of science, has lived for a great many years in Dublin. He believes that if the Academy stood in the region suggested more pictures would be contributed, a larger number of persons would visit the exhibition, and some of them probably would be induced to study art. Colonel PLUNKETT, the Director of the Science and Art Institution, Dublin, considers that the Academy is handicapped by its very bad situation, and that a new building should be erected provided with studios in which students could work under the direction of artists of experience. Sir WALTER ARMSTRONG, who, as director of the National Gallery with its ancient masters, might be thought to represent rival interests, also testified to the unsatisfactory character of the building belonging to the Hibernian Academy, and he gave instances of some modern exhibitions which were successful when held in the part of Dublin which is preferred, but which must have been failures if held in Lower Abbey Street. Sir WILLIAM ABNEY, who at one time was sent over to study the question, recommended that the Board of Works should secure suitable premises for the Academy in the neighbourhood of the new National Gallery. In fact, the majority of the witnesses were decidedly in favour of a change, although three of the five members of the Committee take a different view.

We hope for the sake of Irish art that after consideration of the evidence the Government will not approve of the recommendation of the majority report, that the Hibernian Academy should be retained for exhibition purposes only, and that repairs be carried out at the public expense. Simple as it may seem, that course if adopted would be a death warrant to the Royal Hibernian Academy. As we have said, FRANCIS JOHNSTON made the foundation-stone testify that the Academy was not intended solely for the purpose of exhibitions of works by the members, but that it was to become a national school of art. To take away that power from the Academy and to suggest that the members should serve merely as occasional visitors in the Government school of art would be to create a condition of affairs of which we hope the Academy will not approve. The appendage R.H.A. to their names would be dearly purchased by the sacrifice of the essential principle of the Academy. In spite of the inadequate encouragement teaching was always recognised by the Academy, and under new conditions in the newly created educational oasis a fresh impetus would be given to improvement. In its way the Hibernian Academy represents the academic principle, which at least dates from the beginning of the Renaissance. To substitute for it a sort of machine-like cramming would be fatal to Irish art, for if the Academy comes to an end or is deteriorated there is no existing society to serve as a substitute.

HOUSES AND GARDENS.*

THERE was a time when everyone would know that a book on houses if not on gardens was addressed to architects alone. Of late years its destination is expected to be the studies of people who are likely to become clients. If there were any doubts about the purpose of Mr. BAILLIE SCOTT'S volume they would quickly be dispelled by some of the earlier pages. In the introduction we read:—

The art of building as practised in modern times is not so much an art as a disease. In the early stages of the

* *Houses and Gardens.* By M. H. Baillie Scott. (London: George Newnes, Ltd.)

Victorian era it took the form of a pallid leprosy. Nowadays it has become a scarlet fever of red brick, and has achieved a development of spurious art expressed in attempts to achieve the picturesque, which in its smirking self-consciousness has made the earlier candid ugliness appear an almost welcome alternative. There is no town or village but is being gradually disfigured by this plague of modern building, and one has almost forgotten that houses have been and may yet be an added beauty rather than a disfigurement to the land. And in matters of furniture and decoration one finds the same spurious art on all sides, so that the modern house of the average citizen has reached a stage of degradation which might be a subject for ironic laughter if it were not for the pity of it. The serene and earnest beauty of the old house is everywhere being replaced by a superficial smartness posing as art. It is difficult to know where to turn to escape from this oppressive nightmare of hideous building. Here and there one may find houses built and furnished with sincerity, but these are comparatively so few that they appear but as drops in the ocean. It is doubtful whether education will provide relief, for it is mainly the modern Board school which provides the most convincing object-lesson of the degree of depravity of which building is capable. Nor is it possible to hope for much from the Church, where building activities have recently been mainly concerned with the disfigurement of the ancient glories of its buildings and in the construction of elaborate and unconvincing forgeries of an obsolete art.

We do not find in books relating to business or professional matters of other kinds a like assumption of superiority on the part of a writer and a similar condemnation of the works of contemporaries. Even shopkeepers do not criticise their rivals' wares in such a style. It is the unenviable peculiarity of architects to endeavour to make out that each of them is the only one in whom trust can be placed. And yet when we think of the kind of buildings represented in Mr. BAILLIE SCOTT's pages we must regard his assumption of superiority more in sorrow than in anger. He is an advocate of houses supposed to be adapted for those who would lead a Simple Life. They almost recall the descriptions of the dwellings of the Vikings and other primitive amateurs, which were erected in times when forests abounded and men could lavishly use timber. Those builders at least were simple in their arrangements because their knowledge was confined, and they had only one way of building. Nevertheless, in setting up houses of that kind in our time, we are only affecting to be unaffected. The would-be simplicity, no doubt, has responded to a fad of the time. However, there are signs enough around us that sensible people are becoming ashamed of being deluded into counterfeiting a condition of life which possibly was good enough in its day, but which in our time is only one more addition to the numerous illusions which few have the strength or the good luck to escape. A more elegant, refined and modern form of house is required for the twentieth century. Ten or a dozen years from hence such a book as Mr. BAILLIE SCOTT's may excite wonder, and all his hectoring has therefore a melancholy sound. In once place, he says:—"The man who lives at 'St. Mildred's' or 'The Pines' might, after rechristening his house more appropriately as 'The Crime,' seek to reduce its pernicious influences by some such means as I have endeavoured to describe." If the individual in question obeyed our author, has he any guarantee that in a very short time the transformation of his house would not make him the laughing-stock of his neighbours?

While saying this, we must admit the cleverness of the writing and of the designing. The interior of an ordinary room is not always agreeable to the sight. If there is variety in the planning it loses its effect by commonplace wall-paper and by furniture of familiar forms. In ordinary life it is not pleasant to be entertained by a neighbour who has the same grocer or wine merchant as oneself. In the decoration and furniture of rooms there is a like defect, for they all somehow appear to be the products of the same trades-

men. Now the coloured interiors which Mr. BAILLIE SCOTT presents may sometimes suggest Mr. PEGGOTTY's house at Yarmouth, but it must be allowed that no two of them are alike and they are not suggestive of collections of woodwork turned out with several hundred more by means of ingenious machinery. It would, however, be interesting to discover how long an ordinary individual after his first surprise was over could dwell in such a house without wishing to have a season in a modern hotel near some big railway terminus. In describing a house called "Findon" Mr. BAILLIE SCOTT says:—"This house was designed for a client who had no delusions about picturesque roof lines and quaint arrangements of gables, but who recognised the merits of simplicity both from an artistic as well as an economic point of view." We should like to gain some information about that client's experience of the solid timber, the whitewashed plaster and the whitewashed woodwork of the ceiling—for whitewash is the principal decoration of the house.

The book may be considered as a treatise on the production of houses of the "Findon" type. There are several English examples given, and Mr. BAILLIE SCOTT has been fortunate in designing houses in America, Switzerland, Poland, &c. "A House for an Art Lover" obtained the first prize from a jury of German architects in a competition organised in Germany. The plan is peculiar. The principal bath-room and the children's breakfast-room are octagonal, and the composition may be described as scenic. The architect would not admit that in designs which seem to be all allied, but which can be used in places far apart, that their acceptance depends on eccentricity. There is one passage which we suppose may be taken as a defence of his manner of treatment, and which on that account we give at length:—

To consciously aim at achieving "style" in design, either old or new, is to follow a will of the wisp. For the pursuit of style, like the pursuit of happiness, must necessarily lead to disappointment and failure. Both alike are essentially by-products, and the quality of the by-products is in direct ratio to the worthiness of the ideal pursued. One may liken style to a jewel in the hilt of a sword, which flashes brightly when the blade is drawn in a worthy cause, and to which the warrior absorbed with the matter in hand will give but slight attention. It is a quality of the "flower of things," only to be gained by root culture, and he who aims at style is he who would paint the lily instead of watering it. To produce a stately modern apartment it is not necessary to disinter the Corinthian column, or to set the modern workman once more to carve that oft-repeated formula of acanthus leaves at the bidding of some blind pedant who has no eyes for the beauty of the flowers and trees which surround him. Such vain repetitions do but destroy our sense of the beauty of their originals. It is well that the apartments of the mansion should be of stately and dignified aspect, but let it be a stateliness and dignity which is vital, local and modern, the new thought of a new age wrought with eagerness and care, instead of the trite and stale copyism of the forms of the past. It is not necessarily true, as many seem to imagine, that the only alternative of this copyism is a bizarre striving after originality and eccentricity of design, and which, posing as the "new art," is justly condemned by the judicious. New work which is based on the study of the past, which is sane, reasonable and vital, will only be considered eccentric from the point of view of those whose thoughts revolve round obsolescent centres. Apparent eccentricity is the necessary concomitant to every advance in thought, and new ideas revolve round a centre which is constantly moving forward. The impressions of the surrounding country reported by the vanguard must necessarily seem untrue to those in their rear, but gradually as these are pushed and hustled forward they reach the same standpoint and recognise the truth of the picture. Architecture as expressed in house building and adornment is like all human affairs, necessarily in a state of flux—to live is to advance; and so, while holding fast that which is good, let us still hope for that which is better, and not let our admiration for past glories blind us to the undreamed possibilities of the future.

Mr. BAILLIE SCOTT has some very useful remarks concerning gardens in connection with small houses. Few men engaged during the day in business have the energy which will enable them to work at digging, planting or mowing before and after office hours. The majority of gardeners imitate other workmen in doing as little work as possible, and consequently they are expensive. The author recommends that nature should be allowed some liberty, and in the wild garden he would plant fruit trees. The Japanese, who understand gardens, appear to find most delight in fruit trees when in blossom, and their example should be followed. The introduction of the pergola is also recommended, and it is a feature which increases the effect without much outlay. It must be allowed that the influence of the garden can be traced both in Mr. BAILLIE SCOTT'S designs for houses and in his description of what is desirable in their ornamentation, and adds to the interest of the book. The volume, indeed, must be considered as attractive, although it may be difficult for an architect to submit to the exalted claims arrogated by the author, as if he alone possessed the secret of designing a modern house.

SCULPTURE IN RELATION TO ARCHITECTURE.*

IT is no light task for a layman like myself to address an assembly of experts upon any aspect of architecture. But, emboldened by the honour which has been done me by your Council in inviting me to speak to you to-night, I venture to place before you the views of a theorist upon the relations between the sculptor and the architect, which you will be able to appraise in the light of practical experience. After all, counsels of perfection are means to an end, the end in this case being the achievement of practical and lasting beauty in the harmony of sculpture and architecture.

Perhaps it may be as well to assign a broad but definite meaning to the term "sculpture." By that term I shall everywhere imply the sculptured representation of natural objects in their natural form, while by "carving" I should understand the representation by the same means of conventionalised forms of ornament. More especially I propose to deal this evening with the use of animate forms in architectural sculpture.

If I may be allowed to give expression to a few elementary truisms, it may serve to make clearer the point of view from which I propose to regard architectural sculpture.

Firstly, then, the object of architectural sculpture is to beautify, not merely to be beautiful. It is not sufficient that a building should be beautiful in proportions, and its sculpture beautiful in form. This might be the case without the slightest sympathy between the two, and in such circumstances the two arts would defeat one another, instead of being mutually contributive to a harmonious whole. A clumsy, ill-built and ill-proportioned building, encrusted with the most exquisite sculpture, is not beautiful, nor is a fine architectural achievement enhanced by ill-conceived and ill-executed sculpture.

Secondly, it is of the greatest importance that the sculpture, being perfectly sympathetic in style with the building, should also be sympathetically disposed about the edifice. On no pretext must its presence be allowed to disguise or weaken or falsify the structural lines of the building. For it is as obvious as anything can well be that the first beauty of a building is its strength. If that strength be disguised in the smallest degree all ornament is nothing but an additional burden upon the apparent weakness of the building. The blank wall of a reservoir-dam is beautiful in its impassive strength, and that strength is of such paramount importance that the least ornament would be trivial and weakening in effect, unless placed at the very crest of the wall above the known water-line. But sculptured figures standing on the coping would be perfectly permissible, even desirable, if not on too large a scale, for by their very lightness they would serve to accentuate the massive power of the dam.

Another example may be drawn from the borderland of architecture and engineering, viz. the decoration of a bridge.

Here it is plain that while massive sculptures may be piled upon the spring of the arch on either bank, no free sculpture must appear over the keystones, except perhaps in the form of a small figure on the keystone itself (as, for example, in the Arch of Titus, at Rome); while over each pier the groups of sculpture which may be introduced must be pyramidal in the general scheme of their composition. The Charles Bridge, between the Mula-strana and Nove-strana, at Prague, is a good case in point.

The sculptures which may appropriately flank the approach to a bridge are free and lively compositions of broad base. The Boadicea group on the Embankment is worthy of note as a fine bridge-sculpture wisely placed. It should face away from, not across the bridge, and a corresponding group should appear on the opposite side, to say nothing of a pair at the Lambeth end of the bridge. The Pont Alexander III., at Paris, exhibits well-placed groups of sculpture.

These, however, are instances of the axiomatic necessity which is incumbent upon the sculptor of paying due respect to the structure which he is to adorn. But, as a matter of fact, his mission is a far higher one than this.

The great difficulty which retards the progress of sculpture as a means of architectural adornment lies not so much in the arts as in the artists, for I must include both architect and sculptor in my mild indictment.

The mutual respect which undoubtedly does exist between the artists of both branches of beauty—the structural and the plastic—is, I fear, largely coloured by mutual distrust—a circumstance of which the immediate outcome is a lack of perfect co-operation. This lack of co-operation has for its fruit a corresponding lack of harmony between the respective provinces. I have pointed out elsewhere that the general impression conveyed by the sculptured figures on London buildings of recent date is that they have climbed out on to the tops of the windows or on to the parapets, and continue to recline upon their giddy couches because they are unable to retrace their perilous steps. In other words, they form no integral part of the buildings which, by their mere presence, they certainly do much to adorn. This impression can only be due to the fact that these buildings could perfectly well dispense with their presence—that sculpture is not an inherent part of the design, but may be included or omitted according to the margin of "extras" that the funds are likely to bear. The architect feels—and often rightly feels—that his powers of design are in no way dependent upon extraneous adornment, and thus is rather inclined to regard the sculptor in the light of a rival than a coadjutor—a feeling which is bound to react upon the sculptor and to have a detrimental effect upon his work.

It is perfectly true that a building would stand as firmly upon its foundations, that its proportions may be as true, its spirit as noble and its utility as complete without the aid of sculpture as with it. But in one respect a building upon which no sculptured figures find a place falls short of the highest glory. It has no voice, it is silent, uneloquent of its purpose. Even a prison, whose grim soul is the very spirit of silence, may render its grimness more telling if it be sombrely enriched with appropriate sculpture.

It may be granted, then, that the use of sculpture is, at times, of actual value to the architect, and this being so, all that remains to be insured is that such sculpture be, firstly, of the right kind and, secondly, rightly used.

It is at this point that I would beg your leave to illustrate my remarks by the description of the most complete and perfect scheme of decorative figure-sculpture in the world, viz. the Parthenon. And in my account of its sculpture I shall regard that monument of Athenian greatness not so much from the purely architectural as from the national and spiritual point of view, paying as much regard to the circumstances of its conception and the purpose which it served as to its actual form.

The decoration of the Parthenon consisted, as I need hardly remind you, of the pedimental sculptures, the Doric frieze of metopes and the Ionic frieze which ran along the top of the outside wall of the cella. The natural approach to the temple was towards the western front, and from this point it was open to the visitor to proceed to the eastern end and main entrance either along the southern or northern side of the temple. The most natural route would be along the northern side, straight down the central vista of the Acropolis.

Naturally, the first sculpture to strike the eye was the great pedimental group representing the contest between Athena and Poseidon for the land of Attica—a story of

* A paper read before the Society of Architects, December 13, by S. Charles Kaines Smith, B.A.

intensely local interest, the choice of which marked down the Parthenon as a deliberate claim upon the goddess as the patron saint of the city to which she had given her name in the far-off days. Thus the story chosen for representation brings home at once and forcibly the intensely national aspect of the goddess and her shrine, and prepares us for the general scheme of decoration and its ultimate *dénouement*, dramatic in its simple force.

Strong and telling in the clear Attic sunlight the vigorous relief of the metope sculptures next claims the eye. The nature of the Doric frieze demands the representation of detached groups in a severely square frame. Thus all depend upon vigour of action and power of line and shadow, if the monotony of the obviously structural frieze is to be relieved without falsification. And on this principle we have a series of pictures representing vigorous action—Greek and Amazon in deadly conflict, recalling the deeds of Theseus, the greatest hero of old Athens, in the days when the gods walked the earth—and thus the local appeal of the building is further emphasised.

Lastly, the Ionic frieze, glowing with colour and gold in the subdued light reflected from the pavement within the peristyle, starts with its innovation, and carries the spectator insensibly along with it. Running from south to north, it turns the northern corner and continues along the northern side, the movement of its figures ever increasing in speed and vigour, so that the eye scarcely heeds the detached figures of the outer frieze in the irresistible charm of the onward-sweeping orderly tumult, and detail after detail, sought and recognised, goes to complete the graphic picture of the great national act of imperial worship, the Panathenaic procession, with its knights, its elders, young men and maidens, old men and children, all pressing forward and carrying the spectator with them, till, almost as one of themselves, he turns the north-eastern corner and stops before the very door of the holy place. And here again the majestic size of the pedimental group calls back the enchanted eye to gaze upon the divine origin, the Olympian miracle of the birth of Athena from the very head of Zeus; the universal arrests and surpasses the local aspect of the goddess, and the horses of the rising day and sinking night alone can encompass the marvel. The impression deepens in the mind that the tutelary goddess of Athens is great indeed—a goddess of might in all the world, and the eyes, dropping from their reverent contemplation, rest upon the metopes—vigorous sketches in marble of the triumph of the Olympians over the powers of the earth, the giants. The gods indeed are great, and Athena is chief among them.

Once more to the frieze. No longer a stream of living movement, but a peaceful circle of the gods themselves, seated and watching the approach of the great national Attic procession in the honour of her, the noblest and most spiritual of them all. And in their midst a priest, who hands to a little acolyte the folded robe, now to be replaced by that new garment offered to the deity by her loving and grateful people, and once more the intensely loyal aspect of Athena is brought home to him who reads the sculpture aright.

Lastly, the great dim portal greets the eye, and invites entrance to the sanctuary.

Enter. Leave behind you the bright, hard glare of the mid-day sun, trembling on the blue-grey limestones and glittering Pentelic marble. At once you are plunged in the cool golden twilight that filters through the thin marble tiles, and your shadow slides before you on the pavement to melt in the soft haze of diffused light that is almost darkness to your yet unaccustomed eyes.

Look straight before you, and out of the amber gloom there grows slowly the towering form, clad in gold and jewels, partcolor of enamel and cunningly wrought metal, of the very goddess herself—Athena—Athens imperial and incarnate, the spirit of the past, the pride of the present, the hope of the future, whose calm, ivory-white features glimmer ever more clear as her blue eyes gaze steadily out and beyond over her beloved Attica, toward the hill whence the stones of the temple wherein she stands were hewn by her devoted people. It is a climax, superb and supreme, to which the sculptor has led you, insensibly, irresistibly, because the source of his inspiration, and of that of the architect, was one and the same source, because the Parthenon without its sculptures had been a mere shell, dead and meaningless, and because those sculptures, divorced from their surroundings, could lead nowhere, could serve no purpose and tell no story of a nation's passionate devotion.

Like Æsop of old, I must find for my parable a moral. The moral is this—that the purpose of the building must be the inspiration of both architect and sculptor, and that the two must work together to such an extent that the architect shall so design his building as to be incomplete without sculpture, even to the point of sacrificing something of purely architectural effect, while the sculptor for his part shall acknowledge that the mission of his work is to accentuate and enhance the broad strength of the architectural forms, to lead the mind to the contemplation rather of motives than of forms, rather to the spirit of the whole than to the perfection of the part with which he himself is immediately concerned. Mutual forbearance, mutual self-sacrifice and a common interest will, I think, soon relieve our public buildings of the spectacle presented by fair forms of stone clambering along perilous parapets and reclining cumbrously upon giddy gables, of rows of columns obscuring ill-shaped friezes, or officious statues blocking out the daylight from all-too-modest windows. Sculptor and architect must be not rivals but allies, firm knit in loyal service to stern utility, whom they exist but to ennoble and adorn.

WELLS CATHEDRAL.

"WELLS Cathedral: an Idyllic Minster of the West Country," was the subject of a lecture delivered before the St. Paul's Ecclesiological Society at the chapter-house, St. Paul's, on Wednesday, December 12, by Mr. E. W. Harvey Piper, the Rev. Lewis Gilbertson, F.S.A., in the chair.

A young photographer and student, the lecturer suggested, consulted an older friend, asking where he could find a typical English minster charming in grouping, harmonious in proportions and enriched by quaint carving within and without; it should be complete in all its adjuncts of chapter-house and cloister, and enshrined in a setting of inner buildings, gates and towers, with hill-sides, abundant trees and verdant meadows for an outer framework. Such an ideal, idyllic minster, feminine rather than masculine in its characteristics, was to be found at Wells. To the objection that its story was hackneyed the reply was made that only within the last twenty years, thanks to the investigations of Canon Church and the late Rev. J. A. Bennett, had the chronology and evolution of the cathedral been determined and the building of the central mass been correctly assigned to the days of Bishop Reginald de Bohun, 1174-91.

The friends agreed to visit Wells together, and the result of their inspection was thrown on the screen in the form of over one hundred lantern slides. A number of exterior views from various standpoints was followed by an analysis of the distinctive features of the ground plan, the development of the existing buildings being treated in detail. The west front, the widest cathedral façade in England, was eulogised and criticised. It was shown that the feature of the extension of the western towers beyond the outer walls of the north and south nave aisles gave to it its unique breadth, and the front as a framework for statuary was compared with Salisbury, and contrasted with those of Lincoln and Peterborough.

The "forms of saints and kings standing above the cathedral porch" were dealt with in detail, attention being called to the grace, self-restraint and simplicity of treatment which distinguish these, the finest works of English sculptors of the thirteenth century. The carving was contrasted with the figurework of Northern France and that of Winchester, Gloucester and Westminster, typical kings, queens, statesmen, bishops, priests, deacons and knights in chain armour were shown on the screen, and the lecturer suggested the value of those matchless sculptures, fair untouched blossoms still on the branches for which they were conceived, to the student of regal and ecclesiastical costume. A quatrefoil carved six and a half centuries since proved to be Noah labouring as a shipwright. The solemnity and dignity of the nude figures in the Resurrection groups were dilated upon, and the high technique of the anatomy and drapery of the whole series was emphasised. In a rapid survey the lecturer passed round the exterior of the cathedral, visiting the vicars' close, the chapter-house and its undercroft, the cloisters and library. Finally the palace, and following views of the quadrangle and ruined hall a portrait of Thomas Ken was projected on the screen as a reminder of the five years bishopric of that sturdy nonjuror and saintly hymn-writer. In sum-

marising the external treatment, Mr. Harvey Piper contended that nowhere was the ornament overdone; nothing at Wells was too rich or florid, but everything harmonised in a beauty that never became ostentatious or gaudy.

Entering the nave the peculiarities of its construction were referred to. The huge relieving arches at the east end and across the transepts were designed as a structural work of reinforcement, carried out with the consummate skill of a great engineer and the precision of fit of a dentist's set of teeth. The stopping of the vaulting shafts at the string-course over the continuous triforium was shown to contribute greatly to the horizontality of effect, whereby the low pitch of the vault was more than compensated for. The chantries, the eleventh-century font, Peter Lightfoot's clock, and the transepts, their chapels and monuments were described in turn, and a series of illustrations of the quaint and often humorous carvings of the pier capitals was thrown on the screen, including the martyrs to the toothache, the old woman removing a thorn from her foot, the pedlar and his pack, the farmer chasing the fox, the cobbler, and the fate of the fruit stealers told in four acts. A visit to the lady chapel, choir and aisles completed the survey, the author concluding with a description of the desecration of the choir and the defence of the altar by Lord Grey of Wark and Sir Gervase Jerome during the Monmouth rising of July 1685.

HOLYROOD CHAPEL.

WHEN the late Earl of Leven and Melville left 40,000*l.* for putting into repair and restoring the chapel at Holyrood so that it might be used as a chapel for the Order of the Thistle, according to plans prepared by Mr. Thomas Ross, architect, Edinburgh, his Lordship nominated Lord Balcarras and Sir John Stirling-Maxwell, Bart., as his trustees. They now announce that having had a report specially prepared by Professor Lethaby, F.S.A., and after careful consideration, "they find themselves with great regret unable to carry out Lord Leven's generous wishes, and they have intimated to H.M. Office of Works and to Lord Leven's executors their decision not to proceed with the proposed restoration."

The following is a copy of the report:—

Report to Sir John Stirling-Maxwell, Bart., and Lord Balcarras, M.P., by Professor Lethaby, F.S.A.

The Abbey of Holyrood.

In accordance with your instructions, I visited the ruins on October 6, when I met Mr. Oldrieve, His Majesty's principal architect for Scotland, who gave me much assistance and furnished me with exact particulars of the inclination of walls, &c.

The ruin is the nave of the original church, the transepts and all east of them having disappeared. Of this nave with its aisles only the south aisle has retained its vault. This vault rests on the arcade which formed the south side of the nave proper, and on its own south wall. Besides this the outer wall of the north aisle remains, together with a large part of the west front and one of the west towers. To the east, where the nave opened into the transepts, it is now closed by a late wall and east window.

The remaining south arcade of the nave, with the triforium above, is eight bays long; the openings of the triforium have been blocked up with rough masonry. The clerestory has entirely disappeared, so also has the west gable; the upper part of the windows of the latter is work of the time of Charles II.—curious, but interesting.

Most of the existing work is of a very beautiful type of early thirteenth-century architecture; one part of the south aisle wall is Norman, and the wall arcade of the north aisle is of late Transitional character. The west front is an elaborate piece of thirteenth-century work, the west door being especially remarkable. After the splendid south doorway at Lincoln Cathedral, it must be the noblest thirteenth-century doorway in Great Britain.

The present level of the area of the nave is about 1 foot 6 inches above that of the original floor. This is shown by the bench under the wall-arcade of the aisles, which is now nearly level with the ground. The external ground is nearly level with the heightened area. This area is now largely occupied by graves; the two eastern bays of the vaulted aisle are filled by the royal vault and the Roxburgh aisle.

The walls and arches which remain are much decayed by the weather and disintegrated by the action of smoke deposits. Corrosion from the latter cause has been very great, and the surface is everywhere attacked and blackened.

The carved capitals of the south arcade are mostly shapeless masses so far as the detail of the carving is concerned. At some time the pillars of the south arcade have been very largely patched with cement, across which joints have been neatly struck. The pillars consequently seem to be in a far better state than they are in fact—see especially the second and third pillars from the east where some of the cement has fallen away. The triforium stage is in still worse condition, although, like the whole ruin, very carefully kept so far as its state allows. The last three bays to the east are formless in respect of mouldings and details, most of the shafts being just kept in place by metal bands.

Throughout the string mouldings and bases are to a large extent broken, and the shafts of the arcade and windows lost.

Most of the existing work is in various degrees out of the vertical, and some parts seriously so; thus the south wall of the nave, containing the triforium, leans inward from the third pillar to the fifth (counting from the east) from 14 inches over the former to 11 inches over the latter. The west wall with the tower leans to the west $4\frac{1}{2}$ inches, and the tower also inclines to the north 7 inches. The external wall of the north aisle leans out 4 inches at the middle, the south aisle wall also leans outwards, and the east gable leans out 5 inches.

I am of opinion that it would be impossible to restore the ruin for use as a modern chapel without the ancient architecture almost completely disappearing in the process. The present decayed and leaning wall of the nave should not be loaded with a new clerestory and roof, to say nothing of a stone vault. To take it down and rebuild it would be impossible—so much would break up into powder in handling, so large a proportion of decayed stone, especially about the joints, would have to be cut away, so much would have to be discarded when once out of place as too shapeless and unsound.

I am of opinion that an attempt either to add to the ruin without rebuilding it or to rebuild it would be disastrous to it as a great historical monument, and I cannot but earnestly recommend that no such scheme be entered on.

The parts now remaining are but a small portion of the complete nave; the form of the clerestory and the west gable are unknown. The north door has decayed out of all definite form, the west front is greatly perished and has been largely patched up with cement. In the exquisite west door only about one-quarter of the fine carving of the mouldings remains, and the carving of one of the four arch-orders has entirely disappeared.

The problem of making a modern building out of an ancient ruin is so large and serious that other aspects than that of preserving the ancient fragments should be mentioned. There is the problem of making anew lost parts for which there is no sufficient evidence, such as the clerestory, the west gable, &c. There, furthermore, is the question as to what is to be done with work which might be called late and debased, such as the present east end, the Caroline repairs to the west front, and the late wall monuments of the interior.

Then we must consider the magnitude and various forms of necessary modern work—the new stonework, copied and conjectured, the wholly new ceilings or vaults, paving, glazing, woodwork, artificial lighting, &c. What is old would largely disappear in handling it, and that in turn would be swamped by entirely modern work.

The question of cost is one which I had not the opportunity of considering with precise information before me; but bearing in mind that much of the existing stonework would have to be taken down, and that it would be impossible to use most of it over again, the adequacy of the sum of 40,000*l.* for the purpose of rebuilding is a subject to which I must draw your careful attention, if you were to consider such rebuilding possible. The ruined nave is about 140 feet long, including the west front, 70 feet wide over the walls, the crown of the ancient vaulting must have been about 62 feet above the pavement, and the apex of the roof and end gables some 24 feet more.—I have the honour to remain, yours faithfully,

(Signed) W. R. LETHABY.

111 Inverness Terrace, London, W. :

October 11, 1906.

The Edinburgh Corporation have unanimously agreed to take no action in connection with the motion as to the desirability of forming a promenade on the south side of Princes Street.

NOTES AND COMMENTS.

THERE are some people who unconsciously are seeking after the ideal, and in order to attain it would gladly see the world and all its business topsy-turvy. For such aspirants the metric system is a subject which affords abundant occupation. It may as well be admitted that ten is an easier multiplier or divisor than sixteen or twelve, and in a great many cases the metric system is employed in this country without causing inconvenience to anybody. For railway and other large surveys the 100-foot chain has been substituted for the standard 66-foot chain, and operations have been facilitated by the change. The Ordnance Survey has likewise adopted plans for towns on a scale of 1 in 500. But that is different to applying the metric system for general business purposes in this country. A paper was read last week before the Society of Arts by Colonel Sir C. M. WATSON, a Royal Engineer, in which the disadvantages of the metric system were explained. The yard is the standard in Great Britain and the United States, with their dependencies, and is therefore used by 489 millions of people. The population of the countries in which the metre is used may be taken as 327 millions. It may therefore be said that 50 per cent. more people favour the English system. Sir DAVID GILL, who was present, said the metric system was originally set up in a hurried and imperfect manner by people who were only anxious to revolutionise everything. The original metric system is not the metric system of the scientific world of the present day. It is remarkable that Lord BELHAVEN and STENTON, who introduced a Bill in 1904 for the compulsory adoption of the metric system, said that the advocates of the measure were promised the support of 400 members of the House of Commons in the present Parliament whenever a Bill was introduced.

WHEN we consider the numerous interests it serves, the French budget relating to the fine arts and amounting to about 17,500,000 francs, or say 700,000*l.*, is not excessive. Operas and theatres require the greater part. There are also the public factories at Sèvres and of the Gobelins to be kept up as well as the Academy at Rome. But building has not received much encouragement. A school of decorative art has been neglected and can no longer be delayed. The Conservatoire is no longer adapted for 700 students in all branches of music, singing and declamation. And a school for furniture in the border city of Nancy is to be undertaken without delay. The vast number of officials of low ranks connected with the fine arts are also clamouring for increased allowances; and indeed it has been suggested that the recent robberies in the Louvre were merely hints of what could be done if justice were delayed. The whole of the report is suggestive of the fact that, for anyone who can see behind the scenes in all the departments connected with the fine arts, there is disaffection which does not augur well for the future.

THE organisation of the Panama Canal has been arranged in a manner which is calculated to promote efficiency. There is to be a Commission, and it will come under the supervision of the Secretary for War—although why a work of that kind should be considered as warlike is not evident. Then there is to be an executive committee, consisting of a chairman, and the chief engineer, general counsel, chief sanitary officer, general purchasing officer, general auditor, disbursing officer, and manager of labour and quarters. The chairmanship is to be no honorary office, for the holder will have charge of all departments, and in the absence of other great officers shall take their place. The chief engineer is to have charge of all work relating to the canal or on the isthmus, as well as the Panama Railway; he is to have the custody of the supplies and

plant. All legal matters belong to the general counsel as well as the administration of civil government. The sanitary officer will deal with all sanitary matters within the zone of the canal, the cities of Panama and Colon, harbours, &c. He will have also the custody of all medical supplies. The purchasing officer will acquire and deliver supplies, machinery and plant. The auditor will have charge of the book-keeping, the accounts relating to property, statistics, auditing, &c. The preparation of pay-rolls and the distribution of wages and salaries will be the duty of the disbursing officer. The manager of labour and quarters is to have charge of arrangements concerning labour from the West India Islands or Central and South American countries, the general personal records of all employes, and shall assign quarters to all employes of the Commission or its contractors, and will be responsible for the operation of all Commission hotels and mess-houses. By the arrangement each high official will have his own special duties, and there can be few doubts concerning the department which should undertake any kind of work which had not been anticipated.

WHEN schools of art and university colleges were established in provincial towns it was generally assumed by the promoters that local industries were to have the benefit of the acquired knowledge and skill of the students. Experience has shown that the expectation was an illusion, for the students sought other fields for the exercise of their ability. The latest instance is presented by Nottingham. The Chamber of Commerce appointed a special committee to investigate the causes which prevented the School of Art from aiding the local lace curtain and embroidery trades. It may be supposed that the staple industry of Nottingham should have the first consideration. And, indeed, the claim was originally recognised. It is true that designs for lace are produced in the school, but somehow the manufacturers ignore them, and the excuse given in some cases has been that the designs were not adapted to the machines employed in the factories. The committee seem to be of opinion that there cannot be an improvement until an expert instructor is engaged. The theory on which both art schools and technical colleges are inspired is that the student must in the first place go through a wide range before he takes up any branch of art, and especially industrial art. But in the majority of cases the effect of the studies is to make students consider themselves as made superior by their talents and training to the humble work of producing trade designs. They are not to be blamed in all cases, for many manufacturers appear to think that a design of the kind is only worth a very small price. If local manufacturers would realise modern conditions and offer adequate rewards to young artists, then we might expect to see specialists created who will be at least equal to the designers of France and Germany.

THE report of the Commissioners of Public Works in Ireland shows the extent of the efforts to improve the dwellings of the labouring classes in the country and towns. Between 1866 and 1885 the amount expended was 281,334*l.*, and 3,416 dwellings were erected. During the past year six applications were received, amounting to 46,714*l.* It is remarkable that two were from public companies or private individuals, and the amount sanctioned was 40,675*l.* This fact is evidence that others besides district councils are taking interest in the improvement of dwellings. In the forty years between 1866 and 1906 the amount of the loans sanctioned was 1,120,867*l.*, and it enabled accommodation to be provided for 10,971 families. In addition, the large sum of 3,468,201*l.* was advanced since 1884 under the Labourers Act. A sum of 243,358*l.* was expended on residences for teachers in National schools.

ILLUSTRATIONS.

NO. 5 CHEAPSIDE.

THE block of buildings erected at corner of Cheapside and Paternoster Row constitute the head offices for Great Britain and Ireland of the National Mutual Life Association of Australasia, Ltd. The material employed in the construction of the lower storeys is axed grey granite from Cornwall, the rest of the superstructure being executed in Portland stone and the whole being enriched with carving. The window sashes, frames and doors of the lower storeys have been executed in Austrian fumed oak, the frames of the upper windows being steel casements. The basement windows are protected by wrought-iron grilles, and the entrance doorway is marked by a wrought-iron fanlight bearing the Association's name in gold letters. The interior of the ground floor contains the public offices of the Association, the whole of the counters, framing and fittings therein having been carried out in selected Austrian fumed oak. The public lobby is floored with marble mosaic, founded upon a design brought from Egypt by the manager of the Association, Mr. J. B. GILLISON. The whole of the walls of the public offices are lined with marbles, the plinths being in hamachelle, the dado panels in jaune jaspe, the strings and rails in rose du var, while the main filling of the walls is in white Sicilian, relieved by vert des alp columns, the frieze being treated in carton-pierré. The ceiling is panelled, and from the centres of the panels descend electroliers of Florentine bronze, supporting large cut-glass cups in which lamps are grouped. The ground floor comprises, besides the public offices and vestibule, the accountant's room, general clerks' office, cashier's office and inquiry office, together with telephone box, strong-room and motor-room for lift. The basement contains the chief inspector's office, the sub-inspector's office, a typists' room, copying-room, extensive strong-room, lavatory accommodation, boiler-room and heating apparatus. The first floor comprises board-room and manager's room, medical officer's room, auditors' room, typists' room, strong-room and waiting-room. This floor is approached by a teak staircase enclosed by a wrought-iron balustrade. The whole of the partitions and appointments to this floor are carried out in Austrian fumed oak of selected material and special design, and the dados of the walls are richly panelled in similar material, the upper portions of the walls being hung with gold canvas. The second, third, fourth and fifth floors are arranged for general office purposes, with their own group of lavatories, each floor having the additional advantage of a strong-room. The upper floors are approached by a separate staircase and an electric lift. The electric lift is automatic, and enables any person having business with the upper storeys to carry himself to any of those storeys by the mere pressing of a button. The lift is enclosed in a wrought-iron grille, the cage being executed in oak. The whole building is heated by radiators, and there is a complete system for the introduction of fresh warmed air and the mechanical extraction of foul air. The building is lighted throughout by electricity, and it is fitted with electric domestic telephones, enabling complete intercommunication to the different departments. The whole of the internal metalwork has been executed in Florentine bronze. The general contractors for the main building were Messrs. J. WHITEHEAD & CO., LTD. The general contractors for the completion of the building were Messrs. SIMPSON & SONS. The granite, marble lining and mosaicwork were executed by Messrs. FENNING & CO. The heating and ventilating were carried out by Messrs. W. G. BURROUGHS & SONS. The electric lift was carried out by Messrs. WAYGOOD & CO., LTD. The electric light was installed by Mr. J. E. AUSTIN. The whole of the works have been carried out from the drawings and under the superintendence of the architect, Mr. DELISSA JOSEPH, F.R.I.B.A.

THE KING'S ARMS INN, THORNFORD—VIEW IN BAR TOWARDS INGLE.

THIS building has been erected for the Dorset Public-House Trust Company at Thornford, a large village about $3\frac{1}{2}$ miles from Sherborne, and is one of the 210 houses in the United Kingdom in which Earl GREY's scheme of public-house reform is being carried on by the thirty-eight county trust companies that have been formed for that purpose. Simplicity of design and homely comfort, with such a disposition of the rooms and the entrances as will enable the manager to exercise complete control and supervision over all parts, are essential features of all Trust houses. The accommodation provided on the ground-floor consists of a large general room, 16 feet by 25 feet, with bar and inglenook; parlour, 12 feet 6 inches by 15 feet, for the better class of customer; and a tea-room of the same size, with kitchen and usual offices conveniently arranged. On the first floor there are five bedrooms, of which two are set apart for visitors. There is a large cellar under the ground-floor. The walls have been built hollow, the lower part faced with red Somerset bricks, the upper part finished with rough-cast with half-timber gables, the roofs being covered with Bridgewater tiles. The contractor was Mr. W. W. HAYWARD, of Longburton, near Sherborne, and the architect, Mr. J. DOUGLAS SCOTT, A.R.I.B.A., of 23 Bedford Row, London, W.C.

SLEEKBURN CHURCH.

THIS church has been recently built and opened in the colliery village close to Bedlington station, in Northumberland. The church has been built at the small cost of 3,761*l.*, including boundaries, vestries, heating and font. It is faced with Bedlington Colliery Company's bricks, with stone dressings. A further sum was given by a private donor for painted east window, chancel fittings, reredos, pulpit, organ case, lectern, and mosaic pavement and marble steps for the chancel. The whole work was carried out from the designs of the diocesan architect, Mr. ARTHUR B. PLUMMER, F.R.I.B.A., of Newcastle.

CHEVINGTON PAROCHIAL HALL.

THIS parish hall is being built in Chevington parish, in the colliery village of Broomhill. It is being faced with bricks manufactured by Messrs. LOWRY, of Newcastle, being their best red-pressed facing bricks. The roof is being covered with green slates. The contract for building was let in the earlier part of this year to Mr. BROWN, builder, of Amble, Northumberland. The building is designed by the diocesan architect, Mr. ARTHUR B. PLUMMER, F.R.I.B.A., of Newcastle-on-Tyne.

CATHEDRAL SERIES.—MANCHESTER: THE NAVE, EASTWARDS.

ROCHESTER CATHEDRAL.

THE cathedral, it is announced, is insured in two offices in equal moieties for 39,700*l.*, apportioned between the fabric and the fittings. In March 1905 the Chapter took the amount insured into their consideration, raising the insurance on the fabric and that on the organ. In the same year they dealt with the question of fire appliances, purchasing new fire hose and fittings under the advice of the captain of the local fire brigade, and placing these appliances under the care of the brigade's superintendent of apparatus, who is to inspect them periodically and to be responsible for their efficient condition. Fire extinguishers have been placed near the chapter-house door, near one entrance to the roof and in the ringing chamber. It is not considered that any risk attaches to the part of the crypt used for the hydraulic organ engines, and there is a strict injunction that no naked light be taken into the interior of the organ. The vergers understand the mechanism of the appliances, and are instructed as to the steps to be taken in case of an alarm.

ROYAL HIBERNIAN ACADEMY.

THE following is an extract from the evidence of Sir Thomas Drew, LL.D., F.R.I.B.A., president of the Royal Hibernian Academy, before the committee of inquiry into the work carried on by the Royal Hibernian Academy and the Metropolitan School of Art, Dublin:—

The Chairman (Lord Windsor): You are President of the Royal Hibernian Academy of Arts?—Yes.

It is a fact, is it not, that you were an Associate in 1867?—Yes.

And an Academician in 1872?—Yes.

And President since what year?—Since 1900.

Perhaps it would be more convenient now to ask you to make any statement that you wish to submit with regard to the Royal Hibernian Academy and its position at the present moment?—I suppose that includes its history?

The Royal Hibernian Academy of Painters, Sculptors, Architects and Engravers was founded in 1823 under a Royal charter of George III.

The Academy received a supplementary charter in 1861. It has withdrawn now from seeking for any other charter as stated in earlier communications to His Majesty's Government. The origin of the Academy was in the desire to imitate the association of Independent British Artists in London, in a Royal Academy founded about 1760 with certain functions of usefulness to contemporary art, and which was favoured and endowed with gifts from the privy purse of King George IV. The functions of the Royal Hibernian Academy were similar to those of the Royal Academy, and they were exactly analogous to those of the Royal Scottish Academy, which was founded later, and they may be defined in terms borrowed from the definition of functions and status of the latter institution given by a Treasury minute of February 25, 1858, adapted to the Irish case, namely, "(1) The giving to the Royal Hibernian Academy, which must be considered as the representative of the artists of Ireland, its due position in reference to the promotion and teaching of the fine arts. (2) The securing to the inhabitants of Dublin, by the annual exhibitions of modern art, opportunities, which cannot be over-estimated, of rational amusement, mental cultivation and refinement of taste."

With regard to endowment, the Royal Hibernian Academy derived its first establishment and buildings from a private citizen of Dublin, Francis Johnston, architect, in 1826, and from his wife Anne in 1830. The value of the premises is about 7,000*l*. Her Majesty's Government, through the Irish Board of Works, defrayed the cost of a new roof for the greater gallery about 1872. The cost, I believe, was 403*l*. Sir Thomas Jones, a former president of the Academy, added a schoolroom for study of the life model at his own cost, with other improvements to the value of 1,000*l*. A Prince Consort Memorial (Albert) Fund, amounting to about 1,200*l*, was, by gracious will of Her late Majesty, apportioned to the Academy. Its interest is applied at present in medals and prizes for students.

The Academy possesses a small library and collection of prints, some diploma and other pictures acquired by gifts, or bequests, or purchase, among which are some fine works by Giordano and Bassano, little known. The Academy has had since 1832 public recognition in an annual grant of 300*l*. voted by Parliament as its sole financial support outside the endowments above mentioned. It has during eighty years devoted most of that small aid to the maintenance of a life school for young artists, which the members of the Academy voluntarily established by resolution in 1826. It is not under the terms of the Charter. It is but an adjunct to the primary purpose of the incorporation, and is dependent on the voluntary services of the members as visitors and teachers.

The Academy has strenuously fulfilled its duty under its Charter with the quite inadequate grant of 300*l*. a year for eighty years, and with increasing excellence, while there has been a good deal of public spirit on the part of the members in keeping up such exhibitions when its financial resources were gradually decreasing. During the last few years both the annual and the winter exhibitions have been very creditably maintained. They have aroused great interest in Dublin, and have in great measure stimulated the movement which led to this commission. The Academy has suffered vicissitudes and interruptions in its work during its existence, notably such as the state of Ireland following the great famine of 1847-8, when, for a number of years, interest in art was set aside, and patronage of it was slowly recovered. About 1875 the Academy was still fairly prosperous, but

the change had already begun of the whole district north of the Liffey, of which Sackville Street is the principal centre, through the desertion of it by the entire residential well-to-do class year by year, until street after street became occupied by second or third-rate business and tenement houses, which are even now invading the once fashionable squares. The entire population of a new Dublin which is of importance to the Academy, to a number perhaps of 250,000, is grouped in streets and suburbs around South Dublin, and the people are for the most part not interested in, and resort but little to, the north side of the river. The Academy situated as it now is, in what is an obscure byway and in decaying buildings, could no more hope to carry on its functions prosperously and usefully for Dublin than if it were in some other city. It is especially injurious to it that it is excluded from those centres of art and science which, with the most fortunate results, have been comprehensively grouped around Leinster House. It is still a puzzle why, and under what influence, modern and contemporary art, so essential to the round of art culture, was, without any explanation, dropped from the otherwise splendid scheme under which the establishment of art and science around Leinster House was conceived between 1860 and 1870. It is in the opinion of most Dublin people a grave imperfection in this intended circle of intellectual culture that modern contemporary art has not yet its place. A site and exhibition buildings in this essential centre is, after all, the primary necessity of the Academy, and to this, considering the public benefactions to the other Royal Academies of London and Edinburgh, the Academy and the Irish public consider that the Hibernian Academy has claims. The provision of buildings, for which it has claims on public subsidy, is but after all a secondary difficulty. It looks but for galleries in an inexpensive sort of building, and of no more extent than its present modest buildings, standing on a site inclusive of its offices of from 7,500 to 8,000 superficial feet, and in its galleries giving 750 fee lineal of wall for hanging pictures on.

The Academy allows me to say that it is as willing as ever to continue a school free to young artists as supplementary to the work of the Department of Agriculture as that Department, I believe, desires. The Academy has perfect confidence that with moderate improvements in its locality and financial resources it can make its business self-supporting and a useful influence. It is not the idea of practical-minded members of the Academy that it should be housed in costly buildings, which would stand in useless dignity during months in each year when no exhibition is on. The Academy, having primarily provided for its own wants without embarrassments, would desire to exercise its discretion in letting its galleries for other purposes cognate to the arts, for which accommodation there is an existing want.

The necessity for a new Charter asked for by the Academy through the late Lord Lieutenant, Earl Cadogan, need not now be pressed. Through the personal intervention of his successor, Earl Dudley, the power of framing by-laws under the Charter, with the approval of His Excellency the Lord Lieutenant, has been put in force so as to materially modify some previous disabilities. Its modest claims now are, first, a site and new galleries for its exhibition of modern and contemporary art in the vicinity of Leinster House; second, that the small fund realisable out of the past private endowments of the Academy should remain vested in it; and, lastly, that it should retain its autonomy and reasonable independence under which alone, with many difficulties, its members disinterestedly have been able to discharge the Academy's duty to the Irish public for eighty years, and which constitutes the essence of vitality of every academy of fine arts.

The figures will show that through a series of years, even with the most diligent and prudent management, and even when it has been able to devote only a limited sum each year to the upkeep of its decaying buildings, the Academy has a small deficit of income against expenditure. This could but result, under present conditions, in a lingering dissolution, under which the advantages of study of modern contemporary art would be literally lost to Ireland, a culture which is not absent, under State encouragement, in any country, state or province of civilised Europe known to members of the Hibernian Academy.

The Chairman: Could you tell us what is the number of Academicians and Associates?—The number is thirty Academicians and ten Associates. That has been one of our difficulties. I should explain to you that the Charter of 1861—I know from personal recollection, having had some-

thing to say to it—enlarged the membership from fourteen to thirty. The intention was that there should be room to include artists of Irish birth or connection, not necessarily resident in Dublin, and Daniel Maclise, R.A., John Foley, R.A., and Francis Danby were nominated in the Charter of 1861 as constituent members, representative of this class. At the foundation of the Academy, some such good men as Westmacott (sculptor), R.A., Rossi, R.A., and Sir Martin Shee, P.R.A., as honorary members, represented a like class. However, the working of the by-laws attached to the Charter made the continuance of this impracticable, imposing, as it did, conditions which made it practically impossible to elect such members in London. We have now somewhat improved that, but our by-laws still represent an awkward process. Yet it is possible for us now occasionally to elect an artist resident in London, leaving the resident artists at a number sufficient to carry on the work of the Academy here.

So you are relieved to a certain extent?—Yes. We would very much prefer that we had the Scottish arrangement of an unlimited Associate list which our Charter will not allow. We have a congested list of ten Associates, from which we must elect, and that list must be filled up before we proceed to elect a member.

Mr. Justice Madden: Then there would be some need of a supplemental Charter?—On that point there is a decided need.

Mr. Boland: You have at present no power under the by-laws to remedy this disadvantage of which you speak?—No. The Charter prevents us from altering our fundamental constitution. I should add that the number of members fixed at thirty is quite too large for all the artists to be drawn from Ireland.

You desire an alteration of the Charter in that particular?—I think the old number of fourteen Irish resident members was quite commensurate with Irish wants.

The Chairman: Are you obliged to fill up the number of thirty?—Practically we are. Under our old by-laws we should do so within three months. It causes great awkwardness. Now we have some delay allowed us.

Would you tell us how many of them are painters, sculptors and architects?—Out of the number of Academicians five are architects at the present time, two are sculptors and the balance are painters.

You stated in your evidence that the Academy has withdrawn from seeking for a new Charter because, as I understand, they have power given to them to make by-laws?—Yes.

But you modify this now?—Yes, in respect to elections.

Mr. Justice Madden: That is only a makeshift?—Yes.

Why not have a new Charter regularising the whole position?—It would certainly be more satisfactory, and a new Charter might be more practical.

Mr. Boland: But your principal desire is to show the necessity for the new site, and though the Charter would be a very great advantage, you do not lay very great emphasis on it?—No, I do not make it fundamental. A new site, and to have some more income available, is what the Academy wants.

The Chairman: As to this new site, I should like to ask a little more in detail; in your opinion the present site is not a suitable one?—I think it is utterly untenable any longer. As well as the decay of the building year after year, it is becoming more obscured.

Is it not the fact that the Royal Hibernian Academy must maintain the building?—It has no option but to maintain it. I suppose it would be open to us to let the building go to ruin if we liked, but as the owners of the premises we are obliged to maintain them.

Have you found it impossible to spend the necessary money on maintenance?—Yes; we can do only quite trifling repairs of the most absolutely necessary kind.

Mr. Justice Madden: You have only got 50*l.* a year towards that?—Yes, and a good many of the repairs have been done gratuitously for years. For instance, we lent the Academy to the Society of Decorators, and as a little compliment, they repaired the place for us.

The Chairman: Do you attribute this mainly to the fact that the present building is situated on so unsuitable a site?—I do; and I have reason to speak, for I am very intimately acquainted with that side of Dublin for fifty years, and the change, especially on that side of Dublin, has perhaps nothing to equal it in any other city. It has turned Dublin into two separate cities.

Mr. Holmes: Regard being had to the fact that the population has deserted even this part of Dublin (the

neighbourhood of Leinster House), do you think the transference of the site over here would bring any material increase in the number of visitors?—I feel very confident about it. From my observation I think the establishment of the National Gallery here has been a decided success. As a centre it is resorted to. The people come there.

Mr. Justice Madden: There is a unique collection of Celtic gold ornaments and other things in the museum which people go to see, and when going to or coming from the museum they might look in at the Academy exhibition if it were adjoining?—Yes.

I believe the position of the Tate Gallery in London has told unfavourably on the attendance there?—I believe it has. The Tate Gallery attendance is largely made up of Americans and tourists who would make a point of seeing it wherever it is.

The Chairman: You have to look mainly to the support of the public in visiting your exhibition?—Absolutely. What I may call our gate money is our only income apart from the grant, and our expenses in bringing pictures from London to keep up a creditable exhibition, and sending them back again, is exceedingly heavy. We are at a great disadvantage in that.

Mr. Holmes: Have you ever attempted to increase the attendance by opening the gallery in the evenings at reduced prices?—We always do. We open at 2*d.* in the evening, and the place is well filled with working people, and we open on Sundays.

What do you charge for admission?—We charge 2*d.* or 3*d.* on a Sunday and 2*d.* in the evening, and both openings are well attended, and great interest is taken in the pictures, and there is quite a profit on the sale of catalogues to the working classes.

The Chairman: I should like to ask you as regards the other branch of your work, is it, in your opinion, detrimental to the teaching of the Academy students that they should have to come to this particular site?—I would not say that, because the students who mean to be artists are very limited in number, and they will go anywhere to get teaching. What they want is to be in touch with practical artists, and, like the French system, to learn their technique from good artists. They will go for that wherever it is.

So what is important in that respect is to get a suitable building and suitable rooms for teaching?—That is the sole requirement. We are at a disadvantage. We feel it a duty to make probationers coming into the school show that they are able to draw from the antique, and we are at a great disadvantage in not having sufficient room for school purposes, and when they say, "Where can we draw from the antique?" we cannot supply them. Before the rebuilding of the National Gallery the sculpture hall there was a good hall for study, but owing to the exigencies of the new building, the lighting has been changed, and it is not so good for study now. There is always a difficulty about teaching drawing from the antique for want of room.

How do you test those who apply?—Lately they send in drawings and sometimes they do work in a special class, and we see ourselves that they do work from the antique. When we get drawings sent in we find it necessary to look closely into them to see if they are genuine and done by the student himself, and sometimes he is put to work so that we may satisfy ourselves that it has not been brought from some other school. We take great pains to insure that there should not be any imposition of that kind.

Mr. Holmes: Are the teachers of the school themselves, or some of them, Academicians?—Yes. There are four visitors appointed annually. They get a very small fee for it.

They are practically unremunerated?—It is a very small thing. A mere honorarium of 10*s.* a visit.

I suppose that funds don't permit of paid teachers?—It would not be desirable to have paid teachers. Students would rather be taught by artists whose names they know.

Do you consider the teaching capable as it is now?—I think it is very good, and we could extend it. We could have a better school of painting, and we would have members taking a great interest in it.

Do you find the capacity of the visitors who teach varies very much: are some of them better endowed as teachers than others?—Some are more popular, especially with ladies; others are less popular, who may be more exacting.

On what principle are they selected?—Generally at our annual election we vote for the men that we consider make the best visitors, and it is regulated by the majority.

Do they take so much of the year each?—They get 10*s.*

fee for each attendance. If a man attends five times in a week it would be 2*l.* 10*s.*, and if he attended four times it would be 2*l.* for three or four months.

How long would he attend?—I should think about two or three hours—the ordinary time of a student.

The Chairman: Does he teach continuously?—He criticises more.

Does he leave it to another visitor or does he drop in when he can?—Whichever visitor comes on, if it is the same model that they have been drawing from; he acts more as a critic. He finds fault with careless drawing or anything of that kind. You cannot exactly drill or discipline students of the Academy as you would in a school. It is by influence more.

The object of my question was rather to find out whether there was continuity. It seems to me that a student would gain more by having continuous criticism from one artist for a certain time than he would by having various artists coming in to criticise, but is it your practice to have the visitors come in and out in such a manner as to make it continuous?—Yes. There never has been any disadvantage through want of continuity.

Mr. Holmes: Do you exact any preliminary test from the students before they come, such as having to pass certain examinations?—Yes. The tests will be found in the rules here. (*Rules produced.*) They are pretty wide. In fact, they are identical with those of the Scottish Academy. It amounts to this—the students must send in a drawing from the antique done by themselves, or they must send in a series of works which show sufficient knowledge of drawing, and a little committee always sits upon what is sent in and investigates the drawings, and when the case is at all doubtful the candidate is taken into probation for a week or two, and that is the real test. The visitors watch him.

Do you ever find it necessary to reject candidates?—Yes, many very young persons, and people without the necessary previous training.

Where would they get that preliminary training?—Most of them from the Metropolitan School of Art here, some from private study, and there are some who present themselves without any qualifications or knowledge whatever, and are, of course, rejected.

I believe some two or three years ago Sir William Abney reported in favour of amalgamating the Metropolitan School with your school; do you think that is a desirable or an objectionable course?—We do not attach a great deal of weight to that, it seemed to involve so little in the matter of money. But the feeling of artists here is that students, when they come to the artist stage, require a kind of life school which is different from the kind of life school which suits a preliminary school such as the Metropolitan School of Art.

ART IN IRELAND.

ONE of the witnesses before the committee of inquiry into the work of the Royal Hibernian Academy and the Metropolitan School of Art, Dublin, was Mr. George Moore, the novelist. He has made a study of art and published a book on modern paintings. His evidence was in keeping with his articles and criticisms which have appeared from time to time:—

The Chairman (Lord Windsor): I believe I am right in saying that you have given a good deal of attention to art matters for some years past, and that you have been good enough to come here to answer any question in reference to them, and to give us your views?—Yes.

I believe you have made yourself acquainted with the working of the Metropolitan School of Art in Dublin?—Yes.

I would like to ask you your views upon the teaching, as compared with your experience, of the Academy schools?—If I might offer a suggestion, perhaps—

Yes?—Well, I would suggest, before going into details, I might give my views on the subject of your inquiry generally.

The Chairman: Yes—exactly as you please.

Witness: It seems to me that the first thing you have to do is to find out whether art can be encouraged or repressed; whether it is a thing of spontaneous growth or a thing that is produced like an orchid in a hothouse. Of course you can build art schools and picture galleries, and the newspapers will admire you for it, but will you help struggling talent? I should like you to inquire into the origin of art, and, facing the question boldly, I should like

you to ask yourselves if you really believe that the cause of art can be advanced by collecting pictures and presenting them to the nation; by collecting old furniture, &c.? Everything nowadays—shoes, medals, walking-sticks—every rubbish is collected, and the proud possessor generally insists that the nation shall build a gallery to house his treasures. It is generally assumed that art is being neglected if the industrious collector is not provided with an immortality in the shape of 30 or 40 feet of gallery. We find that art comes suddenly and swiftly, and that nobody has any clue as to how it comes. Take, for instance, what happened in Italy in the fifteenth century. Did not art appear spontaneously, like the spring? The social conditions were not more orderly than they had been before. There were no art schools nor museums; but art began again. Italy to-day has an excellent system of government; Italy is united; it has a perfect system of finance; but there is nobody in Italy to-day who can model a nose with even tolerable decorum. If you turn to Italy of the fifteenth or sixteenth century you find that Italy was at war; that every town was against its neighbour; that anarchy prevailed everywhere. There were assassinations and immorality that have hardly been equalled. Take Holland in the seventeenth century. Holland was then engaged in driving the Spaniards out, and to do so they did not hesitate to break down the sea-banks. The Catholics escaped as best they could, and the Dutchmen began to paint pictures—why, none can say—inventing an art all their own, unlike Greek or Roman art, choosing domestic scenes by preference. Why? No answer. . . . There were no art schools, no museums. The State did not encourage art; nevertheless there was art.

The Chairman: Do you suggest that art schools are of no use whatever?—I doubt their utility. If you look into the history of art you will find that all the art the world values was produced when there were no State-endowed schools.

Mr. Justice Madden: Your remarks are true of literature also, still we teach people to read and write?—You can assume that art schools are necessary, that museums are necessary, but there is no proof that they are.

At the time you mentioned the system of apprenticeship existed to a great extent, and that was what a school is—it was a kind of schooling?—Yes, a kind of schooling, whatever that may mean, no doubt; but the question before the committee is whether art can be encouraged or repressed. I believe that neither the one nor the other is possible. Mr. Whistler has some excellent remarks on this subject in his book, "The Gentle Art of Making Enemies." I wish I could quote the text. He calls attention to the fact that the admirable moral qualities of the Swiss have not helped them to realise any artistic aspirations. Every gap in their mountains yawns with noble legend, but the Swiss are left, he says, with the cuckoo clock, and the cuckoo with difficulty restrained in his box. Was it for this that Tell was a hero? Was it for this that Gessler died? But the jade hies to Nankin, and, sitting by an opium-eating Chinaman, inspires him to decorate a plate with little ladies, that the world loves. My memory fails me, but you will find the passage I mean in the "Ten o'Clock." Mr. Whistler was of opinion that art cannot be encouraged or repressed. If there is any country in the world that does not need art schools, I should say that that country is Ireland. It is dangerous to prophesy; the future is always hidden; but if anything seems sure, it is that the immediate future of Ireland is not art. Whatever education and culture there is in the country is leaving it. Ireland will soon be given up wholly to small farmers. Out of these, no doubt, an aristocracy will emerge eventually—hundreds of years hence. Meanwhile Ireland will have little need of art schools. The National Gallery is proof of the little interest Ireland takes in art. The National Gallery is the most perfect image of the Sahara I know. Now and then one sees a human being hurry by like a Bedouin on the horizon. True that the pictures that are bought for the gallery are generally worthless. Sometimes the pictures are ridiculous forgeries; sometimes the pictures are merely furniture pictures. They are nearly always without artistic interest. I speak of the pictures bought within the last ten years; 1,000*l.* a year is wasted, and nobody cares. That is what depresses me—nobody cares. And I sometimes ask myself if the genuineness of the pictures matters. There are not three men in Dublin of independent income who live in Dublin by choice. How can I expect Sir Walter Armstrong to give much attention to his gallery? No one goes there, except when it rains.

Ireland is given over to officials, graziers and priests. A few years ago 250*l.* was paid for a picture said to be by Lorenzo di Credi. Well, it isn't; it is an indifferent copy, but what does it matter?

Mr. Holmes: What do you suggest that we should do?—I think a certain sum of money should be granted to the Academy. The Irish Academicians may not be good artists, but artists they are, and when Ireland loses its Academicians it will have sunk deeper in the morass. They are miserably poor, but they are artists. Bring on better artists to Dublin if you can. Try to get artists to paint in Ireland. Example is better than teaching. No one learns anything he did not know before.

The Chairman: This committee has nothing to do with any inquiry into the National Gallery. Witness: I know that. I would, however, throw a little light on the general artistic outlook. However bad these artists are, they are better than none.

Mr. Holmes: You mean that it would be better to spend money on the Academy School than on pictures?—I think so.

Mr. Justice Madden: The important part of your argument is that, if you are to have a school, it should be under artists?—Yes, I think so.

And not under a department instituted for agriculture and technical education—a department of an industrial character—that's your point?—That is so. I once visited this Metropolitan School of Art, which costs 4,000*l.* a year. Mr. Orpen was there, and he came forward laughing. There were a number of people there, fifty or sixty, and I said, "Mr. Orpen, what are these people doing here—they are not admitted free, are they?" He said, "No, they are paid 1*l.* a week to come here." I discovered then that all these people had come up from the country for a month, and that they had been sent to Dublin to acquire as much art as would enable them to teach. What they wanted was to get diplomas. There is no human being that you could not teach to take a piece of clay and fashion it into such a shape that most people would recognise it as an apple. I saw a Christian Brother laboriously trying to turn a piece of clay into the shape of an apple, not because he wanted to do it, or because he had any interest in the matter, but because he wanted to be paid for teaching other people to take other lumps of clay and make them more or less like apples.

Mr. Justice Madden: But it has its serious side. I understand that these people were sent up to aid in the movement that is going on through the country in the primary schools—to aid in the training of hand and eye: they were educated in the School of Art in order to start that system through Ireland—that is the idea, right or wrong?—In Ireland most people will admit that they are not educated; many will admit, if pressed, that they could not be educated; but I never met anyone who would admit that he could not educate somebody else. In this country most people are not satisfied unless they are teaching someone else—generally something that they do not know themselves. People come to this school to learn to slop paint about and make messes with wet clay, and that is said to be developing art in the country. Some people may believe in it, but I don't.

You began by saying that you saw them making something into the shape of an apple?—Others were doing little bits of still life—a bit of curtain, a vase, &c. Of course, there is no better way of learning to paint freely, he must make his own composition; he must try to give a personal impression of what he sees. Whosoever was painting, the picture I saw was not concerned at all with what he or she saw, much more with trying to imitate a similar arrangement hanging on the wall, which had won a gold medal.

The Chairman: But we have to deal with possibilities?—Witness: People will always go to see a new building, police barrack, or museum.

The Royal Academy obtains great wealth from the people that visit it?—From people who come up from the country, but not from artists. Sir John Millais foresaw the danger of appealing to the country, and he said to me one day:—"The enfranchisement will be enlarged when Leighton and I are gone, and the Academy will become as popular as Madame Tussaud's." Give money to the Royal Hibernian Academy—the lighting is excellent, the rooms are not bad—by giving them money to clean 'em up and to provide more models, something quite sufficient can be done for Dublin.

Mr. Holmes: How about the teaching; what can be done

about that?—Oh, Mr. Orpen, who is going to give evidence here, is a very competent artist. He is a very good draughtsman, and, of course, men like Mr. Orpen would be a great advantage.

Mr. Justice Madden: The practical part of your evidence is that we should try to do what we can for art through the Academy?—Yes.

Why leave it in the place where it is; is it not an unfortunate position? You have said that we should assist the Academy where it is, but a great many, if not all, of the witnesses say that it would have a better chance of prosperity if it were in a more artistic centre, and where people would be more likely to find it out?—I think not. Anybody who wants to see a picture will go anywhere to see it. I don't believe that any person who would go to see a picture in Stephen's Green would not go elsewhere to see it. For a time you would get thousands to look at the new building, and then the state of things would be the same as in the old Academy. There won't be any difference. If people want to see pictures they will go anywhere to see them.

What would you do with the Metropolitan School of Art—would you shut it up or have a new system?—It is an enormous expense, and it is perfectly useless. I am sure of that. I think the money could not be employed worse. I don't say that I would give the whole 4,000*l.* a year to the Academy; that would probably be too large a grant; but I don't think anything can be gained by the Metropolitan School of Art. You might have a school for teaching lace and designs. I don't know anything about that.

The Earl of Westmeath: We hear a great deal about stained glass, and that there is a class for the encouragement of it in the Metropolitan School of Art. What is your opinion with regard to the teaching of stained glass?—It was made very beautifully in the fourteenth century, but if people can't say their prayers without stained glass I think their prayers are not worth much.

Do you think it can be encouraged in Ireland?—Modern stained glass is a very ugly thing, and it would be much better not to have it. To encourage it is only spending more money on religion—or religiosity, I should say.

The Chairman: We have heard something about the Glasgow School and the position it has got into. I suppose we cannot deny that that has done a considerable work in art education?—Oh, some of the painters of the Glasgow School have done very pretty things. Sir James Guthrie used to do some very nice things. You must have some sort of school, and I think a certain sum of money should be given to students to travel on.

Travelling scholarships?—Yes; Hughes got two scholarships and went to Paris. That was an excellent thing for Hughes; but what benefit it is to the nation that Hughes should reside in Paris I am a little at a loss to see. Hughes is a great friend of mine, and I think he merited his scholarships. The scholarships will enable people to go away to where they can learn art.

The Chairman: We hope they will come back.—Witness: Hughes is going to live there. If you go to the Beaux-Arts you see people there doing work because they want to do it, and when people want to paint they go to where painting is. France has been the source of all artistic inspiration for hundreds of years. People who want to paint pictures go to Paris. People who want to become priests come to Ireland. Why people should come to Ireland to paint pictures I can't understand.

You suggest that if anything is done it clearly should be done by some increase of grant to the Royal Hibernian Academy?—I think that is so.

Mr. Holmes: And should that grant be given in travelling scholarships to enable people to go to Paris?—Yes; I think it should. It is doubtful whether they would come back, but it would enable them to become artists.

You don't think they have much chance of becoming artists here?—I think there is very little natural impulse here. When art comes it comes suddenly and swiftly.

Professor Gerald Moira has been elected a member of the Society of Twenty-five English Painters. This completes the full membership.

The Exhibition of Pictures promoted by the Aberdeen Artists' Society was formally closed on Saturday evening. During the three months that it has been on view the collection, an exceptionally fine one, has been visited by in all 40,000 persons.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society, on the 6th inst., Mr. C. B. Howdill read a paper on stained glass. The president, Mr. H. S. Chorley, occupied the chair. The lecturer first dealt with the discovery and early history of glass, and afterwards described in detail the method of making glass—both stained and enamelled. He also explained the process of making ecclesiastical figure windows, from the first cartoon and cutting of the glass onwards through the painting to the leading and fixing. The different periods of Mediæval glass were described and illustrated in unique manner by many fine natural-colour slides of famous historic windows at York, Ripon and Oxford, the slides having been made by the lecturer himself. It was John Thornton, of Coventry, the glass-painter of the fifteenth century, who glazed the great east window of York Minster, and was paid about 900*l.* of our money for a window which, according to modern values, would cost about 2,000*l.* The old craftsmen of the fourteenth century, however, drove a harder bargain and secured better pay for their work. In the fourteenth century the rate of pay was 9*s.* (modern money) per foot for plain glass and 18*s.* per foot for coloured glass. That this was exceedingly good pay is shown by the fact that the cost of such work to-day would be roughly estimated at from 25*s.* to 30*s.* per foot. Some examples of the famous Fairford windows were also exhibited, and some of the windows were shown in detail and their meaning elucidated. Various phases of modern glass were illustrated, including some of the earlier and also late work of Burne-Jones at Christ Church, Oxford. The influence of Botticelli on glass painting was pointed out.

A vote of thanks to the lecturer was proposed by Mr. W. G. Smithson and seconded by Mr. G. F. Bowman, and a discussion afterwards followed.

ROYAL ACADEMY SCHOOLS.

MONDAY was the annual celebration of what is the great day for students of the Royal Academy schools. The distribution of prizes was deprived of some of its interest by the absence of Sir E. J. Poynter on account of illness. The keeper, Mr. Ernest Crofts, R.A., who, in the President's absence, should take his place on such an occasion, was also unable to appear through indisposition. The duty of distributing the prizes therefore fell to Mr. W. F. Yeames, R.A., the librarian, who was supported by several of the Academicians and Associates. The business of the evening was confined to the announcement of the awards. The following is a list of the successful students:—Landscape painting, *Sky Effect over Meadow and River*, with a Bridge in the Foreground, Creswick prize (30*l.*), Marianne Harriette W. Robilliard; design in monochrome for a figure picture, *Joseph Interpreting Pharaoh's Dream* (Gen. chap. xli.), Armitage prizes, first (30*l.* and bronze medal), Mary Dorothy Maltby, second (10*l.*), George Howard Short; design for the decoration of a portion of a public building, "The singers went before, the players on instruments followed after; among them were the damsels playing with timbrels" (Ps. lxxviii. 25), prize (40*l.*), Caron A. C. Oliver Lodge; cartoon of a draped figure, *A Female Figure in Classical Drapery carrying a Pitcher* (no background), silver medal and prize (25*l.*), Amy Joanna Fry; painting of a figure from the life, silver medal, first, Hilda Fraser Parker, silver medal, second, Susan Beatrice Lock; painting of a head from the life, silver medal, first, Ernest Stafford Carlos, silver medal, second, Francis E. Fitzjohn Crisp; perspective drawing in outline (open to painters and sculptors only), *The Pavilion inscribed to Sir Thomas Kennedy, of Cullean, Bart. (Earl of Cassilis): the tenth plate in Chambers's "Civil Architecture,"* silver medal, no competition; set of six drawings of a figure from the life, first prize (20*l.* and silver medal), not awarded, second prize (15*l.*), Francis E. Fitzjohn Crisp (disqualified owing to having received the same prize before), third prize (10*l.*), Kenneth Edwin Wootton; model of a design, *Abraham Sacrificing Isaac* (Gen. chap. xxii.), first prize (30*l.*), Millicent Wadham, second prize (10*l.*), Ferd. Victor Blundstone (disqualified owing to having received the same prize before); model of a bust from the life, silver medal, first, Helen Frazer Rock, silver medal, second, Frederic Lessore; model of a design containing figure and ornament, *A Pair of Spandrels on each side of a Circular Arch, representing respectively Science and Art*, silver medal, Geo. Duncan Macdougald;

set of four models of a figure from the life, first prize (20*l.* and silver medal), Frederic Lessore, second prize (15*l.*), Frank Gatter; design in architecture, *A Town Church, Travelling Studentship* (60*l.*), William Harvey; set of architectural drawings, *The Hall of the Brewers' Company*, silver medal, first, Sidney William Davis, silver medal, second, Albert Edward Bullock; set of architectural designs, prize (25*l.*), Francis James Watson Hart; perspective drawing in outline (open to architects only), *The Interior of the Hall of the Charterhouse*, silver medal, Albert Edward Brooker; original composition in ornament, prize (10*l.*), Frederic Lessore; set of drawings of an architectural design, first prize (15*l.*), William Harvey, second prize (10*l.*), Alan Leslie Belcher; architectural design with coloured decoration, *A Pavement in Coloured Marble for the Entrance Hall of the Royal Academy*, silver medal, Alfred Alexander Carter.

Landseer scholarships of 40*l.* a year each, tenable for one year, have been awarded:—In painting to Arnold Hyndman; in sculpture to Frank Gatter and James Alexander Stevenson.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the meeting held on Monday, December 3, the following candidates were elected as Fellows:—William Adamson, George Lennox Beattie, George Bell, Edward M. Blake, John Henry Blizard, Detmar Jellings Blow, Cecil Claud Brewer, William Lobin Trant Brown, Rudolph Maximilian Butler, William Henry Dashwood Cople, Frank James Chambers Carruthers, J.P., Marcus Evelyn Collins, Albert Selmar Conrad, William Cooper, William Morton Cowdell, Harry Bulkeley Creswell, William Crichton, James Davidson, J.P., William Lionel Eves, James Fasnacht, William John Fennell, Henry William Finch, Edwin Wollaston Fritchley, John Gaff Gillespie, George W. Hamilton-Gordon, Director of Public Works, Orange River Colony; Claude Harrison, Frank Morrish Harvey, Peter Lyle Henderson, Robert Allsebrooke Hinds, George Stanley Hudson, Arthur Rutherford Jemmett, William James Kemp, Sydney Decimus Kitson, William George Blackmore Lewis, James Hector McKay, John Campbell McKellar, Charles Rennie Mackintosh, William Hunter McNab, Duncan McNaughtan, Archibald Macpherson, F.S.A. Scot., Ninian MacWhannell, Henry Edmund Mathews, Stanley James May, Graham Nicholas, William Thomas Oldrieve, F.S.A., H.M. Office of Works; James Wallace Paton, James Piggott Pritchett, Edward Keynes Purchase, Walter Reid, David Robertson, A.R.S.A., Walter Wood Robertson, F.S.A., James Salmon, Jonathan Simpson, Ernest Willmott Sloper, Arthur Pole Small, Arnold Dunbar Smith, Alfred Steinthal, Harold Sudlow, Alfred Swash, Harry Ramsay Taylor, Isaac Taylor, Sir Alfred Brumwell Thomas, Richard Wellings Thomas, James Baird Thomson, William Aitken Thomson, George Alexander Troup, William Joseph Wagborne, William Snowball Walker, William Thomas Mynors Walker, John Waterson, John Watson, William Fleming Wilkie, James Leonard Williams, Cecil Locke Wilson, George Edward Withers, Ernest Woodhouse, Percy Scott Worthington, M.A.

As Associates.—Dennis Bamford, Henry Blackadder, Arthur George Bray, Albert Edward Brooker, Archibald Bulloch, William Wellesley James Calthrop, Harry Reginald Coales, Owen Hanworth Cockrill, Tilleard Horace Osman Collings, William Henry Howard Cooke, Reginald Wentworth Alfred James Cosway, Harry Beecroft Downs, Charles William Eaton, Ernest Harcourt Edleston, George Arthur Farrar, Francis Henry Fitzgerald, Frank Jamieson Forster, Frank Burwell Foster, James Black Fulton, Edward Hall Gandy, Laurence Mursell Gotch, Arthur Christopher Goulder, James William Hepburn, George Bernard Holland Hoole, Percy Cartwright Hoy, Francis John Humphry, David Bateman Hutton, Ernest Thomas Jago, Edwin Riddell Kennedy, Clifford Copeman Makins, C.B., Hugh John Cole Marshall, Harry Moss, Sydney Moss, Joseph Edward Mundell, Harold Franklyne Murrell, John Newton, John Parlett, Stanley Highfield Penlington, George Edward Phillips, Harry Arnold Rowbotham, Joseph Rycroft, Walter Pucker-Rylatt, Jasper Philip Salwey, Victor George Santo, William Peel Schofield, Henry Shackleton, James Smith, Francis Adams Sprules, Frederick George Stockdale, Charles Reginald Thickpenny, Wilfred Irwin Travers, Edward Holsworth Walker, Ewart G. Walker, Bernard Michael Ward, Bryan Watson, Bertie Cecil Westwick, Austin Woodeson.

CHURCHES OF THESSALONICA.

AT a meeting of the architectural section of the Royal Philosophical Society of Glasgow on Monday (Mr. R. D. Sandilands, president, in the chair), Professor Charles Gourlay delivered a lecture on "The Churches of Thessalonica," illustrated by lime-light views, and also by drawings and photographs, many of which had been taken by the lecturer himself. After brief references to the history of Thessalonica, Professor Gourlay described its beautiful situation, and showed how its importance as a seaport at the present day under the name of Salonica was owing to its excellent harbour, and to its being the capital of Macedonia. That Thessalonica was soon a stronghold of the early Christian Church was evident from St. Paul's two epistles to the Church there, while the fact that when the Turks became masters of the city they did not destroy but only slightly disfigured the churches in converting them into use as mosques had led to the preservation of a series of remarkably complete buildings in which the early Christian and Byzantine styles might be fully studied. The church of St. George was a fine example of the domed circular nave. The mosque of Eski Djouma showed the three-aisled church with capacious galleries, and that of St. Demetrius was a nearly perfect specimen of the five-aisled basilica. The church of Sta Sophia was one of the best examples of the Greek cross plan with central dome, and in addition had an outer aisle round three of its sides, while the Neo-Byzantine churches of St. Elias, St. Bardias, the Holy Apostles and St. Pantelemon, though all small, had each special features well worthy of study. At the close a vote of thanks was passed to Professor Gourlay for his lecture.

TESSERÆ.

Studies in English Houses.

AT Wressell Castle, Yorkshire, was a study called Paradise, coloured green and white, "where was a close, in the middle, of eight squares, latished about, and at the toppe of every square was a desk, ledged to set bookes on cofers withyn them, and these semid as yoined hard to the toppe of the closet; and yet by pulling one or al wolde cum downe briste highte in ravettes, and serve for desks to lay bookes on." At Naworth Lord William Howard's library was a small room, in a very secret place, high up in one of the towers, well secured by doors and a narrow staircase. In it was a vast case, 3 feet high, which opened into three leaves, having six great pages pasted in, being an account of St. Joseph of Arimathea and his twelve disciples, who founded Glastonbury, and at the end a long history of Saints, with the number of years and days for which each could grant indulgences. The roof was coarsely carved, the windows high, and had to be ascended by three stone steps, from precaution of the owner, not to be shot at. Close by the library was an ancient oratory, richly ornamented on the sides of the ceiling with coats of arms and carving in wood, painted and gilt. Peacham recommends that studies should face the east, to avoid moths and mouldiness. The clerk at Oxenford, in Chaucer, had at his bed's head twenty books clad in black or red. In another we find a curtain hanging half-way up, and a narrow ledge upon which books were placed, with their sides next the wall.

Piranesi.

Piranesi was well known to several English artists who studied in Rome; among others, to Mylne, the architect of old Blackfriars bridge, with whom he held a regular correspondence for several years, and for whom he engraved a view of that structure in its unfinished state, representing with precision the centres for the arches, &c., for the sake of preserving a memorial of them. Some of his works are also dedicated to Robert Adam, the architect, with whom he became acquainted at Rome. Piranesi was elected a fellow of the Society of Antiquaries in 1758, an honour he was proud of possessing, as he always carefully subjoined that title to his name in his subsequent works. He was likewise a member of the Academy of the Arcadi, by the name of "Salernido Tisio," as he has given it in one of his frontispieces; this was according to a fantastic custom of that Association, to give a new nomenclature to persons admitted to their privileges. Piranesi has been accused of allowing his imagination to embellish his designs, even when given as real views; and, it is said, not without reason. But this accusation must not be repeated to his discredit, as there are certainly many circumstances in

nature where the hand of taste is required to correct exuberance and place objects in the most picturesque and agreeable point of view. It is true that this important task should be entrusted to genius alone; but Piranesi most assuredly was admirably qualified to undertake it. Though professedly an architect, he seems to have indulged his taste less in creations of his own than in recording the works of old, though several of the sovereign pontiffs, especially Clement XIII., gave him commissions to repair or rebuild several of the churches of Rome, among which the principal were the Priory of Malta and the church S. Maria del Popolo. The lover of art regards Piranesi with admiration, as one of the first names in art, for his ingenuity and vastness of invention, his excellence of execution and the wonderful originality and boldness of his designs; but if a scholar, he regards him with still fonder enthusiasm as one who gave up his energies to the perpetuating the relics of antiquity, and by his learning and research illustrating those remains, and so teaching the public justly to appreciate them, preserved them from wanton attacks and neglect to which they had been previously exposed.

Primitive British Architects.

The earliest British architect on record, that is, apart from those mentioned in legends, such as Adhelm, was, according to William of Malinesbury, Ninias or Niniane, whom chronology places about the year 432. He built a church of white stone on the confines of England and Scotland, which appeared at that time so like a miracle to the Britons that it bore the name of *Candida Casa*. It stood in a place called White Heru, which is in Galloway in the south of Scotland. From the time of Ninias in 432 we can glean no information until 200 years afterwards of other architects or architecture, when Wilfrid, who was Archbishop of York in 600, rendered himself famous, during the latter part of the seventh century, for the churches of Ripon and Hexham, &c., of which he was the architect. The church of St. Andrew at Hexham was celebrated by an ancient writer, Eddius, who had seen it, as a miracle of art, and who speaks of it in the following manner:—"Its deep foundations and the many subterraneous rooms there artfully disposed, and above ground the great variety of buildings to be seen, all of hewn stone, and supported by sundry kinds of pillars and many porticoes, and set off by surprising length and height of the walls, surrounded with various mouldings and bands curiously wrought, and the turnings and windings of the passages, sometimes ascending or descending by winding stairs to the different parts of the building, all of which it is not easy to express by words." Richard, prior of Hexham, more fully describes this building in A.D. 1180; the building was then in a decaying state. Wilfrid also repaired York Cathedral, covering the roof with new lead, and filling the windows with glass in such a manner as to prevent the entrance of wind and rain, and yet admit the light. The frequent journeyings of this prelate to the court of Rome and his visits to the churches there, with the instructions which he received from Archdeacon Boniface, made him an excellent architect, while the opportunity which he had of engaging Roman workmen to execute his plans in England gave him every advantage of having his excellent ideas reduced to practice.

Prize Plans for Irish Labourers' Cottages.

SIR,—Now that these are being prepared it may perhaps interest some of your readers to have the views of one who, though not in the profession or in the building trade, has had some experience of erecting them and has given the whole subject much attention.

The primary need of human existence is air, and everything should be done to secure as free a supply as possible; windows should therefore open conveniently in all weathers. As sunlight is also a great foe of disease, and as darkness and dirt go together, the windows should be large. In my opinion only the ordinary sash with weights and pulleys should be used, and the lower sash may be fixed.

Casement windows should be prohibited by law, for no one should sleep in any bedroom the window of which is not more or less open all night; the more the better. Now casement windows cannot be opened in windy or wet weather. Unless people can always open their windows

more or less, they will rarely open them. If they must put up with bad air on wet nights they will make it do on fine ones. It is too much to expect a working man to get up in the middle of the night if the wind rises to shut his window. He will take care next night that he is not so disturbed.

Ireland is scourged with consumption, the deaths from this being nearly 13,000 per annum and steadily rising. We have yet to hear of anyone who habitually worked and slept in rooms with the windows wide-open who afterwards contracted this disease.

Another objection to casements is that, if left partly open, they can easily be opened wide by anyone from the outside. This enables a tramp to abstract things from the house in the temporary absence of the owner, and gives a feeling of insecurity to those occupying ground-floor bedrooms, and may make them shut their window at night. The sash window, if the lower one is fixed, is quite safe.

The sash never leaks, and if green hemp is specified for the cords, needs practically no repairs. The casement window will leak, the hinges get out of order, the frame twist and the fasteners get pulled off in storms. All the sixty or seventy exhibition cottages at Letchworth have them, and I observed that, though put up regardless of cost, about half of them would not open at all freely, many not at all.

These windows are picturesque, and so in England are the rage. Bournville and Port Sunlight have helped to make them popular, but in my opinion there are few bedrooms in either of these "model" villages that any sensible person would spend a night in if he could help it.

The chimneys should not be in the gables; a very large part of the heat of the fire is thereby wasted—quite enough to keep a couple of bedrooms warm and dry.

I may say the judges of the Letchworth Exhibition cottages condemned chimneys in the gables and casement windows, and then gave first prize to a cottage that had both these defects.

I think that one-storey cottages are best. I am aware that they are a little more expensive than two-storey ones, as the roof is larger, but this enables enough rain-water to be stored in a concrete cistern to supply the family, and the expense of a well may be saved, and the water is better for washing. The can of water daily for drinking and cooking can be carried a considerable distance without much trouble. The cost of the stair is saved, and if the eaves are wide the house is kept drier.

These cottages should never be built in pairs. It saves very little when the cost of a wall to separate the gardens is taken into account, and leads to constant trouble between the neighbours, from quarrels among the children or about trespass of fowls. Besides, each house should be set so as to get the maximum of sunshine, and this is impossible if two are built together.

In North China, where fuel is dear, they face all houses south, and one side of the street is always a blank wall. They say "the heat of the sun costs nothing."

Now, single two-storey houses of this size will have a very "tower-like" appearance. It may be a sentimental idea, but the one-storey cottage is characteristically Irish, and I would like to see it preserved.

ROBERT BROWN,

Honorary Secretary of National Association for
Prevention of Consumption, Ulster Branch.
Donaghmore, Tyrone.

GENERAL.

Sir Aston Webb's design for the concert organ to be erected in the great hall of the new university buildings at Bournbrook has been adopted. The specification of the organ has been drawn by Sir Edward Elgar.

The Derby Town Council have sanctioned the proposal to purchase property for 3,450*l.* to enable the enlargement of the art gallery to be carried out.

The Director-General of Archaeology, India, has sanctioned a grant of 10,000 rs. for the restoration of old temples in Kajraha in Central India.

Mr. Muirhead Bone's drawing at the New English Art Club exhibition—"The Great Gantry, Charing Cross Station"—a drawing made on the spot in the spring of the present year, has been purchased by subscription through the National Art Collection Fund for presentation to the British Museum.

The Winchester City Council have been informed that a fault has been discovered in the foundations of the Old Guildhall.

Professor W. R. Lethaby, F.S.A., has been appointed by the Dean and Chapter "Surveyor of the Fabric" of Westminster Abbey. Mr. Arthur G. Wallace has been appointed assistant surveyor.

Miss Alice Perry has been appointed interim county surveyor of County Galway in the room of her father, the late Mr. James Perry. The permanent appointment will be made at the February meeting of the council.

The Improvements Committee of the London County Council have informed the Borough Council that they are not at present prepared to advise the suggested extension westwards of the Chelsea Embankment, and do not propose taking any further action in the matter.

The Walsall Town Hall Committee in a report issued on Saturday state that as a result of negotiations regarding the threatened litigation over the erection of the new municipal buildings, all questions between the Corporation, builders and architect in relation to the outstanding claim for extras had been satisfactorily settled, an allowance of 1,025*l.* having been made to the Corporation off the demand made by the builders, who had, in addition, paid costs amounting to 300*l.*

The Library Committee of the Liverpool City Council at last week's meeting recommended that an application be made to the Local Government Board for a provisional order to enable the Corporation to borrow 35,000*l.* for library, museum and art purposes, but an amendment was accepted to reduce the amount to 12,000*l.*

Messrs. E. & F. N. Spon, Ltd., have published a "Reference Book for Statical Calculations," by M. Francis Ruff, for the use of boards of works, architects and engineers. It gives force-diagrams for frameworks, tables and instructions for statical calculations for various classes of building and engineering structures.

The Mersey and Irwell Joint Rivers Committee have agreed that a civil engineer be appointed as chief inspector. He should be a member or Associate of the Institute of Civil Engineers, and will receive a salary of 600*l.*, office staff and travelling expenses being provided.

The International Society of Sculptors, Painters and Gravers have elected the following Associates:—O. de Boznanska, Cecilia Beaux, Simon Bussy, Walter Crane, P. Dupont, A. Jamieson, A. E. John, Elizabeth Shippen Green, G. W. Lambert, J. Kerr Lawson, Sydney Lee, D. McGill, A. Maillol, Harrington Mann, J. Oppenheimer, W. Orpen, Charles Ricketts, Allen W. Seaby, H. le Sidaner, Ch. Storm van's Gravesande, Havard Thomas, A. G. Walker, H. Wolf. M. A. Bartholomé was elected an honorary member.

The Scarborough Corporation have resolved that the excavation of the Castle Keep and the improvement of the Castle Holms be proceeded with by the unemployed of the town, under the direction of the borough engineer, with a view to relieve the distress in the town.

At the Last Ordinary Meeting of the Institution of Civil Engineers it was announced that 21 associate members had been transferred to the class of members, namely, Messrs. H. C. Barnard, W. B. G. Bennett, E. F. S. Bowen, J. S. Brodie, F. C. Caffin, G. F. Carter, H. R. Ford, Edward Gabbett, Percy Hawkins, J. H. Johnson, G. O. H. Klopp, L. A. Legros, F. J. Pigott, R. N. H. Reid, E. F. Sanders, Herbert Shaw, R. J. Wallis-Jones, T. R. J. Ward, T. P. Wilson, Alexander Woodburn, J. W. Wyatt. It was also reported that 194 candidates had been admitted as students. The monthly ballot resulted in the election of six members—G. W. Buckwell (Barrow-in-Furness), F. R. Hull (Rothbury), E. S. Lindsey (Trichinopoly), F. G. Sharrock (London), J. L. Stirling (Rangoon), and C. Vaughan (Millom)—and six associates.

The Sub-Committee of the Lord Provost's committee on the restoration of the monuments of Edinburgh had a meeting with regard to the work which has been in operation for some time. It seems that a difference of opinion manifested itself with regard to some of the operations. Mr. Pittendreich Macgillivray, who reported on the matter, recommended that after the process of cleaning the monuments should be covered with a solution. It was this part of the report which led to discussion, the opinion being expressed by one member that to do this would be very injudicious, as the action of frost might be most destructive. It was agreed, before coming to any decision, to ask Mr. Macgillivray to have a meeting with the committee. The committee decided to defer operations on any of the other monuments till the summer.

The Architect.

THE WEEK.

SIR WILLIAM ARROL & Co. have in the course of a few years gained so much experience in bridge-building there can be no question about their fitness to undertake the widening of Blackfriars Bridge. The present structure was completed in 1869. The contractors were Messrs. P. & N. THORN, and the engineer was Mr. JOSEPH CUBITT. In the address which Sir WILLIAM TITE delivered as president of the Institute he expressed wonder at the successful manner in which granite, Portland stone and metal were combined. The hardest granite, he said, was polished in an astonishing way, and fitted with smoothness and beauty equal to joiner's work. In those days the polishing of granite was less common than now, and the massive columns were undoubtedly a novelty in bridge-building. Although they constructed the bridge in so excellent a manner, the contractors would not consider the work to be entirely fortunate for them. They brought an action against the Corporation which, after going through all the Courts to the House of Lords, was decided against them. Their case was that they relied on the plans as being practicable. But it was held that they should have tested the documents. In the specifications it was stated that caissons were to be used, but they were found to be impracticable. The width of the bridge between the parapets is at present 75 feet, and the roadway is 45 feet wide. When the alterations are made the roadway will be 73 feet in width, and each footway will be 16 feet wide instead of 15 feet as at present. The alteration will take place on the western side, and it is believed the traffic can be accommodated without the erection of any temporary roadway. The bridge which the present structure superseded was designed by Mr. MYLNE. His design was made the subject of attack by Dr. JOHNSON because it was proposed to use semi-elliptical arches.

DURING the present week the residence of the Archbishop of PARIS in the Rue de Grenelle has been more prominent in the thoughts of Parisians than any of the great buildings of the French capital. In evicting a very aged prelate the French Government did not remember SHAKESPEARE'S advice, that while it is excellent to have a giant's strength it is tyrannous to use it like a giant. No doubt the building was desired for a public office. But so summary a method of obtaining possession was not worthy of a people who pride themselves on their courtesy. The building was constructed in the eighteenth century from the designs of CHERIPTTEL, who was a pupil of BLONDEL, and in his twenty-second year was awarded the Grand Prix for architecture. Several churches in Paris were designed by him. In the Rue de Grenelle he constructed the Hôtel Rochecouart as well as the Hôtel Duchâtelet, which in recent times was the residence of the archbishops of Paris. The Marquise DU CHÂTELET was a scientific lady whose life was closely connected with that of VOLTAIRE'S. In the reign of LOUIS XVI. it belonged to the Duc DE GUICHE. Under the First Empire it was the property of the Duc DE CADORE. At the time of the Restoration it was turned into a public office, next it was used as an Austrian embassy, and finally it became the episcopal palace. Apparently it is destined to be again used for one of the Ministers of the Republic.

THE highways committee of the London County Council have reported against allowing omnibuses to run along any route without the approval of the proper authority. In Paris the companies have to make substantial payments in respect of the privileges they enjoy, besides contributing towards the cost of the repair of the roads. The effect on road surfaces and foundations in the Metropolis has been described by a Parliamentary

committee, who stated that "so long as our streets are full of holes, so long injurious vibration must be caused by heavy vehicles. A weight of a ton and a half on one wheel of a laden motor omnibus, not falling by gravity, but driven downwards by a powerful spring, into a hole half an inch or more deep, delivers a most powerful blow that cannot fail to set up serious vibration." Some of the surveyors have also testified that macadamised and gravelled roads are not adapted to withstand heavy motor cars. The foundations especially suffer. It has also been ascertained that the amount of lubricating oil, &c., which escapes on to the roadway from motor omnibuses, and which is very noticeable, has a very serious effect on asphalted roadways. The oil rapidly dissolves bituminous matter in the asphalt, and the latter becomes a soft pasty substance, which is easily cut into holes by the wheels of passing traffic. The maintenance of the County Council's tracks cost about 525*l.* per street mile. The rates paid on the permanent way are about 267*l.* per mile. The owners of motor omnibuses escape from similar expenditure. The Council have also to consider the complaints of occupiers of houses along the routes, and it is found that in consequence of the objections the number of empty houses in important streets in the central and western districts of London has increased since the advent of motor omnibuses, and that the value of the property has been depreciated, and also that even shop property may be injuriously affected. In fact, complaints have been made that the volume of business transacted in shops has been materially reduced. It is recommended that the attention of the Home Secretary should be called to the grievance, in order that he should consider whether legislation should not be introduced requiring a proper contribution to be made by the owners of these vehicles towards the cost of maintaining the streets.

THE Mayor of New York has appointed a Commission of several experts to investigate and report upon the administrative chaos of that city, which far exceeds that of the vestries of old days in London. The control of the streets is vested not in one department alone, but in many. Thus the Police Department, the Department of Street Cleaning and the Bureau of Encumbrances are each required by law to remove obstructions from the streets, while the Bureau of Buildings is permitted to grant permits for their partial occupation during building operations. The Department of Water Supply, Gas and Electricity, and the Bureau of Sewers have the right to allow the surface of the streets to be opened, while the Bureau of Highways is charged with the duty of keeping the surface of the streets in repair. In addition, the public service corporations claim certain rights to open and disturb the surface of the streets for various purposes, after the exercise of which it is often difficult to obtain from them a speedy and satisfactory restoration of the street. As a result of this divided responsibility, a street is often allowed to remain in a deplorable condition, while it is impossible to call any one department to account for its existing defects. If the Police Department or the Department of Street Cleaning remove building material that is unnecessarily obstructing the traffic on a street or a sidewalk, the defence is offered that such an obstruction has been permitted by the Bureau of Buildings. If it is sought to hold the Bureau of Highways responsible for the condition of a pavement, it is replied that the Bureau is powerless to proceed, because the openings have been ordered and continued by the Department of Water Supply, Gas and Electricity, or the Bureau of Sewers. The Mayor has the hope that his Commission will be inspired to devise some comprehensive plan which will do away with the existing conflict of jurisdiction and concentrate the responsibility for the administration of the city streets under one central authority.

THE LONDON COUNTY HALL.

IT may be taken for granted that since the last week of July, when the general conditions of the competition for the new county hall of the London County Council were announced, a great many sketches of the building have been drawn. There was not sufficient information available to enable a plan to be prepared. But at least it was possible to sketch the long line of frontage to the Thames, according to one's fancy. We publish to-day the conditions which are to govern the competition, and although the block plans are absent, they are sufficient to enable architects to realise the extent of the work which will have to be accomplished.

It will be seen that there is not any essential alteration from the general conditions which we published in July. There is to be a preliminary competition open to architects of any nationality. Works on the scale of the new county hall are not often projected in this country, and we readily understand the objection of some architects when they find that all the world can take part in the contest on equal terms with Londoners. But in advanced or progressive corporations like the London County Council there is what may be called an international element, and it is supposed to display itself in other things besides visits, entertainments and inspections. By a remarkable coincidence representative architects from England, Ireland and Scotland at the last Congress approved of the adoption of international competitions. If it were known that a few days after the resolution had passed the County Council of London would propose to open an international competition, it is not unlikely that those assisting at the Congress would be less impulsive in accepting internationalism with all its consequences.

From the designs submitted in a preliminary competition, not less than ten and not more than fifteen of the best are to be selected in private by assessors, and the authors will take part in the final competition. That clause remains as before. There is a slight alteration in the clause relating to the eight "leading architects" who, in addition to the ten or fifteen of the selected architects of the first competition, are to share in the final contest. At first it was said they were "to send in designs before the expiry of the period within which designs must be sent in for the preliminary competition." In the new regulations it is said, they "shall not be required to lodge their designs with the Council until the date fixed for the delivery of the designs in the final stage of the competition." The new rule allows more time, or about five months, to the selected eight for the preparation of designs, and to that extent is a great convenience to them. But there is a chance that in consequence of the concession some of the unsuccessful competitors will say that features in their designs found their way into some of the designs of the "leading architects." If the original arrangement had been adhered to that objection could not arise. It will be said, and with reason, that not one of the eight architects is likely to seek for inspiration among the unsuccessful designs. But any one who has had experience of competitions is aware that slight coincidences are often interpreted in an extraordinary manner.

Amidst so many architects possessing claims to be considered as "leading," it must have been difficult to make a selection. The establishment committee say it was after most careful consideration they decided on Mr. J. BELCHER, Mr. W. FLOCKHART, Mr. ERNEST GEORGE, Mr. H. T. HARE, Mr. T. G. JACKSON, Mr. E. L. LUTYENS, Mr. E. W. MOUNTFORD and Messrs. NICHOLSON & CORLETTE. It is undoubtedly a distinction to be selected, whatever may be the result in the competition. Each of them is, moreover, to receive a fee of 200 guineas, in common with those who have been successful in the preliminary stage. Under the peculiar circumstances attending architecture it is likely to be concluded that the eight leading architects have been

unduly favoured. It will perhaps be wiser to wait until the competition is over before giving a judgment on what is a novel experiment. The proposal to pay arose out of the belief that the eight architects were likely to be too busy to accept the risks of a competition in which an immense number of architects are expected to take part. But busy men are not always successful in competitions; and, indeed, in some of the most important cases the prizes have been carried off by those who were unable to point to a large number of executed buildings as evidence of their skill. It was expected that the list of selected architects would help to indicate the style that was desired, which was supposed to be some variety of Renaissance. However, the names do not afford any clue, for the architects represent several styles.

The difficult task of selecting not less than ten and not more than fifteen of the best designs is to be undertaken by Mr. NORMAN SHAW and Mr. W. E. RILEY, the Council's architect. In the second competition the two judges will have the aid of a third assessor, who is to be nominated by the architects taking part in the final stage. Mr. NORMAN SHAW and the elected assessor are to receive 1,000 guineas each; Mr. RILEY apparently receives no remuneration for his services in judging. It is stipulated, however, that he will possess discretionary power in matters relating to internal economy, building construction and stability with other works, and that he shall receive one-tenth of the five per cent. commission allowed as architect's fees. It is assumed that the sum of 850,000*l.* will be sufficient to provide a substantial structure suitable for the Council's purposes, exclusive of furniture and embankment superstructure, also of any special foundation which may be necessary.

The particulars given in the instructions show the minimum accommodation required by the Council. It is distinctly mentioned that competitors will have license to depart from the particulars in any details which may be deemed necessary for the development of the elevations. In considering the designs the greatest importance will be attached to simple and convenient planning. The designs in the preliminary competition are to be sent in on May 7. The date of the second competition will be October 3. But the latter will be mainly dependent on the number of the designs to be judged. A large number of inquiries have been already received for official copies of the instructions, and they will be issued as early as possible in the coming year.

It is difficult when considering the competition for the London County Hall to avoid recalling the competition for the Houses of Parliament on the opposite bank of the river. The old buildings were destroyed on October 16, 1834. In a short time Sir ROBERT SMIRKE was instructed to prepare designs for a new structure. That arrangement was not approved by several influential people of the time. In June 1835 the conditions of a competition were arranged, and it was decided the style was to be Gothic or Elizabethan. Four premiums of 500*l.* were promised, it being understood that the architect who won the first premium should carry out the work unless some grave cause to the contrary were discovered, in which case he was to receive an extra premium of 1,000*l.* On November 1, 1835, ninety-seven sets of designs were sent in, and on the last day of February 1836 it was announced that the first premium was awarded to CHARLES BARRY. The buildings were estimated to cost, exclusive of furniture and fittings, 850,000*l.*, and it was stated that they would be completed in about six years. For the new county hall there is likelihood of many more than ninety-seven drawings being submitted. The conditions of the competition for the Houses of Parliament were much more difficult—at least, as interpreted by BARRY. The Commissioners had to admit how minute were the drawings, for apparently BARRY spared no trouble in showing details. The London County Council are

not over-exacting in the requirements for the preliminary competition. All who love London and architecture must devoutly wish that the best design shall win, in order that the Metropolis may possess the finest example of municipal council houses.

REINFORCED CONCRETE.*

ABOUT two years ago we noticed the first edition of the large volume on reinforced concrete by Mr. C. F. MARSH. That time is sufficient for the introduction of many improvements in the use of materials which have received an extraordinary amount of attention. It might almost be supposed that concrete and steel were destined to supersede all other materials. And any opposition to their use does not arise from experts in construction, but from municipal and other authorities, who view departures from everything sanctioned by experience as likely to create danger. The Local Government Board, for instance, insist on loans for structures in concrete being repaid in fifteen years, or half the time allowed to other materials. When we find the London County Council proposing to undertake the preparation of concrete blocks we may suppose that one consequence will be a more definite recognition of the material, especially when it is supplemented by steel in various forms.

The third edition of the volume bears the name of Mr. WILLIAM DUNN on the title-page. It is acknowledged that he gave the author considerable assistance in the preparation of the first edition, and that he has aided also by letterpress and diagrams in the enlarged edition. One great difference is that the part of the book dealing with calculations has been rewritten and simplified. The number of illustrations and diagrams has been increased from 512 to 618. New systems have been described, and the pages therefore embody the latest conclusions on concrete.

The authors' impartiality must strike the reader after perusing a very few pages. Over forty different systems are described in detail, but preference is not given to any one of them. It is also shown that concrete work cannot be safely executed without much deliberation and care in the choice of materials. Nor is the use of concrete advocated on the ground of being more economical than ordinary building. In one place they say:—

Considerable experience in reinforced concrete for building construction has demonstrated that it is not a particularly economical material; its special claims lie rather in other fields. The ordinary building floor of steel joists and concrete is in general cheaper; but if the joists are fully protected against fire by covering them with concrete or plaster or expanded metal, the reinforced concrete floor in which all the metal is surrounded by concrete will be found as cheap and for heavy loads probably cheaper. For walls there is in general no saving in first cost, but the saving in space, and the power to resist injury from shocks and vibrations or rupture from bad foundations, must be taken into account. Reinforced concrete is specially economical when used for warehouses or factories where the walls can be formed in bays with columns or lintels.

The indiscriminate use of reinforced concrete is not advocated in the book, although remarkable examples of what can be done with the material are to be found among the illustrations. Germans and Frenchmen have opportunities for investigating theories of construction which are neglected in England, and as concrete lends itself to an embodiment of the results attained by mathematics and mechanics it follows that the majority of the systems come from foreigners. Indeed, some of the illustrations might be described as concrete and steel diagrams. One Hungarian engineer, whose system has been largely employed in Europe and

America, we are told, likens it to a spider's-web firmly attached to the points of support, for he employs steel wire instead of beams. M. PIKETTY, on the contrary, is described as being so far original that he has never instituted a system. In every instance he adopts a different treatment; he prefers round rods to flat bars or hoop-iron. Herr RABITZ uses ordinary galvanised wire network for reinforcement. The pages present many examples of ingenuity in the arrangement of materials, and somehow they all appear to serve the purposes for which they are intended.

One of the most important considerations in dealing with reinforced concrete is the question of cohesion. The elements of concrete may, if proper precautions are taken, become almost inseparable, *i.e.* if good cement be employed and care is taken in the mixing. But it is not so plain about the adhesion of the concrete with the metal. A brick parapet can be raised on the top flange of a rolled girder, which will be perfectly secure if strong cement is used to connect the bricks with the girder. But concrete differs from cement in being less adaptable. On this subject we are told:—

The property generally referred to as "adherence" of the concrete to the metal is probably only slightly due to any direct adherence, unless the surface of the metal is pitted, and would perhaps be better defined as a frictional resistance due to the setting of the concrete, the outer portions of which harden first, causing the concrete around the reinforcement to become compressed, and so clasp the reinforcement tightly. There is very little real adherence to clean iron, as can be easily proved by the simple experiment of moulding some concrete and placing a piece of square iron on the top, lightly pressing it to the concrete with the fingers. When the concrete has set it will be found that there is very little difficulty in removing the iron. If the piece of smooth square iron is pressed well into the concrete there will be considerable difficulty in its removal, but it will be found that this is caused by the holding of the sides by the concrete, and that the bottom comes away quite easily and is perfectly clean, the concrete being left with a smooth bottom surface. Also, when a reinforced structure is being demolished the iron frequently comes away fairly easily when the concrete is broken away from it on three sides. To whatever cause this property is due, however, it is one which is of the greatest importance in works of reinforced concrete, the resistance obtained in many of the systems now in use depending on it almost entirely. Tests that have been carried out for determining this resistance show that the load which produces the first loosening of the reinforcement is not proportional to the surface of adherence, and it seems very probable that the metal does not commence to slide through the concrete until its limit of elasticity is passed and it commences to become reduced in diameter. MM. Bauschinger and de Joly, from a series of experiments, concluded that the "adherence" of concrete to iron or steel rods was from 570 to 710 lbs. per square inch of surface.

An account is given of the latest experiments of Professor TALBOT, of Illinois, which were arranged for the purpose of discovering all the varieties of failures. They were carried out on beams 12 feet long, and between sixty and seventy were employed. The results obtained by other American professors are likewise given. These are offered for the purpose of illustrating the part of the book relating to calculations of steel and concrete beams and arches. Examples are given of spiral staircases, for the construction of which reinforced concrete appears to be particularly suitable. An example is given in Mr. G. W. VANDERBILT'S house in New York which could with difficulty be carried out in any other material. In a chapel at the Naval Academy at Annapolis there is a dome 70 feet in diameter which is carried by cantilevers from the main columns and which have a curved bracket shape.

A copy is given of the Prussian Government regulations as to the employment of reinforced concrete construction in buildings. Applications for permission to build must be accompanied by drawings, statical calculations and descriptions to enable the authorities to judge of the general arrangement as well as details.

* *Reinforced Concrete.* By Charles F. Marsh and W. Dunn, with 618 Illustrations and Diagrams. Third edition. (London: Archibald Constable.)

The origin and nature of the materials and the proportions in which they are to be mixed must be stated. A certificate from the official testing-station has to be supplied proving their quality. Prussian Portland cement must be employed, and certificates are to be given containing statements about constancy of volume, time of setting, fineness of grinding, tensile and compressive strength. Sharp sand, gravel or other recognised material is insisted on. The compressive strength of the concrete after twenty-eight days is to be stated. The building authority can have the materials tested, and concrete blocks for that purpose are to be supplied. As a rule the concrete is to be mixed by weight and in such quantities as are required for immediate use. Especial care must be taken that the iron for reinforcement is correctly placed and thoroughly coated with cement mortar. Work may not be carried on during frost, except in cases in which the possibility of damage by it is excluded. Until sufficiently hardened, the concrete must be protected from the action of frost, from premature drying, or from shaking or overloading. When inspected for approval portions of the building must be exposed, and test pieces may be taken from parts of the finished building. Rules are given for the statical calculation of the different parts, and in columns the concrete is not to be stressed beyond one-tenth of the ultimate compressive strength. The factor of safety for steel is to be five. The regulations show that in Germany there were doubts about the new material. But as concrete can be said to have demonstrated its safety, some relaxation of the rules could be allowed without any risk of danger to life or limb.

We may assume from the use made of reinforced concrete during a few years, and from the stability of the works executed by firms of repute, that in the coming years it will be realised that far greater use can be made of the combination. The volume by Messrs. MARSH and DUNN enables a reader to comprehend the extent of the possibilities for reinforced concrete, and the various arrangements available in order to overcome the kinds of difficulties likely to arise. All the conclusions are trustworthy, and the explanations are adapted to enlighten novices as well as to offer suggestions to those who possess experience.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of British Architects was held on Monday evening last at 9 Conduit Street, W., Mr. T. E. Colcutt, president, in the chair.

Sir WILLIAM EMERSON, speaking on behalf of the subscribers, said it was his pleasurable duty to ask the Institute to accept a portrait of their past president, Sir Aston Webb. He said he wished to testify to the great ability Sir Aston Webb brought to bear on all questions which came before him as president of the Institute and to his courtesy and unflinching tact and judgment. Sir Aston Webb's career, he said, was a lesson to all of them, inasmuch as it was the outcome of his capacity for hard work and industry. The portrait, which was painted by Mr. Solomon J. Solomon, A.R.A., was, the speaker thought they would all agree, an excellent one.

The PRESIDENT formally accepted the portrait. He said they all knew Sir Aston Webb, his great talent and his distinguished career; but beyond all that was the personality of the man, who inspired the affection of all those who had met him. Sir Aston Webb was unable to attend the meeting, but had sent a letter, which the President read. In the course of the letter Sir Aston Webb wrote:—"Still I must say to you how much I appreciate the compliment (which the fact that it is a usual one to past Presidents in no way diminishes), that my portrait should hang in such distinguished company on the walls of the Institute meeting-room, where I have spent so much time, sometimes in friendly conference, sometimes in friendly combat, but always enjoyably, and my only regret is that I have reached the stage when I must leave the arena, make my bow, and hang lifeless upon its walls. It is the fate of all, and quite

right that it should be so, and from our place of vantage on its walls I trust and believe we shall watch fresh and vigorous generations carrying on the work of the Institute." Mr. W. J. DIBDIN read a paper on

The Composition and Strength of Mortar.

The author said that the composition of ordinary lime mortar in relation to the resulting strength is in the highest degree important. The by-laws of the London County Council regarding the composition of mortar merely specify that it shall be composed of freshly burned lime and clean sharp sand or grit without earthy matter, in the proportions of one of lime to three of sand or grit, but contain no reference to strength, leaving it to be inferred that if the composition is within the strict definition the strength must necessarily be practically constant—quite apart from the particular purpose for which the mortar is to be employed. Further, no "factor of safety" seems to have been considered; so that, whether the mortar is used for a 10-foot wall or one of 100 feet in height, the by-laws equally apply without any precautions.

The author proceeded to describe a series of experiments he had carried out on briquettes and blocks specially made for the purpose, the results of which clearly indicated the danger of mere composition safeguards. These results were discussed under the following headings:—(1) Effect of washed sand of varying degrees of fineness; (2) Effect of varying quantities of clay added to the sand; (3) Effect of washing out the clay naturally present in sand; (4) Effect of varying the time when the mortar was used after being first made; (5) Strength of raw materials employed; (6) Effect of the variation of the percentage of voids in the sand used; (7) Effect of composition on spalling.

The results of the tensile and crushing tests were shown in diagram form, the details being set out in a number of elaborately prepared tables. Diagram 1 showed that mortar made with the proportions of one volume of sand to one volume of lime with the sand unwashed as received had a crushing strength of 150 lbs. per cubic inch. When the sand was increased to two volumes the strength fell to 92 lbs. per inch. With three volumes sand it was only 52 lbs., and with four volumes 53 lbs. This experiment clearly indicated that an arbitrary limit of three to one is unsatisfactory, as it would prevent the use of the "excess" of lime, which in this case gave three times the crushing strength of that obtained when the by-law proportion of three to one was employed. In all the subsequent sets of this series the sand was used washed and graded. The illustrative diagram clearly brought out the fact that when the proportions were from one or two of sand to one volume of lime the strength was greater than when three volumes of sand were employed in all those cases in which the sand was coarser than $\frac{1}{16}$ -inch; but when the grading was from $\frac{1}{16}$ -inch and below, the strengths of the various makes were practically equal, viz. from 58 to 66 lbs. per inch.

The tests for tensile strength were in the same ratio, and clearly indicated that with these particular sands an excess of lime in contravention of the by-laws was a distinct advantage.

The results given in a further series of tests showed the effect of time up to eleven days between the moment when the mortar was mixed and that at which the briquettes and blocks were prepared. From these it would seem that up to seven days there is an increased strength, but after that time—that is to say, after the mortar had once set—the effect of a second breaking up was distinctly detrimental, although better results were even then obtained than at any time before the first setting. The strength at one month gradually rose to 116 lbs. per square inch with mortar which had been mixed for seven days, and fell when the mortar had been standing for eleven days to 83 lbs.

Summing up in conclusion the results of a fairly exhaustive series of tests, so far as the limits of the experiments extended, the author said it seemed certain that the strength of a mortar depends far more upon the physical character of the materials employed than has hitherto been fully realised. If the usual prescription of three to one be rigidly adhered to, the mortar may have in certain cases only one-third of the strength of that which might be obtained with as widely varying proportions as five of sand to one of lime; and it would appear to be desirable that the strength as ascertained by crushing should be the criteria rather than by arbitrary proportions. The tests can be made with great facility, and should be employed in all cases. The author said he must not be taken to

suggest that any and every admixture should be sanctioned; but where the materials are clean and sound and free from dirt (such as unwashed road sweepings, dustbin refuse, old mortar, &c.), no unreasonable objection should be taken to their use provided that they yield a mortar having strength sufficient for the work in hand. If a factor of safety of five were sufficient for any work, it was obviously unnecessary to ask for one of ten, as the strength upon that basis must necessarily increase with the increment of the load. On the other hand, care should be exercised to secure such factor of safety as may be required in any particular case.

It was a common practice to add to the sand hard clinkers crushed in a mill, sometimes in even equal quantities. Experiments conducted on the same lines as those described by the author confirmed the general conclusions in regard to fineness—varying quantities of sand and grit to lime, &c.—and show that mortars made with good hard clinker and sand may be used with safety.

Mr. H. D. SEARLES-WOOD proposed a vote of thanks to Mr. Dibdin for his paper, and said that as far as he knew there were no published results of experiments with lime upon sand, although the experiments on cement and clay and sand have been published. Mr. Dibdin had certainly made important tests, but the speaker wished to see the experiments carried a great deal further, in order that they might have more confidence in the methods of investigation and more assurance in the results obtained. He hoped therefore the author would carry out his experiments in further detail, and at the same time he suggested that, inasmuch as the question was important to all people, there should be an obligation on the part of authorities such as the London County Council or the borough councils, to instruct chemists to conduct series of experiments on the local materials in a district, so that the results of the tests would be available for those who were about to undertake building operations.

Mr. W. WOODWARD seconded the vote of thanks, and remarked that he would like to see more practical experiments than laboratory ones undertaken. First of all, the tests might be made on walls, and they should be able to ascertain the strength of mortar under varying conditions, such as that made up with washed sand. Then they might test a similar wall as the first, the mortar having been made up with unwashed sand. There was also the effect of frosts on various mortars to be investigated. Practical experiments of that sort he considered would be of real importance to architects in their work.

Mr. MAX CLARKE said the paper was just what they wanted at the present time, because he believed the average architect when he put the clause in his specification which dealt with the composition and standard of mortar, satisfied himself with the old average and did not exercise that supervision which was essential for good work. He thought there was need for further experiments, and therefore proposed the following resolution:—"That this meeting is of opinion that the composition of mortar is a matter which deserves the fullest consideration, and with that end in view the Council be asked to devote a sum of money for further inquiry into the subject."

Mr. A. E. MUNBY, in some remarks upon the paper, said the chief difficulty in drawing conclusions from Mr. Dibdin's interesting experiments appears to lie in the very large number of variable factors which are involved. The initial hardening of mortar depends probably for the most part upon (1) the extent of compression in the mass such as may be caused by changes of volume produced on solidification, (2) the amount of evaporation which will result in a contraction varying with the nature of the constituents, (3) the solidification attained, (4) the character of the crystallisation decided by the nature of the crystalline constituents, the quantity of water present, the solubility of the ingredients, their initial temperature and the thermal disturbance caused by chemical reactions, (5) on the time of setting which puts a limit to the motion of the particles in solution. Again, the final strength attained must be governed by the cohesion of the particles, which will of course vary with their composition, and by the area of surfaces of different constituents in contact, their chemical nature, grouping and interspaces, in short, by what is called adherence. Is it rational to expect that among such a wealth of variables any scientific results can be drawn from experiments which attempt to embrace so many simultaneously? In the first place, we do not even know whether any chemical action takes place between the lime and the clay added to the sand. It may seem improbable

that clay, the last resisting remnant of disintegrated felspathic rocks, which has in a minute state of division been suspended for so long in water (alkaline at least initially) should be soluble enough to react with lime during the short interval before the tests. Nevertheless, some recent experiments on American waters show that silica is more soluble than is generally supposed. One would like to see some experiments undertaken on less ambitious lines to begin with. For example, the clay might be replaced by something entirely above chemical suspicion, such as platinum in a similar state of division. Again, a further effort might be made to separate chemical and physical effects by imitating experiments on adherence with fat lime mixtures. Briquettes of lime and shot in place of sand might lead to some information as to the effect of configuration and size of particles, which would then be under control. Something in the nature of a fat lime constant for subsequent deduction might possibly result. As to the setting of mortar when reworked, the supersaturation theory of Le Chatelier and Marignac provides an explanation. These savants have shown that many bodies added in excess to water form supersaturated solutions which deposit crystals after a small interval. As much lime remains unaltered in ordinary mortar, there seems no reason why when ground supersaturation should not again occur on remixing. The subsequent loss of strength after a longer interval might be due to the formation of compounds which would be less soluble than lime, and would consequently produce less concentration in their supersaturated solutions if the rate of setting is not proportionately increased.

Mr. W. D. CAROE seconded the resolution proposed by Mr. Max Clarke, for he said he felt there was a vast amount of knowledge to be acquired on the subject of mortars, and the Institute was the body to acquire it for them. The paper had told them of experiments with mortar a few days after it had been made, but he wished to know what variation there would be in mortar after some years. He generally came to the conclusion, after an inspection of old buildings, that the mortar made in the nineteenth century was not to be compared in excellence with the mortar made in the centuries which preceded it. He had found mortar made in Sir Christopher Wren's time better than that made in the last century, and he believed the reason was that the men who made mortar on the earlier buildings were definitely trained craftsmen who mixed the materials together in traditional proportion.

The PRESIDENT put the resolution to the meeting and it was carried unanimously.

HOLYROOD TAPESTRIES.

IN the beginning of the present year the Duke of Hamilton, as is known, gave up the control of certain rooms in Holyrood which his ancestors, as hereditary keepers of the Palace, had enjoyed for many years. On the Office of Works proceeding to clear out the rooms they found, says the *Scotsman*, among other things, a charter chest of the Hamiltons, which was handed over to the legal representatives of the Duke. At the same time there were discovered in the same rooms ten beautiful pieces of tapestry carefully stored away, which on being exposed to view were found to be in good order. The Office of Works claimed them on behalf of the Government, and the Duke for himself. Mr. Oldrieve, on going carefully into the matter, speedily solved the mystery of the tapestries. It appears that in 1850, on the occasion of a visit to Holyrood of Her late Majesty Queen Victoria, accommodation was required for her maids of honour and superior servants. A large tapestried room was accordingly requisitioned for the purpose, but as it had to be divided into three by wooden partitions, the tapestry on the walls was taken down and stored in the rooms under the control of the Duke of Hamilton. There for fifty-five years these valuable works of art have lain undisturbed. As the Duke, however, would not renounce his claim to the tapestries, an arbitration was opened and evidence taken on the subject. Sir Herbert Maxwell was appointed arbiter, and he has just given his decision, awarding the tapestries to the Government. For this result the Scottish public have to thank Mr. Oldrieve, for the care he bestowed on the investigation of this subject has made the ownership clear. The tapestries are Flemish of the seventeenth century, and are of a highly decorative character. Several of the pieces have figure subjects, others are scenic, others architectural, but all are artistic and valuable.

In connection with this find a project has been mooted,

and has received favour in official quarters, that the tapestries should be employed in decorating the large picture-gallery of the palace. In that case the present fictitious portraits of the kings of Scotland would be removed to another part of the palace, and the tapestries arranged in a series of panels on the walls. There is quite enough of them to cover in this way not only the wall opposite the range of windows, but the two ends, and if the present plain, whitewashed roof were decorated in an adequate manner to match, the result would be a hall of something like regal splendour. The portraits, 110 in number, which it is proposed to transfer to other quarters, were executed under a contract, dated February 26, 1684, between Hugh Wallace, His Majesty's cash-keeper, on the one part, and "James de Witte, painter, indweller in Canongate," on the other, whereby the said James "binds and obleidges him to compleatly draw, finish, and perfyte the pictures of the haill kings who have reigned over the kingdome of Scotland from King Fergus, the first king, to King Charles the Second, our gracious Sovereigne, who now reignes inclusive, being all in number one hundred and ten; and to make them like into the originalls, which are to be given to him." It was further stipulated that the pictures were to be finished "in large royall postures," within two years, the artist's fees being at the rate of 120*l.* per annum. In an official guide to the palace, just issued by Blackwood, with a historical sketch by Sir Herbert Maxwell, Bart., it is said:—"Originally in hanging frames the canvases were badly slashed by the sabres of Hawley's dragoons, who, having been routed by Prince Charlie's Highlanders at Falkirk on January 17, 1746, vented their ill-humour on these works of art. The pictures were subsequently removed from the frames, repaired and fixed in the panels of the wainscoting. Part of De Witte's duty was to inscribe each portrait with the name of the subject, 'the names of the kings most famous in large characters, and the remnant in lesser characters.' All the likenesses and many of the very names of the earlier monarchs are fictitious; others represent the kings of the various divisions—Pictish, Scottish, Cumbrian and others—which were not consolidated into a single realm until under Malcolm II."

Sir R. Rowand Anderson architect, gives the following account of the discovery:—"You have a notice in to-day's *Scotsman* of the accidental finding about one year ago of ten pieces of tapestry in the Duke of Hamilton's rooms at Holyrood. This tapestry was discovered, if such a word may be used, in the year 1895. At that time I was carrying on the Applied Art School, one department of which is known as the National Art Survey, and I had to find winter work for the two students who held the scholarships. Holyrood seemed to be a likely place, and permission was obtained from the Lord Chamberlain for access to the royal apartments on the south and east sides, from the Board of Works for access to Queen Mary's apartments, and from Mr. J. Auldjo Jamieson, W.S., for access to the Duke of Hamilton's apartments. In each case permission was given to make drawings of whatever I thought of national interest or artistic merit.

In searching the Duke of Hamilton's rooms I came upon a number of pieces of old furniture, covered with dust and piled in some cases one on the top of the other, many of the pieces broken, and all having the appearance of having been neglected for years, but I saw that they were of great value in the history of furniture. In one room I came upon a pile of what I at first thought were old carpets, but on turning them over I found that they were tapestries. There were also a number of old engravings in fine old thin black frames, all of them more or less damaged. I represented to Mr. Auldjo Jamieson the value of these things, and that proper care should be taken of them. At that time it never occurred to me that these did not belong to the Duke of Hamilton.

Some time after this they were advertised for sale at Dowell's rooms in George Street, on Saturday, February 18, 1899, and were on show there. Mr. Sands, who had charge of the royal apartments at Holyrood, and who is now inspector at Buckingham Palace, with whom I had several conversations regarding them, had communicated with the authorities, and the question of ownership having been raised, the sale was stopped and the articles brought back to Holyrood, the Crown and the Duke of Hamilton each maintaining a claim to them.

As soon as I knew there was a dispute as to the ownership, I represented to Lord Esher, then the secretary of the Board of Works, their great artistic value, and that they ought to be secured for Holyrood. His Lordship took a

keen interest in the matter but was not able to get the question settled before he left the Office of Works.

I spoke to many others, who were able to urge the authorities not to allow these things to be removed, and specially pressed the matter on the attention of Lord Esher's successor, Sir Schomberg M'Donnell, who took the matter up warmly, and I believe it is mainly due to his exertions that the dispute as to ownership has been brought to a settlement.

I think the public are greatly indebted to Mr. Oldrieve, of the Board of Works, for the careful way he got up the case for the Crown.

The question of the ownership of the furniture is, I suppose, not yet settled. The furniture is of great artistic value and ought not to be allowed to leave Holyrood, even if the Crown has to secure it by making a payment to the Hamilton family.

The engravings I refer to were exhibited at a conversation at the Architectural Association in November 1895.

The drawings of the old furniture and of the magnificent plaster ceilings and woodwork in the royal apartments are deposited in the library of the National Art Survey Department of the Applied Art School, Royal Institution, and are of great interest and value to art students.

NORTHERN ARCHITECTURAL ASSOCIATION.

AT the last meeting of the Association, Mr. G. A. T. Middleton (vice-president of the Society of Architects) delivered a lecture on "Continental, Romanesque and Gothic Detail." In the course of his lecture Mr. Middleton said the development of architectural detail from the period of the Norman Conquest until the time of the Reformation, as it occurred in England, was well known to every English architect, forming part of his necessary education. That there was a similar development upon the Continent was equally well recognised, but as the continental forms do not so greatly influence modern English practice, they had not as a rule been so closely studied, particularly as to do so required personal contact with the buildings of other countries, such as was only to be properly obtained at considerable expenditure of time and extensive travel, while even then so little had been written upon the subject that it was only slowly that the various phases of change fell into their right places. The English forms were distinct to themselves in many respects, due to an entirely different inspiration from that which influenced continental work; and to properly consider the latter it was necessary to temporarily wipe out of one's consciousness all preconceived ideas, and to start, as it were, afresh, as if their insular work were non-existent. Like the English, however, the early Romanesque of the Continent had a Roman origin, but it was much more closely allied to its original. There seemed to have been two streams of influence which followed the two main trade routes into North-Western Europe—one along the Rhine, passing northwards as far as Cologne, and then spreading out like a fan across North France and Germany, and the other traversing the South of France and gradually spreading northwards through Poitou and Berri to the Ile de France. The former stream was much more nearly allied to the Roman than was the latter. In the doorways of Mainz Cathedral, and in many other examples, they formed the Corinthian capital in an exceedingly pure form, though it was often used to carry an archway arranged in orders or stages, either unmodelled or enriched with mere rolls at the angles and shallow hollows on the main faces, such as were employed in the early Norman period in England. Arches of the same character were found in the South of France, but the detail of the carving was more Byzantine in type than Roman—i.e. cut down by incision below the general surface of the stone rather than with projecting leaves and volutes, and showing a less appreciation of the use of the chisel and more of the drill. In the north-west of France those two types coalesced, forming what was known as Norman, there being super-added another influence, namely, that of the Scandinavian pirates, who ravaged the whole coastline. The result was the production of an architecture whose details were of a mixed character, the classic origin being often difficult to discover beneath the Scandinavian overlap of billet or chevron, representing embroidery stitches, or of grotesque animal sculpture, or of forms suggestive of twisted wirework. Towards the end of the twelfth century, when the whole spirit of architecture changed and Gothic replaced the Norman of England and the

Romanesque abroad, they were accustomed to recognise a similar change in the detail, particularly in the matter of mouldings. This was, however, essentially English, and it was at first a surprise to the English student to find that the mouldings of France and of Germany scarcely altered from their Romanesque character until the end of the fourteenth century. The deep undercutting of our beautiful Early English period was unknown in France, save in a few instances where the English influence was paramount. It was much the same, too, with the foliage carving, though in a different degree. It was never so profuse either in France or Germany in the earlier periods as with us, nor of so light and delicate a nature, yet in the thirteenth century it was there representative of the foliage of spring, just as it was with us in England. Our fine rising stem, however, was unknown, but was replaced in the capitals by a broad leaf, like that of the hart's-tongue fern, not yet completely open, and consequently ending with a cluster instead of a point, while in continuous enrichments a large flowing scroll was commonly employed, evidently based in general scheme upon the Roman model, an entire moulding being often thus enriched in place of the foliage lying in a hollow, and having an almost invariable vertical tendency, as with us. In course of time the spirit changed, and the leaves of summer superseded those of spring. This is representative of the fourteenth century, but the undercutting is not often carried to excess, or one might almost say is at present non-existent, the work, whether it be in panels or on capitals, being in low relief, though wonderfully true to nature. The gradual change from spring to summer, and again from summer to autumn, which occurred equally in England, could scarcely have been premeditated, though it was exceedingly interesting to trace, until in the later work of France they find an extreme elaboration and delicacy of treatment, as if the masons had at last acquired the full living Gothic spirit, revelling in the beauty of natural forms and in delicacy of execution. Undercutting was often carried to excess, and the bare, gnarled bough of winter would sometimes appear amidst the decaying leaves and fully ripened fruit. Further eastwards, in German territory, two types of work were found in this period, one exceedingly powerful and even heavy, while the other was thin and wiry to excess. Contemporaneously with this development of a new spirit came the evolution of true Gothic mouldings, the work of the French Flamboyant period in particular being original, and as richly cut as English work of the thirteenth century, entirely different from the flat and lifeless "perpendicular" mouldings to which ours had degenerated by this time.

In the course of the evening Mr. A. B. Plummer (honorary secretary) read out the assessors' award in connection with the measured drawings and sketches competitions. Premier honours in the two competitions respectively were secured by Mr. H. M. Spence (North Shields) and Mr. Wm. Riddle (Newcastle), Mr. H. L. Hicks (Gosforth), and Mr. T. W. Milburn (Sunderland) occupying the second places.

THE ROMAN STATION AT NEWSTEAD.

AT the first monthly meeting of the Society of Antiquaries of Scotland for the present session, a preliminary report on the excavation of the Roman military station at Newstead, Melrose, was given by Mr. James Curle, illustrated by a plan of the buildings made by Mr. Thomas Ross, architect, and by many lantern views of the objects found. The excavations, which have been carried on under Mr. Curle's superintendence without intermission since February 1905, have been successful beyond the most sanguine anticipations. The foundations have been traced of the largest military station yet investigated in Scotland, very strongly defended by a rampart of earth 40 feet thick, faced by a well-built wall $7\frac{1}{2}$ feet in thickness and protected by three parallel lines of ditches. The interior is laid out much in the usual manner—the commandant's quarters, the Pretorium, with its pillared courtyard and narrow buttressed stone buildings, along the principal street fronting to the east, and behind them a series of lines of long, narrow barrack buildings, of which six lay to the north of the main road leading to the east gate and six to the south. A peculiarity of the Newstead plan is that each block is divided into eleven separate buildings, about 30 feet by 15 feet. The things found in the barrack area include a fine bronze ewer, 11 inches in height, with a beautiful handle terminating above in a lotus bud, with arms shaped like

long-beaked birds grasping the rim, and below in a Bacchanal head, with ivory tendrils wreathed in the hair. The type is well known in Pompeii, and belongs to the first century. There were also two Samian ware bowls, one bearing the stamp of Cinnamus, a potter of Lezoux, in the Antonine period. In the block north of the Pretorium was a well 19 feet deep, from which were recovered a quern of Andernach lava, a copper kettle, two spear-heads and pottery. The Pretorium presented evidence of alterations, including the addition of a vault or strong-room beneath the floor of the central chamber and a large hall thrown out in front, extending over the Via Principalis. This hall has been met with in the Roman forts in Germany, but not hitherto in Britain. Beneath the floor level of the earlier Pretorium a still earlier occupation level was observed, from which came coins of Mark Antony and Vespasian. In the field outside the area of the fort, to the southward, fourteen pits were discovered, varying from 10 feet to 30 feet in depth, containing at the bottom a deposit of black mud, from which many objects of great interest were obtained. Chief among these is an iron helmet with face-mask, the headpiece embossed with locks of curling hair; a helmet of brass richly embossed with figures in high relief, an iron helmet without decoration, shoulder-pieces and elbow-pieces of bronze armour bearing the name of the owner scratched on the inside, eight circular and one heart-shaped plates of bronze, also bearing a name scratched on the inner side; two iron swords, five spear-heads, four pioneers' axes and a quantity of smithy tools and other tools of various kinds; two chariot wheels and twenty-nine hub-rings of similar wheels; four scythes, pieces of leather clothing, boots and shoes and many articles of use or ornament. The results obtained during the year encourage the hope that further finds of great importance may be made if the necessary funds are forthcoming to complete the investigation of the interior of the fort and of the annexe on the west, in which is the site of a large well-built building, probably the baths. Other problems in connection with an annexe to the east, and with the several occupations of the site as a whole, also remain to be dealt with. The skulls of horses found in the pits have already formed the subject of an important communication by Professor Cossar Ewart to the Royal Society.

SHEFFIELD SOCIETY OF ARCHITECTS.

A PAPER was read by Mr. J. B. Mitchell-Withers before the Sheffield Society of Architects and Surveyors on "Brickwork." He commenced by a brief reference to the ancient use of plastic materials and sun-dried bricks, leading up to the introduction of Roman bricks or tiles, which were of large size but only about an inch thick, and thence to the bricks of to-day. He also referred to the importance of good mortar and the bonding of the brickwork. After referring to some of the early brickwork in England, illustrated by slides of Hurstmonceaux Castle, Tattershall Castle, Hampton Court and various other buildings, he showed the use of brickwork by the Dutch, and how they introduced stone into their work at points where strength is required and emphasis is needed by the design, generally using it, however, in a sparing manner, especially in domestic buildings. The characteristics of these buildings were such as became a Northern type: high-pitched roofs and ornamental gables, with bold chimneys, being seen both in the domestic buildings and in the towers and public buildings. To show the use of brickwork under entirely different conditions, illustrations were shown of many buildings in Italy, where brickwork forms the main structure, and terracotta, stone, or more frequently marble, is used in conjunction with it. Where marble is used as a facing, the lecturer pointed out that the idea is to use it in just the opposite way to that in which the stonework is used in Holland, namely, for filling in spaces on which there is no special weight or strain, though in some cases the brickwork has been entirely cased in it. After referring to the types of tower used in Italy, a few slides of modern buildings in which brickwork is employed were shown.

Mr. Claude Phillips, keeper of the Wallace Collection, has presented to the Tate Gallery Fred Walker's poster for Wilkie Collins's novel "The Woman in White," representing a woman in a cloak at night. It has been placed in Room VIII.

NOTES AND COMMENTS.

THE notorious HUMBERT case would not appear to be at an end, for a case arising out of it is now before the Paris courts. In the Salon of 1890 there was a picture entitled *Louis XIII. et Mdle. de Hautefort*; it was described as the work of FREDERIC HUMBERT, pupil of CAIN and ROYBET. Recently a lover of art bought some paintings from a dealer, and among them were two called *Bénédiction à la Cour* and *Richelieu attendant le Roi*. It was not long before the purchaser was informed by his friends that the two when combined formed the picture exhibited in 1890. It was afterwards discovered that they were the work of M. ROYBET, one of the cleverest of modern French painters. It appears he used to give lessons in painting to FREDERIC HUMBERT, and that he sold several pictures to the family. Madame HUMBERT informed the artist that her husband was ambitious to be recognised as an artist by having a picture in the Salon. She offered M. ROYBET 4,000*l.* if he would co-operate in the project, and finally he accepted the offer. It is needless to say he did not receive a penny of the 4,000*l.* His picture, signed FREDERIC HUMBERT, was contributed, and obtained a third-class medal. A dealer afterwards obtained the painting for 6,000 francs, and gave M. ROYBET 5,000 francs to work it up. The painter considered it was too large for the ordinary market, and he therefore proposed to make two pictures out of it. He declares in the most formal manner that no other hand has added a stroke to the work. M. ROYBET possesses the sketches and studies he made and he has furnished the Court with the names of his models. M. HUMBERT, however, declares that the idea of the painting was his; that he entirely composed it; that while engaged in painting it M. ROYBET advised him and introduced some strokes occasionally; but otherwise M. HUMBERT claims to be the author. We should imagine that the judges will not find much difficulty in deciding about the artist to whom the dual picture is to be ascribed.

ARCHITECTS are not alone in wishing to have some participation in the works carried out by public authorities. A meeting of the Fellows and professional Associates of the Surveyors' Institute was recently held, in order to consider the advisability of drawing up a scale of charges for the preparation of bills of quantities for building works undertaken by public authorities, and of publishing the same under the authority of the Institution; secondly, to elect a sub-committee to draw up the scale, and to submit the same to an adjourned general meeting of members; and thirdly, to consider any further or alternative proposals for taking action in reference to quantity surveyors' fees. Many members took part in the discussion, but a majority considered that a scale of charges on the lines indicated was inadvisable.

DURING the past year the Commissioners of Public Works of Ireland found it necessary to put in hand the reparation of seventeen ancient and twenty-three national monuments. The more important were the completion of the repairs at the French church, Waterford; the removal of ivy roots from the masonry of Kilcrea Abbey, co. Cork, preparatory to securing the walls; and the removal of ivy and the protection of the walls and slabs at Rathmichael Church and Round Tower, co. Dublin. Initial repairs were put in hand at St. John's Church, Hospital, co. Limerick. Of the national monuments repaired the most interesting is Holycross Abbey, co. Tipperary. Important works of repair were carried out at St. Francis's Abbey at Kilkenny, where the tower for a considerable time has been somewhat insecure. It was supported by metal columns erected by local effort before it was vested in the Commissioners, and timber centring has since been placed under the arches where the stonework showed symptoms of yielding. The east window of

seven lights divided by very slender mullions also required attention, as the ivy was spreading over it and into the joints. Both tower and east window have had the necessary repairs executed, but the latter, from its construction and the difficulty of supporting it (except by building up the openings in solid masonry, which would spoil the beautiful appearance of this singular window, and is not to be recommended), will require constant attention. At Inchcleraun (Quaker Island), Lough Ree, near Athlone, the repairs which were commenced last year have been completed, and for the better protection of the churches on the island wrought-iron railings have been erected around them to keep out cattle. Some repairs were executed at several of the ruins at Glendalough. The stone roof of St. Kevin's "Kitchen," through which rain had commenced to percolate, was repaired and stanchied. The walls of "St. Mary's Church" and the "Cathedral" were repaired by removing the vegetation and pointing the masonry in cement, and the Monastery of St. Saviour's had the tops of the walls secured to prevent rain entering. Under the provisions of the Irish Land Act, 1903, the Land Commissioners may, with the consent of the Board, vest in them any ancient monument possessing historic, traditional, or artistic interest, situated on lands sold under the Act, and if the Board decline to accept the custody of the monument it may, with the consent of the Council of the county in which the monument is situated, be vested in that body. During the past year twenty-six cases have been brought under the Board's notice by the Land Commissioners, and after examination one case only—viz. Ballyboggan Abbey—has been considered of such a character as to admit of the Board accepting guardianship.

DESIGN FOR THE PEACE PALACE, THE HAGUE.

THE designers in their endeavour to separate the library from the courts, in accordance with the instructions to competitors, devised it in the form of a semicircular plan with a connecting corridor. This arrangement allows of very equable lighting on the curved side, aided by tall windows in the wall at the straight side.

The courts are arranged to the right and left of a central domed hall, which has the grand staircase rising from it to the upper floor. On this upper floor the most important apartment is the council-room, which is near the great staircase and over the corridor of communication between the court blocks and the library. A quiet phase of Classic architecture has been chosen as most in harmony with the sentiment and purpose of the building. The design was prepared by Mr. G. S. AITKEN and Mr. H. F. KERR, architects, Edinburgh.

GRANTSWOOD, HORSHAM.

THE ORCHARD, CHORLEY WOOD, HERTS.
HOUSE ON THE HOG'S BACK, NEAR GUILDFORD, SURREY.
PERRYCROFT, COLWALL, HEREFORDSHIRE.
HOUSE AT CASTLEMORTON, WORCESTERSHIRE.

WE illustrate this week some examples of Mr. C. F. A. VOYSEY's work. The house Perrycroft, Colwall, Herefordshire, for Mr. J. W. WILSON, M.P., is built of brick and rough-cast, with stone dressings, iron casements and Westmoreland green slates to roof; the inside woodwork is all of white enamel. The house at Castlemorton, for Mr. R. H. CAZALET, is brick built, with rough-cast and roof of red tiles. The others given are Norney, Shackleford, near Godalming, Surrey; The Orchard, Chorley Wood, Herts; house on the Hog's Back, near Guildford, Surrey.

THE architects for the Baptist church, Shooter's Hill Road, Blackheath, are Mr. SAMUEL S. DOTTRIDGE, A.R.I.B.A., in connection with Mr. WILLIAM J. WALFORD, A.R.I.B.A.

SERIES No. 1
CHESTER: THE CHOIR, WESTWARDS

THE LONDON COUNTY HALL.

THE instructions to competing architects for the new county hall and offices have been prepared by the establishment committee of the London County Council. The building which it is proposed to erect will be on a site bounded by the river Thames, Belvedere Road, Westminster bridge and the Council's works department, offices and depot.

1. The competition will be divided into two stages, viz. (a) the preliminary; (b) the final. The preliminary stage will be open to architects of any nationality.

2. In the preliminary stage the professional assessors will select in private not less than ten nor more than fifteen designs. The authors of the designs selected by the assessors in the preliminary stage, together with eight architects invited by the Council, will compete in the final stage.

3. The eight selected architects will be required to send in designs at the date fixed for the delivery of the final designs of the architects selected as the result of the preliminary stage of the competition (see clause No. 18).

4. The designs of the successful competitors will be returned on the completion of the adjudication in the preliminary stage, to enable their authors to compete in the final stage.

5. Each architect submitting a design for the final stage, in accordance with conditions, will receive an honorarium of 200 guineas (210*l.*)

6. The Council has appointed Mr. Norman Shaw, R.A., and Mr. W. E. Riley, F.R.I.B.A., the official architect, to act for it in this competition as its professional advisers and assessors, to draw up the instructions and to select and recommend to the Council the architects who have sent in the designs which in their opinion are the best of those submitted, both in the preliminary and final stages of the competition.

7. These two assessors will be further assisted in the final stage of the competition by a third assessor who will only act in that stage. This assessor, who will be nominated by the competitors in the final stage of the competition, will be required to give an undertaking that he did not participate in the preliminary stage of the competition.

8. It is the intention of the Council to assign to the author of the design placed first in the final stage the work of carrying out his design, and the Council has decided that Mr. W. E. Riley, the official architect, shall have discretionary power in all matters relating to internal economy, building construction and stability. The successful architect shall obtain all the information he requires upon the site, making the necessary estimates, preparing all the necessary sketches, working drawings, detail drawings and specifications subject to the Council's approval in all matters which in the opinion of the official architect should be brought to it for decision. The successful architect shall prepare all the necessary copies of the drawings and documents for the proper execution of and use on the works, and also the drawings, &c., for the records of the Council, and exercise in conjunction with the official architect general and usual superintendence of works during progress, examine and certify the accounts for the works and payments under the contract.

9. For these services the successful architect and the Council's official architect will be remunerated on the basis of the usual 5 per cent. on the total cost of the completed building other than the work connected therewith which will not devolve on the successful architect, and this commission will be paid in the usual manner and will be divisible between the two architects in the proportion of nine-tenths to the successful architect and one-tenth to the Council's official architect.

10. The buildings may at the discretion of the Council be erected in successive blocks, but no special liabilities for extra payment shall accrue through this cause.

11. The Council will employ one or more of the firms on their own list for preparing the quantities, whose fees and the lithography charges will be defrayed by the Council.

12. A clerk of works or clerks of works will be employed to superintend the work at the expense of the Council.

13. Should the building from any cause not be erected within a reasonable time after the two competitions shall have been held, the author of the selected design will be paid at the rate of one-fifth of the commission to be given for his services, the basis being his estimate of the whole

cost, such amount to form part of the commission if the building is erected from his design.

14. Any competitor sending any drawings, photographs or statement of any kind in reference to his design, or giving any clue to his identity to anyone directly or indirectly connected with the Council or its administration, to the assessors or the public, until after the award of the assessors in the final stage shall have been officially announced, will be disqualified. The special attention of competitors is called to this condition.

15. Designs will be excluded from the competition:—

(a) If sent in after the time fixed for receiving the designs, &c. (b) If considered by the assessors as not in strict accordance with the instructions. (c) If they do not provide substantially the accommodation asked for. (d) If they exceed the limits of the site. (e) If the assessors should determine that the probable cost of the buildings will materially exceed the outlay stated. (f) If any competitor attempts to make known his identity or to influence the decision personally or through any member of the Council or the assessors.

16. The drawings submitted in the preliminary stage of the competition will be returned under seal to their respective authors after the award, and, with the exception of the assessors, no one else (pending the final award) will be permitted to see the drawings under any circumstances during the time they are in the keeping of the Council.

17. The successful competitors in the preliminary stage of the competition, if they so desire, can amend or redraw their designs for the final stage of the competition.

18. Four calendar months will be allowed from the date the drawings are despatched to the successful architects in which to complete their matured schemes, at the end of which time both the eight originally invited architects and those who won their position in the preliminary competition must deposit their final designs; the precise time and a date will be named by the assessors.

19. The accepted design will become the property of the Council, which reserves to itself the right of exhibiting the other designs sent in for the final stage of the competition for a limited time after the final award shall have been made.

20. All schedules, reports, writings on drawings and scales are to be in English.

21. Each design, report, schedule, packing-case, label, &c., must be unsigned and without distinctive mark of any kind, and all documents must be typewritten or printed. There must be enclosed with the documents, &c., a sealed envelope (supplied by the Council) containing the name and address of the author, and these will be numbered as they are received.

22. An adhesive printed label, addressed to Mr. W. E. Riley, superintending architect, County Hall, Spring Gardens, London, S.W., will be supplied with the conditions of the competition. This label must be affixed to the package containing the designs, reports, schedules, &c., and must be delivered at the competitor's own expense on or before noon on Tuesday, May 7, 1907. The time stated above for sending in the designs will not in any circumstances be extended.

23. Every care will be taken of the drawings and any other documents sent in by competitors, but the Council will not be responsible for any loss of such drawings or documents or any injury or damage such drawings or documents may sustain whilst in its possession.

24. The land edged green on the block plan is reclaimed foreshore. An embankment wall will be constructed by the Council to a height of 18.00 above Ordnance datum, which would be the level of the surface of the embankment. The competitors will be required to include in their scheme a design for the superstructure of this embankment wall, which is to be of granite. They are to estimate separately for this superstructure and facing the wall with granite from 2 feet below low-water level (which is minus 6.00 Ordnance datum), also for all steps and ornamentation in connection with this wall required to complete their design.

25. A block plan, showing the site of the proposed buildings, accompanies these instructions, giving the levels of the site and environments above Ordnance datum, which for the purposes of this competition may be taken as correct. The whole of the buildings must be provided within the area edged pink. Belvedere Road is to be widened to 50 feet between the buildings, and, as set out in an agreement between the Council and the freeholders on the east side of Belvedere Road. A copy of the clause to be observed is appended (Schedule "D.")

26. For the information of competitors the site shown on the block plan is contained on the two London Ordnance sheets, Nos. VII. 83 and VII. 84, scale 88 feet to an inch; these can be obtained from Messrs. Stanford & Co., Long Acre, London.

27. A sketch plan of the proposed first floor is attached, which shows a suggested arrangement of the accommodation on that floor, but it is to be regarded as merely a suggestion which competitors may modify in any way they desire.

28. A schedule of provisional requirements is included, giving the several departments to be accommodated, their approximate positions in the general scheme, the names and numbers of the rooms, &c., and their approximate areas; but these requirements are subject to revision.

29. Elevations of the London County Council works department workshops, which are on the north boundary of the site, are also supplied for the convenience of competitors, but it is thought very desirable that each intending competitor should visit the site before preparing his design.

30. In considering the designs the greatest importance will be attached to simple and convenient planning, and it is essential that all parts of the buildings should be amply lighted. The construction is to be fire-resisting material throughout.

31. Attention of competitors is invited to the London Building Acts, 1894 to 1905, with which the construction of the building should conform.

32. The hall provided in the schedule is to be planned as to means of exit, &c., in accordance with the requirements of the London County Council Theatres Regulations.

33. The choice of materials to be used for the building will be left to the discretion of the competitors.

34. The sum of 850,000*l.* is considered sufficient to provide a substantial structure suitable for the Council's purpose, exclusive of embankment superstructure and furniture, also of any special foundation which may be necessary.

35. The site will be covered with a concrete raft, the upper surface of which will be at a level of minus 3.00 Ordnance datum, and upon this raft the footings of the superstructure must rest. This concrete raft will be constructed by the Council.

36. Each competitor must accompany his design by a short typewritten descriptive report in duplicate giving all information that may be considered necessary by the competitor to fully explain his design.

37. This report is to be accompanied by a typewritten schedule in duplicate giving the areas of the accommodation apportioned to each department on each floor, and showing (1) the area of office floor space; (2) the area of space devoted to waiting-room, storage, &c.; (3) a description of the material and mode of construction proposed to be adopted, the cubic contents of the building (such cube to be taken from minus 3.00 Ordnance datum to the ceiling of the topmost storey), to include all architectural features, &c. A copy of the dimensions in which the cube is based, and an approximate estimate of the cost of carrying out the design must also be supplied, together with the detail basis of their estimate, and if the value is priced at per cube foot the authority for this price is to be quoted.

38. Open fireplaces are to be provided in the principal rooms, in addition to which the whole of the building is to be heated by radiators. A system of mechanical ventilation is also to be provided. Accommodation to be shown on the plans submitted for the necessary plant for both systems.

39. The object of the first stage of the competition being to obtain a good design and general scheme, full details of the construction and heating arrangements need not be shown, but the general proposals for the heating and ventilation should be described in the report, together with any other points competitors may consider necessary for the proper illustration of the scheme, but all schemes sent in at the final stage of the competition must show the intention in regard to heating and ventilating the various parts of the building.

40. The competitors are to tint the areas on each floor allocated to the various departments as shown in the following schedule, the shade of colours given to be adhered to as closely as possible.

(Here will be inserted Schedule "A," showing the shade of colours to be used in indicating the location of the departments.)

41. Each plan is to have clearly marked thereon the areas of all the rooms and also a schedule of the areas apportioned to each department in the bottom left-hand corner.

42. Each design must be accompanied by a declaration, signed by the competitor, stating that the design is his own work and that the drawings have been prepared under his own supervision, in his own offices and by his own staff. The declaration must be enclosed in the before-mentioned sealed envelope.

SCHEDULE B.—Approximate Areas of the Principal Rooms.

Council chamber, 4,000 super feet; lobby for "ayes," 650 super feet; lobby for "Noes," 650 super feet; committee-rooms, 600, 900, 1,000, 750, 900, 1,200, 600, 1,000, 850, 1,200, 850 and 850 super feet; chairman of Council, 550 super feet; secretary, 300 super feet; waiting-room, 550 super feet; deputy-chairman, 550 super feet, and vice-chairman, 550 super feet.

Suitable accommodation, amounting in the aggregate to an area of 16,000 square feet, for the general use of members. The library, which shall be as conveniently situated as possible to the Council chamber, and a hall to seat 800 persons is to be provided. The whole of the principal floor is to be devoted to the accommodation as set forth in this schedule, and to the accommodation of those heads of departments (as set forth below) who should be located as near the committee-rooms as possible. Such accommodation should consist of a large room about 500 super feet for head of department, a small waiting-room and also about three rooms of approximately 350 super feet each. These areas are not to be included in areas required by the undermentioned departments.

Heads of departments, &c., to be accommodated on principal floor:—(1) Clerk of the Council, (2) comptroller, (3) chief engineer, (4) architect, (5) solicitor, (6) medical officer of health, (7) valuer, (8) statistical officer, (9) chief officer of the fire brigade, (10) manager of works, (11) chief officer of tramways, (12) educational adviser, (13) executive officer, (14) chief inspector.

SCHEDULE C.—List of Drawings.

The whole of the drawings in the preliminary stage of the competition are to be drawn to a scale of 16 feet to 1 inch, with the exception of the site plan showing the block plan of the new building in relation to the immediate surroundings drawn to a scale of 40 feet to an inch. Preliminary stage of the competition—plans of each floor, elevations of the three principal façades, sections, one longitudinal, one cross through the building, showing internal courts, &c. No perspective drawings are to be submitted in either stage of the competition.

Note.—(Clause 17).—The successful architects can amend or redraw their designs for the final stage of the competition if they so desire.

Additional Drawings for the Final Stage of the Competition.

Sections through council chamber and main staircase: scale 8 feet to 1 inch. Detail of a portion of one of the façades; scale 2 feet to 1 inch. All the plans, with the exception of the block plan, to be drawn on paper 52 inches by 30 inches and mounted on strainers with a 2-inch margin. All the drawings sent in to be in dark brown or black ink, in line only and in geometrical projection, but the plans and sections should have the sectional parts filled in solid. In elevations no washes, shading or hatched shadows for the purposes of embellishment will be permitted other than flat washes in the openings. Strict compliance with these restrictions will be enforced.

SCHEDULE D.

Extract from an agreement between the Ecclesiastical Commissioners for England and the London County Council, dated October 17, 1906:—

"The said assurance shall be executed in duplicate and shall contain all such exceptions grants reservations provisions stipulations and conditions as shall be necessary for securing that the Commissioners as regards the land edged blue on the Plan No. 1 hereto annexed but subject to the rights of the existing lessees thereof (short particulars of which are contained in the 4th Schedule hereto) and the Council as regards the land coloured pink on the Plan No. 1 hereto annexed but subject until the Council shall have acquired the same to the rights of existing lessees thereof shall respectively have power at all times without obtaining any consent from or making to each other any compensation to erect as to the Commissioners on the land edged blue and as to the Council on the land coloured pink new buildings the main front walls of which may be carried up to a height of 60 feet from the pavement level next such buildings to the top of the parapet or eaves gutter as the case

may be on the line of the existing frontages (which are shown upon the Plan No. 2) of the said several properties in Belvedere Road shown on the said Plan No. 1 whether such buildings shall or shall not affect or diminish the light or air which may now or at any time or times hereafter be enjoyed by the Council or the Commissioners respectively in respect of the said hereditaments and that the Commissioners and the Council shall have power to deal with the architectural features and the roofs of their respective buildings next Belvedere Road in accordance with the provision contained in the London Building Act 1894 as if that Act applied to the said buildings of the Council. The said assurance shall also contain such exceptions grants reservations provisions stipulations and agreements as shall be necessary for securing that the Commissioners and the Council shall respectively have power in manner aforesaid and without obtaining any consent as aforesaid or making any compensation as aforesaid to increase the height to the top of the said parapet or eaves gutter of the buildings next Belvedere Road on their respective estates edged blue and coloured pink on the said Plan No. 1 to a greater height than 60 feet as aforesaid provided that for every 3 feet increase in height or portion of 3 feet increase beyond the height of 60 feet aforesaid the main front walls of the buildings to be erected on their said respective estates shall be set back 2 feet behind the existing lines of frontage in Belvedere Road aforesaid in respect of the premises of which the height shall be increased beyond the height of 60 feet as aforesaid whether such increased height shall or shall not affect or diminish the light or air which may now or at any time or times hereafter be enjoyed by the Council or the Commissioners respectively in respect of the said hereditaments and the Commissioners and the Council shall have power to deal with the architectural features and the roofs of the said respective buildings in manner aforesaid."

NOTE.—The portion of the site enclosed within the green verge is that which will be reclaimed from the river. The part of the site of which the Ecclesiastical Commissioners were the freeholders is indicated by red stripes. The property referred to in the above extract from the agreement as being edged blue on Plan No. 1 is that lying between the points A and B and edged brown on the block plan which accompanies these conditions. The property referred to as coloured pink on Plan No. 1 is that which was the freehold of the Ecclesiastical Commissioners, and as stated above as shown by red stripes on the block plan which accompanies these conditions. The extent of the Ecclesiastical Commissioners' estate on the east side of Belvedere Road, so far as it affects the Council's site, is indicated on the block plan which accompanies the conditions by a brown verge.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. Walter Cave, vice-president, in the chair.

The following gentlemen were elected members:—Messrs. W. H. Adams, F. R. Hiorns, John Usse, H. A. Welch, G. H. Ledger, C. S. Mordaunt, J. H. P. Fulford, B. P. Collin, S. P. Bush and Sir Chas. A. Nicholson, Bart.

On the motion of the CHAIRMAN votes of thanks were passed to Mr. S. B. Bolas for his donation of a large collection of photographs of Westminster Abbey, and to Mr. Batsford for his presentation of a bust of Inigo Jones.

Mr. W. H. SETH-SMITH read the following paper, illustrated by sketches and lantern slides, entitled—

The Architecture of Sicily.

Italy as the grave of Classic and the birthplace of Christian architecture will probably be the first and most attractive influence to the architectural student, and having paid his homage to the departed Romans and Greeks, mastered the records of the infancy and adolescence of Byzantine and Romanesque from Constantine's conversion in the fourth century, and tried to unravel the tangle of styles and influences up to the Renaissance, he will be in a position to proceed systematically and thus intelligently to study the growth of Gothic art, its external formative influences, and its decline under the all-pervading force of the revival of the Classic spirit. Nor can our travelling student intelligently enjoy this, the most delightful of his experiences, unless he has a sufficient grasp of general European history from the earliest Greek to the end of the eighteenth century.

The loveliness of Sicilian scenery and climate is too well known to need description. Most travellers visit it for these reasons. These qualities will surely be no less enjoyed by the architect whose trained eye for colour and form, and whose field of interest is made so much wider by the pursuit of his specialty—Sicily is beautiful indeed. The rugged barrenness of the mountainous interior is in striking contrast to the undulating luxury of the sea coast, along which, on the north and east of the island, the railways wind amid dense and continuous groves of lemon, orange and almond trees, harmonising with the bluish-green sea. There are no fairer spots in the world than Taormina and Palermo.

Sicily may not be the best destination of a young student of architecture, on account of the very intricate problems its post-Classic architecture presents. To the older architect, however, all this only intensifies the interest, and sets him to work till his mind is as tolerably clear as to the origin as his sense of beauty is awake to the charm of its wondrous buildings of the twelfth century. May I add a warning to the student as to accepting even the best guide-books as authorities on the origin, history, or description of architectural works? In this instance let him read beforehand, and again on the spot, such works as C. A. Cummings's "History of Architecture in Italy," Fergusson's "History of Architecture," Baldwin Brown's "From Schola to Cathedral," Leader Scott's "Cathedral Builders," and consult in the Institute Library such works as Gravina's "Il Duomo di Monreale," Dehli, Gally-Knight, Hittorff, Mothes, Sabazaro, Dautier, &c. I am, however, specially indebted to Cummings. I have not hesitated to quote freely from him, where I could not pretend to his historical research, nor improve on his terseness of general description. Mr. Banister F. Fletcher and others have also kindly allowed me to reproduce some of the plates from their well-known works, and Messrs. Millard, Gerald C. Horsley and J. J. Joass have lent their colour sketches. My object to-night is to give you, if possible, some views and particulars (without, alas! the wealth of colour) which, when you visit Palermo, may make it somewhat easier for you to pursue your studies.

The Early History of the Island.

Situated in the direct and only sea route from the east to west and northern Europe, Sicily was naturally among the earliest lands to be colonised. Moreover, its great beauty, its fertility and good climate and strategic position made it the envy of all nations from the earliest Grecian era to modern times. It is not difficult, therefore, to explain why it has been termed "The Battlefield of the Nations." Phœnicians, Etruscans, Greeks, Romans, Byzantines, Saracens, Normans and Spaniards in succession have struggled in long and deadly conflict for supremacy over the fair and unhappy island, only, in most cases, to enjoy a brief or partial occupation. If we expect to find many monumental evidences of these successive occupations we shall be disappointed, for, with the exception of those of the Greek, Roman and Norman periods, scarcely any traces remain.

The Classic Greek period of 500 years extended from 735 B.C. to 210 B.C., when the Romans finally conquered the island. Notwithstanding the obliteration of the vast city of Syracuse (excepting the theatre), we have important remains still standing of two fine temples at Girgenti and one at Segesta, all, however, bereft of their setting as the central or foreground objects in great and beautiful cities, and of the fine white plaster coating adorned no doubt with colour. In their now dilapidated and fragmentary character and with their coarse yellow sandstone facing it requires a good deal of imagination to restore their primitive magnificence. To my mind, the vast desolation of the recumbent ruins of Selinunte is still more eloquent of the chequered history of these early Grecian colonies. Of the scale of some among these temples an idea can be formed when I remind you that the cast of an abacus of a capital in the Palermo Museum is 12 feet 6 inches square, and that the caryatid of Jupiter in his temple at Girgenti measures more than 24 feet in height. Fewer still are the evidences of the Roman dominion, which lasted 600 years, namely, from 210 B.C. to about 400 A.D. The Romans plundered Sicily of all its treasures of Greek art. The great theatre at Taormina is, however, mostly Roman. From Roman times until 535 A.D. the northern tribes held sway, when it was made subject to the Byzantine emperors, who retained it till they, in their turn, were conquered by the Arabs.

The Saracens.

In 827 Euphemius, the Byzantine governor of Sicily, revolting against the emperor, called to his aid in an evil hour a force of Mussulmans, whose predatory fleets had long infested the Mediterranean. Seizing their opportunity, they conquered Palermo four years later and promptly established themselves as masters of the whole western half of the island, and before the end of the ninth century all Sicily lay under Mohammedan domination. The Arabs had thus an admirable base of operations for attacks on Italy, but notwithstanding their rule of more than 200 years, almost the only genuine Arab monuments remaining are, I believe, the baths of Cefalà and the gate of the town of Ortigia (Syracuse).

The Normans in South Italy.

In 1016 forty Norman knights returning from Palestine stopped at Salerno in South Italy, then in the hands of the Lombard rulers, and found the town hotly attacked by Saracens. Encouraged by their aid the Lombards took heart and the Saracens were driven to their boats. The Normans, ambitious of conquest in this fair land, made several expeditions, which resulted in 1040 in their establishment at Melfi, and in 1053 the Normans were confirmed in their possession of most of South Italy under Robert Guiscard, one of the many sons of Tancred de Hauteville, of Normandy, and received the Pope's pardon. These rude warriors, who had not blushed in the beginning of their career to follow the trade of highwaymen, and were absolutely illiterate, here became the enlightened promoters of knowledge and progress, encouraging with enthusiasm at their court and throughout their territories letters, arts and science, without regard to differences of race or religion.

Sicilian Architecture.

We have very briefly outlined the history of the island of Sicily from its first colonisation by the Greeks of classic times to the fall of the western Roman dominion, and the consolidation in 476 of east and west in the Byzantine Empire. From that time for about 400 years a close connection existed between this island and the eastern part of the empire. Count Roger, the brother of Robert Guiscard, finally completed the work of conquering the Saracens and inaugurated, in 1090, the most brilliant period in the history of Sicily. The population he found there was, as in South Italy, composed of Greeks, Lombards, Italians, Arabs and Jews, who had enjoyed under Saracen rule an extraordinary measure of liberty, each race retaining its own language and to a great extent its civil and religious customs. The official languages were Greek and Arabic. This tolerance was imitated by the Norman conqueror. The Greeks were still allowed to adhere to the code of Justinian, the Lombards to that of Rothari, the Saracens still took their official oaths on the Koran, and the Normans brought in the Frankish laws and customs. Roger set himself to work to pacify and develop Sicily as his brother had done in South Italy. He created the beginning of a civilisation which had no equal in Europe. He had as a foundation the Arab fineness and intelligence consolidated by 200 years of continuous enlightened administration. "Christians and Northmen adopted the habits and imbibed the culture of their Mussulman subjects. Nor did these Scandinavian sultans of Palermo cease to play an active part in the affairs, both civil and ecclesiastical, of Europe. As hereditary legatees of the Holy See they dispensed benefices and assumed the mitre and dalmatic, together with the sceptre and the crown. The commander of Roger's navy was styled Emir or Ammiraglio. The workers in his silk factories were slaves from Thebes and Corinth. His charters ran in Arabic as well as Greek and Latin. His jewellers engraved the gems of the Orient with Christian mottoes in Semitic characters. His architects were Mussulmans who adapted their native style to the requirements of Christian ritual, and inscribed the walls of cathedrals with Catholic legends in Cuphic language. The predominant characteristic of Palermo is Orientalism. The Saracens had their own quarters in the towns and their mosques and schools. Count Roger found a machinery of taxation in full working order—a whole bureaucracy, in fact, ready to his use. In applying this machinery he became the richest potentate in Europe. In this court life men of letters played a first part three centuries before Petrarch taught the princes of Italy to respect the pen of a poet" (John Addington Symonds).

It is estimated that the Normans never formed more than 1 per cent. of the population, and these almost wholly

a feudal aristocracy. Palermo had then a population of about three hundred thousand. Count Roger died in 1101, and was succeeded by his son Roger, the first king, who continued for fifty years the noble work of his father. During his reign peace prevailed and the arts were encouraged. This tolerance, of the Saracens especially, is all the more remarkable when one recalls the fact that the Crusaders, with all the animus they implied towards Mohammedans, were contemporary, but it also suggests the long and close contact of east with west which may explain in some degree the phenomena we are about to examine. Another point to bear in mind is that the second great period of Byzantine art was co-existent with the creation of these Sicilian monuments, that the mosaic decorations of such churches as S. Mark's, at Venice, were not yet completed, and those of the Church of the Saviour, Constantinople, and others at Jerusalem and Bethlehem, and S. Front, at Périgueux, were in progress.

The Early Churches.

The first Norman church, S. Giovanni dei Lebbrosi, was built outside the walls as early as 1071 by Robert Guiscard during his long siege of Palermo. It is a basilican plan with arcades of round arches over octagon piers, fully developed transept, not projecting beyond the aisle walls, but rising as high as the nave. The central bay is covered by a dome. The adhesion to the Roman basilican plan is explained by the fact that the Normans were, on the whole, loyal throughout to Papal authority and to the traditions of the Western Church. When Roger, the first king, was firmly established and was crowned in 1030, churches began to rise all over the island. Those of most interest as illustrating this brilliant episode of European history are all in or near the capital city of Palermo. They group themselves into two divisions, according as their founders followed the traditions of the continental architecture to which they were accustomed, or were governed by those of the native races forming the population. Several of the earlier churches are modified transcripts of smaller monuments of the eastern towns—a Greek cross in a square with central dome, sometimes repeated in the adjacent bays, and with three apses on the eastern side.

The little church of La Martorana, commenced about 1129, well illustrates this type. From the roughly measured plan I made on the spot its original form is seen. Its author was George of Antioch, High Admiral of King Roger. The interior is a Greek cross divided into nine bays, the centre one covered by a high dome on an octagon drum with pointed windows, the transition from the square to the octagon being made by arched squinches. The four oblong bays are covered by pointed barrel vaults, the four square angle bays are lowered and covered by groined vaulting.

Comparing this and other Palermo plans with some of the early Christian churches of Syria and Greece, we can hardly doubt the source of their inspiration. Here, again, are the three eastern apses; in the angles of the openings are set small columns of porphyry and Verde antique. The walls and vaults are covered with mosaics, many of them contemporary. One, probably the oldest in Sicily, shows the founder prostrate before the Virgin, who exhibits to Christ a scroll bearing these words, "Oh, Son of God, protect ever from all harm George, the first of princes, who has raised this temple to me from the foundations." The prevailing tints of the mosaics are blue-greys, greens, madders and white. The aisle vaults are of a rich indigo blue starred with gold, a fine combination giving profundity and strength to the colour composition. The pavement is of beautiful mosaic. The tower is probably older, and is detached by about 50 feet from the original church. It is in four stages, the lower two square and plain, the upper with round angle turrets, which may have suggested those of the cathedral towers, and it was originally crowned with a hemispherical dome. The ornament, such as the billet moulding, is clearly due to Saracenic influence.

Close by is S. Cataldo, about contemporary. It is also a Greek cross in plan, the side bays being narrower, and the three bays of the nave are all covered by domes. The drums are pierced by eight simple pointed windows, and four small windows are set at the base of the dome itself. The domes, as in all the eastern examples, and like all their fellows in Sicily, are simple hemispheres, without ribs or lantern. The side bays are all covered by groined vaults. Four serpentine columns with free Corinthian caps and varied bases divide the interior bays. The aisle apses are

formed in the thickness of the wall. Two steps lead up to the tribune.

S. Giovanni degli Eremiti, finished, like La Martorana, in 1132, but now in a ruinous condition, has a different plan altogether. It is T-shaped and without aisles. The nave consists of two square bays opening into a square tribune. The transept arms, as well as tribune and the two nave bays, are covered by domes. The dividing arches are partly round and partly pointed. The exterior is thoroughly Oriental, although not Saracenic. The domes are formed over squinch arches exactly like those of S. Cataldo. The tower is of same date as the church, and is domed to correspond with the church itself. One is told by the custodian and by most of the guide-books that this church was originally an Arab mosque converted to Christian uses, but the plan is thoroughly Byzantine. Some of the windows are closed by bare plates of marble perforated with an Arabic pattern. The cloisters are very beautiful—arcades of pointed arches on coupled twisted columns.

Another and most remarkable example of Byzantine arrangement and construction is the little chapel at Malvagna, near Randazzo. It is only 18 feet square, and from three sides has open semicircular apses covered as usual by semi-domes, which abut against and buttress the central dome, repeating upon a small scale that of S. Sophia, at Constantinople.

In all these instances the Normans allowed their monument to be built in the style and with the decorations familiar to the peoples they governed. The pointed arch here first introduced to them became general, but it was the arch of the Saracens, broad, high-stilted and without mouldings, and had no relation whatever to the use of the pointed arch of the north of Europe, which was even then beginning to be introduced in the monastic architecture of Italy. Nowhere in Sicily is there any instance dating from this period of an interior which has any hint of a Gothic system. The use of the intersecting vault is confined entirely to the small bays of the aisles or porches, while the naves, where not domed or covered by the equally Oriental stalactite ceiling, are invariably covered with an open timber roof.

The Cappella Palatina.

At the same time King Roger was building, in the royal palace of Count Roger, his predecessor, a chapel whose general plan was more in harmony with the tradition of Italy, and which furnished the type of most of the later churches of the Normans. The Cappella Palatina is, as we see it to-day, substantially the chapel King Roger consecrated in 1140, and is one of the most interesting and valuable monuments of the splendid architecture of the Norman kings. The chapel is entered from the arcaded gallery surrounding the court on the second storey of the palace. Its plan is divided into nave and aisles, with transept as high as the nave, but with no projection beyond the walls, and three apses as in all the earlier churches, the crossing covered with a Byzantine dome like many of the Romanesque churches in both the north and south of Italy. It is only in the treatment of its details, in the use of the pointed arch, and in its sumptuous decoration that we feel the influence of the mixed Orientalism which coloured all the art of Sicily at this period. The nave arcades are of highly-stilted arches with columns alternately of polished granite and marble, with Corinthian capitals. The height of the arch is nearly as great as that of the column, and the stilt nearly half its height. The four columns which support the dome are of unequal diameter, and form, not a square, but a rectangle, longest by about 4 feet in the direction of the nave; the base of the dome at two points thus falls some 2 feet inside its supporting arches, the wall being corbelled forward to carry it. The shadow thus produced as seen from the nave and softened by the rounded surface of the corbel is very effective. The dome resembles many of the smaller churches, and has a ring of small windows at its base. The transept aisles have barrel vaults, and the nave aisles are covered with wood ceilings following the line of the nave roof. The nave has a carved wood ceiling of the richest Moorish character, similar to those in Granada and Seville, and decorated lavishly with gold and colour. The interior surfaces elsewhere are flat, the arches without mouldings and the clerestory and apses without belt or cornice. But these flat surfaces are decorated throughout with the utmost splendour.

Even without their gorgeous colour and lighting of these churches would be fine. The windows of the clerestory and aisles, of nave and transepts, are so small as scarcely

to be seen in perspective, and to give depth and mystery to the ceilings and interspaces; these masses of deep dark and half-tone being repeated beneath the ambone and organ gallery and in the semi-domes of the apses, while a flood of diffused light descends from the dome windows forming a splendid contrast and throwing into high light the clergy in their sumptuous robes and the brilliant accompaniment assembled below, their forms and colours being reflected, as it were, in the series of mosaic figures of saints and angels depicted in the mosaics above. In no other interior which I have seen is this contrast of light and shade so fine, reminding one of the Spanish cathedrals, but the prevailing gloom of a nave so decorated would not have been justifiable in the Middle Ages, except in a private chapel.

The great principle of "breadth" is carried to perfection. I need not say that the glazing of the windows is quite without colour—another most important principle. Any stained glass would have confused the scheme of wall colouring. Everywhere the effort to obtain diffused rather than direct sunlight for the decorations is apparent. There are practically only two divisions of the composition, the upper and the lower portions of the church, the upper being entirely covered, walls, arches, domes, vaults and even soffits of arches, with a wealth of colour, the lower kept quite quiet yet sufficiently broken by line or colour (without pattern) to harmonise with the other portions. For instance, the mosaic pavement, inlaid with circles of serpentine and porphyry, surrounded by winding bands of Alexandrine work, is comparatively cool and subdued, and of geometric design; so is the frieze which separates the great vertical slabs of Cipollino marble, 14 feet high, from the pictorial mosaic above; these slabs being formed into panels by bands of geometric mosaic resembling those in the Alhambra and in S. Sophia, while the marble columns are enriched with fluting to harmonise with their richer toned granite neighbours and other surroundings.

Nowhere are they (the mosaics) permitted to be within 14 feet of the observer. The colour spaces are not broken up by architectural features such as mouldings, but divided by bands or lines of the same material. Every angle or projection is rounded off and the mosaic carried round it, obviating sharp lines of light, and giving beautiful gradation between the different surfaces. Even the wall surfaces themselves are not flat; whether this is due to the method of fixing or was intentionally arranged in preparation of the surfaces for the tesserae, perhaps expert mosaicists present can tell us. We only know the result is excellent. These wall-pictures are of the greatest variety and beauty; the ground is all gold and the figures have much expressiveness and dignity without the rigid formality of most of the Byzantine mosaics. Some are doubtless contemporary with the structure, but the greater part were added during the reign of William I., the son of King Roger, before the end of the twelfth century, and all have been more or less restored, as have also those of the Martorana and of Monreale, the madders in the draperies harmonising beautifully with the porphyry columns and discs. The inscriptions are in black and are both in Greek and Latin, and silver tesserae are used in parts. The silver band of the cupola bears the date of 1143. The organ gallery is a most beautiful composition in porphyry and serpentine, white and red marbles, with gold glass, its design closely following the examples we find in Ravello and Salerno cathedrals. Cummings also speaks of a paschal candlestick of great beauty standing beside the former pulpit. If more beautiful than that we have here it must be beautiful indeed. The pavement in Opus Alexandrinum is of great beauty, consisting of circular slabs of porphyry with bands of colour. In this lovely chapel Norman architecture in Sicily came to its full flowering. In later monuments we find equal magnificence, but nowhere more typical or more beautiful expression of the geniuses of the place and time.

(To be concluded.)

Mr. E. R. Catterns, secretary of the Glasgow School of Art, has received the following letter from the Scotch Education Department:—"Adverting to the letter from this department of the 22nd ult., and to your letter of the 11th inst., I am to state, for the information of your governors, that the department will be prepared to contribute an equivalent of the sum which is raised locally up to a maximum sum of 15,000*l.* But I am to add that the department cannot undertake to make a grant from the funds at present at their disposal in respect of contributions not intimated to them by January 31, 1907."

STEYNING CHURCH.

IN the course of repairing the plaster on the interior walls of the north aisle of the church the stonework of the upper portion of the north doorway was uncovered; it was found in an excellent state of preservation with the staple and hinge of the door itself, which had been built in. This doorway is of the Early English style of architecture, following the Norman, and although in these matters no arbitrary date can be fixed, it was probably erected about A.D. 1300.

The vicar and churchwardens decided not to fill in the recess, and they may, perhaps, go a step further and open out altogether this doorway, thereby adding another entrance to the church, increasing its architectural interest and in part restoring it to its original condition. From the evidence of the brickwork the door had been blocked up in comparatively modern times, possibly in 1832, when the galleries were erected. Few, perhaps, of the parishioners of Steyning attempt to realise the noble proportions of their church in its original condition. The nave extended to the west one or more arches further than it does now, the tower not then being in its present position, and upon the site of the chancel rose the tower with transepts and chapels, the church being a cruciform one.

Steyning Church belonged to the abbey of Fécamp, in Normandy, and is supposed to have been built about A.D. 1150, and the door now referred to was no doubt for the use of the Benedictine monks in passing from the monastic buildings, which stood to the north, into the church itself. Upon the breaking out of the French war in 1415 the possessions of the alien monasteries were taken from them by Henry V., and those in Steyning were granted to the newly founded English abbey of Sion, in whose hands they remained until some time shortly previous to the year 1519, as is shown by extracts from early wills. Upon the withdrawal of the support of the wealthy abbey of Fécamp the monastic buildings and church may have been neglected and allowed gradually to fall into that decay and ruin which doubtless was completed upon the suppression of the monasteries in the reign of Henry VIII.

The influential family of Farnfold resided at Gatwick for many generations, and extracts from their early wills and from those of Pellatt of Charlton Court prove the existence of this north doorway early in the sixteenth century.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the last meeting of the Edinburgh Architectural Association a paper was read by Mr. James L. Lawrence, member of the Sanitary Institute, on "The Sanitary Considerations of Building." After treating of the importance of sanitary science, made-up sites, ground air, dry-rot, &c., he proceeded to deal with the purely public health side, and asked—What, for instance, was the effect of huge blocks of buildings on the health of their inmates? Some authorities say that ordinary infectious diseases are not spread through people living closely together in flats, though one might almost think otherwise. One most insanitary piece of construction brought about by this style of building was, however, the inner court or smaller well. The only good point about it, and even this is doubtful, was that you could open your window at any time of the year without fear of a draught. But instead of pure air they might get a smell of their neighbour's dinner or a concentrated knowledge of the ash bucket in the court below. This, with practically no sunlight and too often the need of artificial light from November till March, should make them hope that planning of this nature would not be long perpetuated. He (the lecturer) noticed some time ago that a reason put forth for the cause of the domestic servant problem in London and elsewhere was the bad quarters to which servants were relegated, often with an outlook into these wells. Nor did he think they were much better off elsewhere, when an old, badly-lit room without a fire was found to appear on a plan, and which was found convenient to designate "box-room." How often was such a room made to serve the purpose of housing the unlucky servant? He did not think ordinary people nowadays were blessed with quite so many boxes as an architect would sometimes make out from the space he allots to them, and, too, he thought the Dean of Guild Court sometimes expressed a similar opinion. Of course, if a fire could not be arranged for, it might also be difficult to put in what the law demanded—a flue, or one that really did its work; but, if possible, this

should be provided, because, after all, how many people do have fires in their bedrooms except in cases of illness? A point sometimes apt to be forgotten in modern kitchens was the necessity of leaving a flue for gas stoves. No matter the size of the house, tenement or otherwise, they may safely infer that if gas was to be obtained a gas stove would be used, and provision should always be made for it. The kitchen was to a great extent a dwelling-room, and special provision in ventilation should be introduced for the comfort of its inmates. No doubt the badly-cooked dinners one perhaps reads about more than experiences were partly occasioned through indisposition of the cook caused by bad kitchen ventilation.

On the motion of Mr. Thomas Fairbairn, a vote of thanks was conveyed to Mr. Lawrence. The Association has resolved to open an exhibition of architectural interest to be held next summer during the months of June, July and August. An exhibition of this nature has not been held in Edinburgh for a quarter of a century, and as the Edinburgh Architects' Association celebrates the jubilee of its existence in 1907 the year is considered a specially suitable one for the venture. The exhibition will be held in the Galleries of the Royal Scottish Academy.

IRISH ARCHITECTS' PROTEST.

THE following letter has been forwarded to the members of the Royal Hibernian Academy by the Council of the Royal Institute of the Architects of Ireland:—

Mr. President and gentlemen,—We, the President and Council of the Royal Institute of the Architects of Ireland, desire to add an unanimous voice to the protest which you will, doubtless, make against the majority report of the Commission on the Royal Hibernian Academy and the Metropolitan School of Art lately issued.

We deprecate most strongly the proposal to reduce the Royal Hibernian Academy to the level of a society of merely exhibiting artists, thereby depriving it of all claim to its academic functions.

We would wish also to express our appreciation of the admirable minority report presented by Mr. Justice Madden and Mr. J. P. Boland, M.P., a report which indicates how thoroughly these gentlemen recognise the fundamental difference between the functions of an academy of arts and an art school.

We conclude in expressing our earnest hope that the voice of the artists of Ireland may not be stifled by recommendations based solely on the evidence and suggestion of Department officials, and that no action by the Government, conceived on the lines of the majority report, may result in what would undoubtedly be the extinction of our Academy.

We are, Mr. President and gentlemen, your obedient servants,

Signed on behalf of the Council of the Royal Institute
of the Architects of Ireland,

W. M. MITCHELL, President.

J. H. WEBB, Hon. Sec.

20 Lincoln Place, Dublin:
December 14, 1906.

AMALGAMATION OF GALLERIES.

IN a letter to the *Glasgow Herald* Mr. John Honeyman, R.S.A., offers the following suggestions:—

In view of differences of opinion which have arisen regarding the constitution of the Board which is to be entrusted with the care of the National Gallery, I venture to suggest an arrangement which I think would be found workable and advantageous, although likely at first sight to stir up patriotic prejudices. It is that the National Gallery and the Scottish and Irish Galleries—nominally, but not really, national—should be amalgamated, so that we should have only one National Gallery, part of the national collection finding a home at Edinburgh and part at Dublin.

By some this might be regarded as an encroachment on "Scottish rights," but I am disposed to take a broader view of the subject. Every Scotsman will continue to admire and venerate Edinburgh and give her pre-eminence over other cities as the capital of the ancient kingdom; but she is not the capital of the United Kingdom, and in a United Kingdom there can be only one king and one capital, and—strictly speaking—only one National Gallery. It would be a great mistake—indeed, altogether wrong—were we to

despite the privileges we may claim or disregard the duties and responsibilities which devolve upon us as subjects of the wider realm.

The suggested arrangement would have two important economic results. It would lessen the chance of competition for works of art, and it would save any need for the extension of the present building on the Mound if the Royal Scottish Academy is removed from it, if a wise system of interchange among the three sections of the national collection is adopted. For it would obviously be better to have the present building full of pictures of the highest merit than to have a gallery twice the size filled with inferior work.

If the Edinburgh Town Council thinks otherwise, and prefers quantity to quality, it has only to carry out its scheme for completing its national monument and converting it into a municipal art gallery, but in that case the people of Edinburgh would require to raise the necessary funds, like their neighbours in the West.

DISTRICT SURVEYORS' DISTRICTS.

THE Building Act committee of the London County Council report that they have under consideration the question of adjusting the limits of several more district surveyors' districts in order to make them, so far as may be possible and convenient, coterminous with the boundaries of the electoral areas constituted under or in pursuance of the London Government Act 1899. The present time is particularly favourable for such alterations, as, owing to deaths and resignations, a considerable number of districts are vacant. Section 139 (i) of the London Building Act 1894 provides that the Council may, subject to the payment of compensation to any district surveyor who is thereby deprived of his office, alter the limits of the district of any district surveyor or unite any two or more such districts, and place any such altered district under the supervision of any district surveyor. Broadly speaking, the effect of the recommendations, if adopted by the Council, will be the reduction of the three Islington districts to two, viz. Islington (South) and Shoreditch, and Islington (North) and St. Pancras (North); the reduction of the four districts into which the City of London is divided to three, viz. City of London, East, South and West; the union of the two districts of Fulham, north and south; the division of the existing district of Lewisham into two districts and the modification in other respects of the boundaries of nine districts. In the event of the recommendations being adopted, it is proposed to invite applications for the appointments of district surveyors for the several vacant districts by advertisement and to submit recommendations with regard thereto as soon as possible. The committee have negotiated with the district surveyors concerned and recommend—

(a) That the Islington portion of the district known as Clerkenwell and part of Islington be severed from that district, and be added to the adjoining district of Islington (South), Shoreditch and Norton Folgate.

(b) That the portion of the vacant district of Islington (South-west), St. Luke, Old Street and the parish of Glasshouse Yard, within the metropolitan Borough of Islington, southward of the railway through Highbury station and Maiden Lane station, be added to the adjoining district of Islington (South), Shoreditch and Norton Folgate.

(c) That Norton Folgate be severed from the district known as Islington (South), Shoreditch and Norton Folgate, and added to the adjoining district of Whitechapel, Spitalfields, Mile End New Town and Tower Liberty.

(d) That the district of Islington (South), Shoreditch and Norton Folgate, readjusted as outlined in the foregoing resolutions (a), (b) and (c), be designated Islington (South) and Shoreditch.

(e) That the portion of the vacant district of Islington (South-west), St. Luke, Old Street and the parish of Glasshouse Yard, within the metropolitan Borough of Islington, northward of the railway through Highbury station and Maiden Lane station, be added to the adjoining district of Islington (North) and St. Pancras (East).

(f) That the portion of the district of St. Pancras (West), northward of the railway through Camden Town station and Chalk Farm station, be severed from that district and added to the adjoining district of Islington (North) and St. Pancras (East).

(g) That the portion of the district known as Islington (North) and St. Pancras (East), southward of the railway through Maiden Lane station and Camden Town station, be

severed from that district and added to the adjoining district of St. Pancras (West).

(h) That the district of Islington (North) and St. Pancras (East), readjusted as outlined in the foregoing resolutions (e), (f) and (g), be designated Islington (North) and St. Pancras (North).

(i) That the portion of the district known as Holborn, East Strand and part of St. Pancras, within the metropolitan Borough of St. Pancras, be severed from that district and added to the adjoining district of St. Pancras (West).

(j) That the district of St. Pancras (West), readjusted as outlined in the foregoing resolutions (f), (g) and (i), be designated St. Pancras (South).

(k) That the portion of the district known as Holborn, East Strand and part of St. Pancras, within the metropolitan Borough of Finsbury, be severed from that district and added to the adjoining district of Clerkenwell and part of Islington.

(l) That the portion of the vacant district known as Islington (South-west), St. Luke, Old Street, and the parish of Glasshouse Yard, within the metropolitan Borough of Finsbury, be added to the adjoining district of Clerkenwell and part of Islington.

(m) That the district known as Clerkenwell and part of Islington, readjusted as outlined in the foregoing resolutions (a), (k) and (l), be designated Finsbury.

(n) That the portion of the district known as Holborn, East Strand and part of St. Pancras within the city of Westminster, be severed from that district and added to the adjoining vacant district of Bloomsbury, St. Martin-in-the-Fields, Soho and Covent Garden.

(o) That the portion of the vacant district known as Bloomsbury, St. Martin-in-the-Fields, Soho and Covent Garden, within the metropolitan Borough of Holborn, be severed from that district and added to the adjoining district of Holborn, East Strand and part of St. Pancras.

(p) That the district of Holborn, East Strand and part of St. Pancras, readjusted as outlined in the foregoing resolutions (i), (k), (n) and (o), be designated Holborn.

(q) That the vacant district of Bloomsbury, St. Martin-in-the-Fields, Soho and Covent Garden, readjusted as outlined in the foregoing resolutions (n) and (o), be designated Strand.

(r) That the Queen's Park ward of the metropolitan Borough of Paddington be added to the district of Paddington, and that the late detached portion of St. George, Hanover Square, on the north side of Bayswater Road, be severed from the district of St. George, Hanover Square (North) and added to the district of Paddington.

(s) That the detached portion of the vacant district known as City of London, Western Division (viz. Cheap Ward), be added to the vacant district known as City of London, Eastern Division.

(t) That so much of the vacant district known as City of London, Northern Division, as is situate westward of a line running north and south along the centres of Moor Lane, Fore Street, Aldermanbury Postern, Aldermanbury and Milk Street be added to the vacant district of City of London, Western Division.

(u) That so much of the vacant district known as City of London, Northern Division, as is situate eastward of a line running north and south along the centres of Moor Lane, Fore Street, Aldermanbury Postern, Aldermanbury and Milk Street, be added to the vacant district of City of London, Eastern Division.

(v) That the district known as City of London, Western Division, readjusted as outlined in the foregoing resolutions (s) and (t), be designated City of London (West).

(w) That the district known as City of London, Eastern Division, readjusted as outlined in the foregoing resolutions (s) and (u), be designated City of London (East).

(x) That the district of Lewisham be divided by a line along the South-Eastern and Chatham Railway through Lewisham Road and Catford stations, and that the two districts so constituted be designated Lewisham East and Lewisham West.

(y) That the district of Fulham (South), when vacant, be added to the district of Fulham (North), and that the district so constituted be designated Fulham.

(z) That where alterations in the limits of districts are approved by the Council, the solicitor do take such steps as may be necessary to secure the carrying out of such alterations, which shall be subject to the conditions that any works in progress, and any proceedings in progress relating to any dangerous or neglected structure, or any other building or structure in areas surrendered by a district

surveyor shall, notwithstanding the transference of those areas from his supervision, continue to be supervised by him until the completion of such works and proceedings, and that no district surveyor shall claim compensation for any diminution of income which may hereafter arise by reason of such adjustments of limits.

(aa) That unless otherwise specified, and subject to the conditions mentioned in the foregoing resolutions, the alterations of district limits do take effect on and after January 1, 1907, and that the solicitor do take such steps as may be necessary with reference thereto.

Sculpture in Relation to Architecture.

SIR,—Will Mr. S. C. K. Smith allow an addition to his moral? It is this—that in order to become allies the sculptor must understand something at least of architectural form and proportion, and the architect something of human form and proportion. It is marvellous how incompetent architects and architectural draughtsmen are to draw the human figure, clothed or unclothed, or to proportion it to the scale and perspective of even high-class architectural drawings. It is marvellous, first, because one would think that a professional draughtsman would be able almost intuitively to produce something with some more or less correct and artistic approximation to the shape of the human figure, and secondly, because those whose occupation almost daily is drawing to scale spoil masterly productions by introducing figures to the scale of those on tradesmen's illustrated paper bags. Week after week drawings are reproduced in the architectural papers containing caricatures not only of the human form divine, but of animals, trees, benches, carriages and horses, and goodness knows what besides, that would be a disgrace to a sixth-standard schoolboy. One of the subjects in architectural examinations should be figure and landscape drawing, and then perhaps the unnecessary introduction of diminutive figures that have not a joint that is not dislocated, nor a member that is not deformed, and which can only just look over the top of the stall boards of the shops, or might perhaps by standing on tiptoe be able to reach the bell-pull, but certainly not the knocker, would not be so frequent in the drawings that are sent to the architectural papers for reproduction. If the architect cannot introduce decent figure-work into his drawings, how can he expect or be expected to be able to deal with sculpture?

ROBERT A. DAVIS.

Broxwood, Pembridge, Herefordshire :

December 15, 1906.

Fire at Messrs. Whitehead's.

SIR,—Will you kindly allow us the opportunity, through the columns of *The Architect*, to state that the serious fire at our store yard in Dorset Road, which was so prominently noticed in the daily press of the 13th inst., has not in any way affected our workshops, stables and main yard (situated at Portland Place North), and in no way inconveniences us except as regards loss of stock. Our business is therefore being carried on as usual, and the insertion of this statement will remove the impression to the contrary that has become current, and has caused us considerable trouble. Thanking you in anticipation, we remain, yours faithfully,

L. WHITEHEAD & Co., LTD.

JAS. WALLIS, director.

Portland Works, Portland Place North,

Clapham Road, London, S.W. :

December 17, 1906.

GENERAL.

Mr. Sydney F. Hall, M.A., M.V.O., has had the honour of submitting for the King's inspection a sketch of the Chapter of the Order of the Garter and Investiture of the King of Norway held by his Majesty at Windsor Castle.

Mr. Frank Burnett, a Glasgow architect, has offered to give 2,000 square yards of ground near Earlston Avenue, St. Rollox, for a playground, on condition that it be left an open space for all time. The Town Council resolved to accept the gift.

Aston Parish Church is to be restored at a cost of 2,500l. under the direction of Messrs. J. A. Chatwin & Sons. The work will include the erection of a porch at the south door.

Professor F. M. Simpson is to deliver a course of ten lectures at University College on "The Seven Ages of Architecture" before the teachers of the London County Council. He has been appointed architect to advise as to the redistribution and adaptation of the buildings of London University College consequent upon the removal of University College school to Hampstead.

Dr. F. Parkes Weber has presented the Guildhall Library with a valuable collection of historical coins, tokens and pieces of money, numbering in all about 1,200 specimens. The British Museum authorities have also selected over 5,000 specimens. The rest of the collection will be sold for the benefit of the German Hospital.

The Duke of Devonshire has contributed 300l. towards the restoration of Selby Abbey, which was partly destroyed by fire in October. The fund is now fast approaching 30,000l., and the work of restoration will be proceeded with almost immediately under the direction of Mr. J. Oldred Scott.

"The Five Sisters" Window in the north transept of York Minster is to be protected at a cost of 200l. The present green plates and iron stanchions used as a protection will be removed, and replaced by a complete outer skin of clear white glass similar to that lately supplied to the chapter-house windows. The five windows each require 1,750 feet of glass.

The Late Charles Lock Eastlake, architect, who was keeper and secretary of the National Gallery, has left property of the value of 15,082l. 6s. 3d.

The Bridge House Estates Committee on Monday accepted the tender of Sir William Arrol & Co. for 203,000l. for widening of Blackfriars Bridge. The work will commence early in 1907 and will take about two years to complete.

The Death has taken place at Bristol at the age of eighty-four of Mr. Clement Tate, who was for many years in the Government service at Dover, Woolwich and Portland. As surveyor of works at Dover he was instrumental in unearthing the Roman pharos on which the Lords Warden of the Cinque Ports were sworn into office up to about a hundred years ago, when the site was lost.

Sir Rowand Anderson has been appointed architect by the Council of Dundee University College for the new physics laboratory provided by a gift of 12,500l. from Mr. Carnegie. He is also to advise regarding the site to be selected for the new buildings.

Mansfield College, Oxford, has just received two interesting gifts. An anonymous donor has given 3,000l. for the purpose of beautifying the chapel with stained-glass windows; while Miss Clark, a lineal descendant of Gainsborough, has handed the College four works by that artist.

Mr. Banister Fletcher is to deliver a lecture on "Roman Architecture" (introductory in connection with the University Extension Guild) at the University of London, South Kensington, on January 7 next.

A Gift of £300 has been made anonymously by a friend of Mr. T. Graham Jackson, R.A., to be spent during the ensuing year on completing the decorative carving in the Examination Schools, Oxford. Brasenose College has made a grant of 100l. towards the provision of new cases at the Ashmolean Museum.

Mr. J. C. Dollman's *Famine*, which was exhibited at the Royal Academy in 1904, has been presented to the Art Gallery in Peel Park, Salford, by Mr. James Gresham.

A Stained-Glass Window has been placed in the Roman Catholic church at Bishop's Stortford, which is composed of fragments of a window which was in the adjoining church of St. Michael's, in pre-Reformation times, and which was discovered in a summer-house window.

The Rev. James King, vicar of St. Mary's, Berwick-upon-Tweed, has issued a pamphlet on "The Edwardian Wallis and Elizabethan Ramparts of Berwick-upon-Tweed." The profits will be devoted to the poor. The author says his little book is not a history of Berwick, but a brief account of its magnificent walls and masonry, furnished by the internal evidence of the decaying stonework, and supplemented by a little knowledge of architecture, archaeology, and fortification.

The American Institute of Architects have decided to award medals to those who have most signally contributed to the art aspect of architecture. Sir Aston Webb, R.A., is to be the first recipient. The presentation of the medal will take place at Washington on January 7, and Sir Aston and Lady Webb will leave for America on Saturday.

The Architect.

THE WEEK.

THE limited competition for the new buildings at Bangor for the University College of North Wales has been decided in favour of Mr. HENRY T. HARE. Sir ASTON WEBB, R.A., was the assessor, and in his award he says:—"I have now carefully examined the four sets of designs, with the reports of their authors, that have been sent in for the proposed new buildings, and I am of opinion that all of them have sufficiently complied with the conditions of competition to entitle them to the premiums offered. I have also made a careful examination of the site and its surroundings, and I am of opinion that the design that best meets the requirements and the conditions laid down for the competition is that marked No. 2, and I therefore place this design first, and consider that the author is entitled to the premium of 250*l.* Judging from this design, I feel confident the author would provide a satisfactory building, and, subject to his being prepared to meet the Council in making any variations in the plan and arrangements that they may think desirable after consultation with him, and to his being able to justify his estimate, I should strongly recommend the Council to appoint the author of the design marked No. 2 as the architect for the new buildings." The expenditure is calculated at over 200,000*l.* The Council have accepted Mr. HARE's plans, and the KING has been invited to lay the foundation-stone.

WE have already referred to the remarkable will of the late JOHN STUART M'CAIG, who died in 1903. His property was worth from 2,000*l.* to 3,000*l.* a year, and there was some 10,000*l.* in money. The revenue of his estate was, according to the testator, "to be used for the purpose of erecting monuments and statues for myself, brothers and sisters on the tower or circular building called the Stuart M'Caig Tower, situated on Battery Hill, above Oban, the making of these statues to be given to Scotch sculptors from time to time as the necessary funds may accumulate for that purpose; also that artistic towers be built on the hillock at the end of Aird's Park, in the parish of Muckairn, and on other prominent points on the Muckairn estate, and on other prominent places on the various estates; such, in particular, as the Meolreor of Balagown, lying north-east of Kilachonish farmhouse. My wish and desire is to encourage young and rising artists, and for that purpose prizes be given for the best plans of the proposed statues, towers, &c., before building them." In a codicil he added:—"I particularly want the trustees to erect on the top of the wall of the tower I built in Oban statues in large figures of all my five brothers and of myself, namely, DUNCAN, JOHN, DUGALD, DONALD, PETER and of my father MALCOLM, and of my mother MARGRET, and of my sisters JEAN, CATHERINE, MARGRET and ANN, and that these statues be modelled after photographs. And where these may not be available that the statues may have a family likeness to my own photograph or to any other member of my foresaid family, and that these statues will cost not less than one thousand pounds sterling, and that money to come out of the accumulated clear revenue." The authorities of the University of Glasgow were constituted as his trustees. A sister of the testator brought an action to have the will set aside on the grounds that she could not be divested of her rights of succession except by constituting beneficial rights in favour of third parties. In the first Court the action was dismissed and an appeal was brought before the higher Courts. A majority of the judges found in favour of the plaintiff. The Lord Justice Clerk said it could not be suggested that Oban would be benefited by the statues. Nor could it be considered as a charity or education, for

there was to be a competition among young artists for the towers and statues. If the cost of the designs, another of the judges said, represented the whole of the expenditure, it might be concluded that the prizes could be bestowed without the erection of the towers, and the burden could be borne by the estate. The arrangement was proposed to be continuous. But the creation of statues and artistic towers could not go on for ever. The young architects and sculptors of Scotland have accordingly lost a source of income which was without a precedent, and it would not be impossible to use the money in a more serviceable way than the Court of Session imagined.

AN inquiry was held last week in Dublin by Mr. COWAN, the chief engineering inspector of the Local Government Board, respecting an application of the Corporation for authority to borrow 134,000*l.* for the construction of a reservoir. Plans were submitted, but the inspector said he could not discover who was responsible for their accuracy. In 1895 the estimate for the work was only 65,000*l.* After the objection of the inspector, the solicitor to the Corporation asked for an adjournment for six weeks in order to allow of further consideration of the plans. The inspector in agreeing said that, although his examination of the plans could only be superficial, his suggestions had led to a reduction of 12,000*l.* in addition to a correction of prices amounting to 9,000*l.* The proceedings are a commentary on the methods of carrying out public works in the poorest city of the country. It must be allowed, however, that the inhabitants have hitherto been fortunate in obtaining cheap water. A return was read by the inspector from which it appeared that the capital cost of water was in Dublin 2*1*/₂*l.* per head; Belfast, 4*5*/₈*l.*; Birkenhead, 2*1*/₂*l.*; Birmingham, 7*2*/₃*l.*; Bolton, 3*0*/₃*l.*; Bradford, 7*1*/₅*l.*; Cardiff, 5*9*/₈*l.*; Dundee, 4*5*/₈*l.*; Edinburgh, 4*4*/₅*l.*; Glasgow, 3*5*/₈*l.*; Leeds, 4*9*/₈*l.*; Liverpool, 5*1*/₂*l.*; Manchester, 5*5*/₈*l.*; Oldham, 5*2*/₈*l.*; Sheffield, 6*6*/₈*l.* The cost per head to the population per annum for water was:—Dublin, 3*8*/₈*d.*; Vienna, 3*9*/₈*d.*; Glasgow, 4*8*/₈*d.*; Berlin, 4*8*/₈*d.*; Paris, 4*8*/₈*d.*; Manchester, 5*8*/₈*d.*; Liverpool, 5*8*/₈*d.*; Birmingham, 6*8*/₈*d.*; Melbourne, 6*8*/₈*d.*; Chicago, 7*8*/₈*d.*; London, 7*8*/₈*d.*; New York, 8*8*/₈*d.*; Philadelphia, 10*8*/₈*d.*; Boston, 10*8*/₈*d.*

THE International Conference on Labour Regulation which was held in Berne in September was confined to the official representatives of the fourteen States of Europe. It is accepted that restrictions on industrial methods for the benefit of workpeople should be simultaneously employed by countries which are competitors, and also applied in an equal degree. One important measure which was brought forward was not received with the unanimity which had been anticipated. It was a proposal to establish an International Commission on which each of the States would be represented, which would meet whenever there was business to transact, and whose function would be to inquire into disputes that might arise from the interpretation or execution of the Convention and to express an opinion on the matter at issue. Continued disagreements would be referred to arbitration. The Commission would also be charged with the duty of choosing the subjects and preparing the material for future conferences on industrial questions. It was not intended that it should possess any powers of authoritative control. Its function would be that of a board of conciliation offering advice, not that of a judicial tribunal issuing decrees. On this proposition the opinion of the Conference was divided. At the outset only six of the fourteen States declared themselves in its favour. After prolonged discussions the number of States supporting a somewhat modified proposal on the same lines was raised to ten. But the remaining four—Germany, Austria, Hungary and Belgium—were not ready to assent, and it was thought inadvisable to proceed to the establishment of a Commission of this character without concurrence by Google

THE REPORT ON HOUSING OF THE WORKING CLASSES.

THERE has been such an accumulation of volumes, reports and returns on the subject of the dwellings of the working classes in this country, it might be supposed that no further information was needed. We should remember that in a progressive State the standards become higher as time rolls on, and what would satisfy the sanitary commissions half a century ago is now regarded as inadequate. This fact should not be lost sight of. Another and no less satisfactory circumstance is that even among the rural classes there are new ideas of their position. As the last committee say, "A higher standard of living throughout the country has correspondingly increased the demand among the younger generation for a better-kept cottage, with more accommodation and space than the older generation were content with."

A comparison of the select committee's report on the Housing of the Working Classes Act Amendment Bill with one of the earlier documents of the same class would suggest how far ideas have advanced, especially in recent years. The committee say they have gone through the Amendment Bill and have agreed to report it without amendment. That may seem hardly sufficient to explain the necessity of having thirty-six sittings in order to examine witnesses and to consider the different clauses. But when it is recalled that the committee treated the subject of housing both in towns and in the rural districts, a shorter period for examination would appear to be insufficient.

All who have studied the subject are aware that for many years what may be called the sanitary movement has been identified with cities and towns alone. One of the earliest inquiries was undertaken by the Health of Towns Commission, and for a long time the country was ignored. It did not require much observation to discover that the cottage homes of England, which appear to be so attractive in the descriptions of poets and the paintings of artists, were full of defects. The earthen floors were considered by ERASMUS, who was in England in the time of HENRY VIII., as one of the causes of the recurrence of epidemics. Everyone who was not satisfied with admiring the picturesqueness of labourers' cottages could discover similar difficulties without trouble. But somehow the dangers were cloaked over, or it was believed that pure air and healthy occupations were compensations provided by nature, and that the agricultural labourer was always a model of vigorous health. WILLIAM COBBETT was the first to suggest in modern times that there were evils which men of the class to which he belonged found it difficult to overcome, and he explained how the rustic labourer's life was trying and dangerous.

The select committee make no distinction between country and town, and they propose that such a distinction should be overlooked, and that housing should be treated as one important national subject regardless of the position of the dwellings. But about dwellings in towns there has been of recent years so much legislation, the committee wisely bestow most attention upon the problem as it relates to rural districts. What is remarkable is that the emigration from the country to towns is now on a greater scale than in any former time. It has been ascertained that in the post office, police, railways, gasworks, breweries, stores, &c., 46 per cent. out of the total number of men employed were country born. That is not advantageous for many reasons, and the remedy, as the committee say, "would seem to be rather in retaining the existing rural population than in endeavouring to restore to the land those who have already left it for the towns." For that purpose it is necessary to provide suitable dwellings of the cottage class. The committee do not lay the whole blame for the change of population on landowners. They recognise that, in spite of decreasing rentals and the increased cost of building, many of

them have expended large sums in the erection of good cottages from which no direct return is available. They believe that cottage property does not pay. Efforts have been made to prove the possibility of erecting comfortable, though modest, cottages for 120*l*. The committee believe that cottages built in a pair cannot be erected at less than from 150*l*. to 175*l*. each, and that this sum would not include the cost of site nor the provision of a water supply where none exists. But the committee were convinced that, however cheaply they were constructed, rural cottages cannot be produced on an economic basis.

They are no less confident that if land could be added then a more satisfactory result might be anticipated. One witness declined to consider a cottage apart from attached land, for he believed that it was easier to pay fair rent for land and cottage together. Under whatever circumstances the land is obtained, a plot would appear to be essential for every cottage which is to be erected to meet the existing difficulties.

The condition of cottage property can often be traced to the indifference of landowners; some are absentees, and agents in general have an antipathy to laying out money on repairs. In London and in large towns buildings are often allowed to remain vacant from that cause, and in the country, where the occupants are generally poor, the agents are less unbending than with town houses. Cottages are also owned by investors who, although punctual in demanding the rents, are negligent about repairs. Neglect, according to the committee, leads to insanitary dilapidations and to the creation of village slums; the better-class tenants are driven to towns while those who remain are degraded. Care is taken in some places to avoid erecting better dwellings through fear that the bad cottages would become unoccupied. The committee do not hesitate to say that "on many rural district councils members may be found who are interested in property of this character." It is curious that in respect of repairs, as in other economic problems, Switzerland has provided examples for imitation. According to the report:—"A charge of 10 per cent. is put on the cottages and at the end of the year a refund, more or less according to the amount of the repairs required, is made to the tenant. This acts by way of a bonus to the careful tenant. It stops the little defects that would otherwise become more serious, and the rough or careless occupier is trained to good habits. The committee see no reason why some such system should not be adopted, by way of experiment, with houses that may be erected by the local authorities, and would like to see it done in different parts of the country by landlords in a position to give it a trial." Up to 1875 the condition of dwelling-houses was considered to be a matter for owners and occupiers, but when public authorities were allowed to inspect and to order improvements of dwellings, the door was, as it were, opened for further interference with property by Government or local officials. It has been found that out of 667 districts 427 have by-laws relating to new buildings. There is, however, a rural code as well as an urban code, and under the former the committee say "wooden cottages can be built," for questions of stability are not recognised. We doubt whether all rural authorities would agree with the committee, for in some country places efforts have been made to enforce stringent regulations. But in other places there has been so much indifference shown that many witnesses have advocated the transfer of the power of the rural district councils to the Local Government Board, or to some larger or more central body.

The select committee have endeavoured to be as impartial as possible, and they state that councils and their officers hesitate to condemn insanitary property in the country because proper accommodation was not to be obtained. The only alternative was to allow the inmates to live amidst surroundings that were risky or to deprive them of a home. They think, however, that

without demolition many nuisances might be suppressed, and that it is much easier to repair cottages under the existing law than to build new cottages in several places. Many local authorities hesitate about taking advantage of the Act of 1890, because, as the Norfolk County Council have declared, it is perfectly clear that suitable cottages cannot be built at a rent which will guard the rates from liability and loss. The compulsory purchase of land becomes expensive and the district council, as well as the speculative builder, find it an obstacle not easy to be overcome.

The committee are compelled to say "that if any real improvement is to be effected, it can only be by drastic change in the character and administration of the law." Architects and surveyors would agree that such a conclusion was inevitable, but ratepayers in general must look forward to the changes with some alarm. The committee believe there is no use in confiding the carrying out of sanitary laws to small bodies, and especially in all matters relating to building. It is said:—"A rural district council are at a disadvantage in regard to building cottages as against the ordinary builder. The council must, as the sanitary authority, rather set an example to other builders. They have not usually much experience in building nor in the drafting of specifications, neither have they usually a competent staff to supervise such work. Building houses singly or in small numbers adds to the cost of a house in every item. An authority having jurisdiction over a wide area could enter into larger contracts and secure the corresponding saving; it could borrow more cheaply and lay down a more uniform and therefore more economical and efficient procedure."

It is therefore proposed to make each county council the proper authority, although it may be necessary to increase the number of the members. Each council, it is said, should be required to appoint a public health and housing committee, and to add to them men or women who are known to be well-informed on the subject of housing. The chief executive officer should be a medical officer of health, who is not to be allowed to undertake private practice. He should have an adequate staff of sanitary inspectors, whose whole time should be given to their duties. It is considered of the greatest importance that a register should be prepared of every house and tenement in rural districts of a certain specified value, and which should record the number and description of rooms and offices in each house, the occupants, the sanitary condition, the state of repair, water supply, rateable value, &c. In Holland a similar survey is demanded under the new housing law, and no less than twenty-one points of detail are required. In Germany, France and Belgium similar records are made. All our owners of property are to prepare returns relating to the sanitary condition of each house, and they are to be liable to a fine if it should be found to be false. Water supply and drainage are also to be considered; in fact, the committee are of opinion that it is desirable to keep the administration of public health and property under one authority. As part of the system, it is proposed that "the Local Government Board should establish a staff of officers for the special purpose of supervising the construction, sanitary condition and repair of houses under the Public Health Acts, and the provision of houses under the Housing Acts. These inspectors would also be useful in giving practical advice on the preparation of schemes and in co-ordinating the activities of private and municipal enterprise. They should be instructed to make continuous but not necessarily regular visits to the area allotted to them from time to time. It is important that the inspectors should be interchangeable and not tied down to one district."

So much importance is given to land, which may vary from one-quarter acre to three acres, the committee believe that no solution will be satisfactory until the local authority can purchase land compulsorily on the basis of its rateable value. If the young labourer

should have a prospect of rising to be a farmer, some thing must be done to alter the present conditions, which are not auxiliary to his advancement. If the County Council cannot purchase the land at agricultural price needed for cottages, it is proposed to allow them to take the land on lease and to sublet it. The Council may advance to any occupier of a house in an agricultural district four-fifths of its fair purchase value, to be repaid by instalments at low interest. The committee point out the room for reform in the procedure for the transfer of ownership in land, and they have been struck by the relatively enormous amount of solicitors' costs in comparison with the actual value of what is conveyed, which of necessity has a repressive effect on the free interchange of land.

The great difficulty still remains to be considered—that of finance. The Imperial Exchequer will have to give the aid that is necessary. The rate of interest on loans must be lowered. At present the rates vary from $2\frac{1}{2}$ to $4\frac{1}{2}$ per cent., the minimum rates being $2\frac{1}{2}$. The difference between $2\frac{1}{2}$ and $4\frac{1}{2}$ per cent. on a house costing 200*l.* is equivalent to 3*l.* a year in rent or 60*l.* in capital. The committee also find that the Treasury are charging for the capital expended in the erection of workmen's dwellings something between 20 and 40 per cent. more than the workman gets for the money he lends the State through the friendly societies and the Post Office Savings Banks. Those banks have deposits amounting to 150,000,000*l.*, upon which only $2\frac{1}{2}$ per cent. interest is allowed, and it is suggested that the money should be lent to the local authorities for the purpose of building cottages for the working classes. Trustees of charitable funds have over 20,000,000*l.* invested in $2\frac{1}{2}$ per cent. consols and annuities. It is suggested that this sum also should be utilised for housing. The committee are of opinion that the time for redemption should be extended to sixty years.

It will be evident that if the recommendations of the select committee are carried out there will be nothing less than a revolution in rural life. Although it is not believed that cottages can be erected for less than 150*l.*, it is possible that when a vast number have to be erected arrangements could be made which would enable builders either to lower the price or to employ a better class of materials. If a labourer's cottage is to last for eighty years it cannot be of the jerry-built class. The undertaking of housing by the County Council would necessarily give an impetus to building, for ordinary proprietors of estates would enter into competition with the local authorities in order to keep sufficient workmen near them. The committee have precedents in the reports of other committees for some of their most startling proposals, and it may therefore be concluded that sooner or later the recommendations will have to be carried out. At the present time land in many parts of England is practically of no account, and as it cannot be rendered profitable without human agency, it becomes necessary that houses for agricultural labourers should be easily obtained. In other words, the builder, if properly employed, is the best friend of the English landed proprietor.

A FORGOTTEN EXPERIMENT.

THE walls of Roman and Italian buildings were adorned with paintings from an early date. Whether the art was derived from Greeks or Etruscans we need not now inquire. It is sufficient to say that VITRUVIUS, in giving directions for performing the work, describes fresco-painting as if it were well established in his time. In one place, no doubt, he says that *fresco* was the kind of painting adopted in maritime cities for the outsides of buildings and other uncovered places, and which, according to PLINY, was invented by LUDIVS. But commentators believe that PLINY was referring to distemper paintings, which are only superficial and unlike true frescowork, in which preparation is made in order to have the paints absorbed

The elaborate procedure which was advised by VITRUVIUS is enough to prove that the kind of painting which came under the direction of an architect would be out of place on an uncovered wall. He shows how the roof is to be constructed of timber which will not warp, such as box, oak, cypress, juniper, olive, and the pieces are to be united by strong nails for that purpose. If the roof could be constructed of brick it would be preferable to one of timber. Some of the means to be adopted for keeping the roofs secure do not correspond with modern practice, and the value of the recommendations of the Roman architect cannot be judged.

VITRUVIUS advises very great care to be taken with the preparation of the walls for the painting. According to him there should be several coats of sand, crushed marble and lime. It was pointed out that PANÆUS, a brother of PHIDIAS, covered the walls of the temple of Elis with lime and marble mixed with milk and saffron. The milk was supposed to make the lime more solid and whiter, while the saffron imparted a pleasing odour. A writer on a technical subject usually supposes his readers are so well acquainted with a process or a stage of one, it is not necessary to furnish details. Great as was VITRUVIUS he could not be free from the weakness. While writing so much about plastering or stuccoing the walls, he does not inform us how the Roman frescoists kept the surface wet while laying on their colours, nor how they were able to complete the painting before the plaster dried.

As to colours, it is evident the painters could have an ample palette. Traders brought them from Egypt, Spain, Lemnos and other places. Besides natural colours, there was a supply of others obtained by simple chemical processes. Both on materials and preparatory operations VITRUVIUS supplies useful information, but he does not condescend to write such a chapter as a contemporary frescoist could dictate, and in consequence the part of his treatise relating to fresco is somewhat disappointing. A like judgment is applicable to other parts. We recall the instructions of VITRUVIUS in order to suggest that fresco-painting as practised in Italy was in an early age a difficult and tedious manner of painting. The very few books which were written on the subject in subsequent times also reveal that work had to be performed slowly and deliberately. It is no wonder impatient artists could not endure the delays or intervals, and that more expeditious methods were sought. The slacking and mixing of lime required, it was believed, about three months at the least. In taking every other step time had also to be respected. In fact, fresco-painting was an admirable discipline in patience, and we can easily understand how some painters were irritable and disposed to quarrel, as if they were seeking to be rid of their contracts and their lives.

Unattainable as fresco may now appear to us, the Italians had reason to become tired of its excellent qualities. It was everywhere presenting its dull surfaces. Pope JULIUS was to be excused when he besought MICHEL ANGELO to enrich the Sistine Chapel with colours and gold, as the effect of fresco was that of poverty. The reply of the artist about the prophets having been holy men who despised riches was hardly the explanation which met the objection. And we know that gold can still be traced in the ceiling. The way in which fresco was quickly superseded in the eyes of ordinary Italians by oil-painting suggests that grandeur, when accompanied by severity, is too much for weak humanity.

We have no intention of entering on the difficult subject of the origin of oil-painting in Italy. Whether ANTONELLO DA MESSINA was a pupil of the Fleming VAN EYCK, or whether, as VASARI believed, ANDREA DEL CASTAGNO assassinated DOMENICO VENEZIANO, who was possessed of the secret, we need not inquire. It is sufficient for our purpose to know that whoever first used oils in Italy created a revolution. Easel pictures were commissioned to an extent that must at the time have appeared incredible.

The new art, as we may call it, was adopted not

only by the greatest men of the time, but by young artists to whom the expedition of the process was a recommendation. Compared with fresco it seemed a pastime, for in laying on oils upon canvas there were none of those unexpected failures which arose from the contest between limes and sands and different varieties of each. The painters in oils considered that they could without difficulty undertake fresco with as much success as their predecessors. But we have the testimony of VASARI that they were deceived. According to him, fresco demands more force, more assurance and more resolution than is attainable by working at easel pictures, and it cannot be denied that the decadence of Italian art was marked by a decline in fresco-painting.

The forgotten experiment which is the subject of this article was connected with an attempt to make painting in oil supersede the ancient fresco for mural work. Everyone who has visited the National Gallery knows the painting of *The Raising of Lazarus* by SEBASTIANO DEL PIOMBO. To most people it is disappointing, especially when they learn that it was designed by the great MICHEL ANGELO, and was an effort to diminish the glory of RAPHAEL by the union of Venetian colouring with Florentine modelling. We can also see a portrait of SEBASTIANO in company with a cardinal of the MEDICI family. Another work is a portrait of GIULIA GONZAGA. The painter lived in Venice, and began his studies in the atelier of JOHN BELLINI. Then, attracted by GIORGIONE's wonderful colouring, he became a disciple of the younger painter. He was invited by CHIGI, the banker, to aid in painting the Farnesina Palace, and went to Rome for that purpose. There he became acquainted with MICHEL ANGELO, and was accepted as a disciple, if not a partner, of the great master. He was fortunate in obtaining a lucrative office in the papal Court. In the old days, when patents enriched the law officers in England, a man who took out a patent for a safety-pin had to pay a big fee to the deputy sealer and the deputy chaff-wax. In Rome the seals were made not of wax, but of lead, and the painter therefore held an office analogous to our chaff-wax and sealer. Many an artist in the early part of the sixteenth century must have envied him.

We have said that SEBASTIANO considered that oil-painting could be made to endure on walls as well as fresco. He was not the first to make the experiment in Venice. DOMENICO VENEZIANO and others had produced works in that medium. But they were not sufficiently acquainted with the chemistry of art to prevent the colours from blackening and the painting assuming an appearance of age. SEBASTIANO's attempts were more successful, for they appear to have endured in their original state not only during his life but up to a later time, and it was therefore supposed by some sanguine artists that he had succeeded in accomplishing a feat in which many painters could rejoice. VASARI was one of those who believed in the discovery, and he gives the following account of the means adopted by the painter:—"SEBASTIANO used very great and many precautions in his preparations for these works, forming his intonaco with mastic and pitch from the pine, all mixed carefully over the fire and laid on the wall, where it was laid smoothly with a trowel, and covered with a surface of plaster brought glowing from the fire. By this process his works have been enabled to resist the effects of damp and escape all evil consequences from humidity, insomuch that they preserve their colours admirably well and without suffering any change. With the same mixture SEBASTIANO worked on peperino marbles of different kinds, vari-coloured stones, porphyries, and other very hard surfaces, paintings which may without doubt be expected to endure for a vast period of time. He has besides hereby taught us how we may paint on silver, copper, brass, and other metals." The most important example of the new system which has survived is *The Scourging*

of Christ in one of the chapels of St. Peter in Montorio, in Rome. It also is supposed to have been designed by MICHEL ANGELO; and although the colours are faded the general effect is as striking as that of many another work executed in the more ancient manner. It was impossible for SEBASTIANO to paint all his pictures on walls. But he met the demand for smaller works, and at the same time adhered to the principle by using slate which he prepared in his own way. According to VASARI, he introduced ornaments in his paintings which were made of coloured stone, and which were supposed at the time to add to their beauty.

The number of the examples of what might be called his own system is not very great. But that is not to be taken as evidence that his works were not admired. The painter was an easy-going man, and having interest, he was able to look forward to a comfortable settlement, and fortunately for him his expectations were realised. But he did not produce in Rome more works than were necessary. Like all enthusiasts, he believed that his method of mural painting was better than any of those in which the traditions of centuries were embodied. Although he was so deeply indebted to MICHEL ANGELO, he did not hesitate to advise the Pope to have *The Last Judgment* painted in oil-colours, contrary to the intention of MICHEL ANGELO, to whom the commission had been given. The wall was prepared according to SEBASTIANO's directions, but the great master declined to let a brush touch it. After a delay of several months the coating had to be removed, and then MICHEL ANGELO had it prepared in his own way. His rebuke to his meddlesome friend is well known, for he declared that oil-painting was merely an art adapted for women or for idle people like Fra BASTIANO. There was a breach between the two, and it is doubtful whether they were ever fully reconciled. SEBASTIANO died in 1547, or sixteen years before the painter of *The Last Judgment*.

ART EDUCATION IN IRELAND.

THE following evidence was given before the committee of inquiry by Mr. William Orpen, an Irish painter, who received part of his training in the Metropolitan School of Art in Dublin:—

The Chairman: You have been good enough to come here to give your views upon matters affecting this inquiry, which is with regard to the Royal Hibernian Academy and the Metropolitan School of Art. I don't know upon what particular points you will give evidence, and therefore I would rather leave it to you to give us your views as to the Metropolitan School of Art?—Witness: Well, the only views I can give are in relation to the course they pursue in teaching the students. I was taught there myself for six years, so am speaking from personal experience. I have also seen the working of art schools in Paris and London. When I was in the Metropolitan School of Art here it was under the control of South Kensington, whose method of teaching the fine arts, I can confidently assert, is utterly bad: the Metropolitan School of Art has got a large grant of money, and better buildings than generally exist in England and France for art teaching. Soon after I left it was taken away from South Kensington, I understand, and put under the Department of Agriculture and Technical Instruction, and they were given a splendid opportunity of doing something for Irish art. I came to Dublin some three years ago to conduct a summer course in life drawing for teachers. I found that the school still prepared pupils for the South Kensington examinations, and had not availed themselves of the opportunity of breaking away from that system. It is ridiculous to have industrial arts as well as the fine arts under the head-mastership of one man.

Do you think that up to a certain point the teaching in the Metropolitan School of Art is on the right line?—I think perspective and geometry are well taught. When it comes to the fine arts and painting—I am not talking about sculpture—it is quite a different thing. Mr. Sheppard, the sculpture master, himself an artist, visits the school three or four times a week, but he is, I understand, the only teacher who attends under an arrangement like this. If he were offered a mastership, like the others, requiring all his

time, so that he could not go on with his own work, he would refuse it. They won't get an artist to give up his life to teach in a school—to give up his art, if he has any art in him. Even Mr. Sheppard, I understand, has not got a free hand. He is under the head-master, who is under the inspector, and he, in turn, is not free, being under the higher officials of the Department of Agriculture, which knows nothing about painting and sculpture. I consider that the only method of teaching the school well would be to have a separate teacher and visitor for each subject, each with full control of his own branch, the general business being done by a secretary. I understand that the expense of the school—the money that is given by way of grant to it—not taking into account site, rent, lighting or heating, but just the holding of the school—is 4,000*l.* a year on an average. When you come to the Academy, you find that they get 300*l.* a year to maintain an exhibition and their school, which is absurdly inadequate. I think there should be one good school in Dublin. I heard something about healthy rivalry, but there won't be enough materials to make two good schools.

The Earl of Westmeath: I don't quite know what you mean by the South Kensington method?—The method comes down to this. They take a student into the school and they train him to be what they call an "art teacher." The people who train him have gone through the same course and have become "art teachers." He, in his turn, will probably train the next generation to become "art teachers." The idea of training a student to be an artist, who produces works of art, never seems to enter their heads. The one object of the students in their schools is to become a student in training and to blossom into an "art teacher," a business in which a student, however dull, can always make a living. I can understand an art critic being a help to an artist, but he cannot teach painting. A painter is the only person who can teach painting. When I was here for six years I was kept nine months at one figure. They worked me up to get a gold medal. They simply wanted in a particular class of work that the student should be first. That is one of the objections to the South Kensington system. In all the other branches it is exactly the same. If there were visitors I do not think they should be necessarily Irishmen. I am not so national as all that. Whistler has said that art is cosmopolitan. It would be well if we had American artists, and English, Scotch and French artists to come to Ireland to work out an art centre. There is no reason why English artists should not teach here. Why not bring the best people? But I do not think you will get any artist to come here to take it up for more than one season each. A most important thing is that the modern pictures should be close to the school.

The Chairman: You mean a collection of modern pictures?—Something of the kind should certainly be in Dublin. It is very difficult for students, especially beginners, to understand the Old Masters. The whole thing has changed. The best modern painters have picked all they could from the Old Masters, and it would be much easier for students to learn from the modern painters at the beginning. It is much better for them to have painters of their own time before them. My idea of a school would be to have a managing secretary and visitors for each branch—the best they can find—English, Irish, Scotch or French. It doesn't matter what nationality they are.

The only school in England that is worked on that principle is the Slade School?—Yes, so far as I know, except the Royal Academy schools. At the Slade they have very able artists visiting two or three times a week—Professor Brown, Henry Tonks, Wilson Steer and W. W. Russell. The school is managed by a secretary.

Mr. Holmes: Do you think there should be one school?—I think so.

Mr. Boland: Do you mean one life school?—One school for all kinds.

Do I understand that you would not like to see the Royal Hibernian Academy exist as a separate body?—In my opinion it is not material whether the name of the Department of Agriculture or that of the Academy is put over the door.

But the Royal Hibernian Academy is at present a separate institution; would you like to see it continue a separate institution, or be fused in the Metropolitan School of Art?—I would like to see the School of Art fused in the Royal Hibernian Academy. It has a better title than the School of Art. I don't mind by what name it is called. But at there be one school. At present the School of Art belongs to the Board of Agriculture.

The Chairman: But they have an income to keep it up properly?—4,000*l.* a year would keep up any school.

Would there be an advantage in having the school under the control of artists?—Yes, it should be under the control of artists. It is absurd to have artists under the control of a Board of Agriculture. Why not let the artists control themselves?

Mr. Justice Madden: Is the point of your suggestions that it should be the School of the Academy—is that the matter underlying your evidence?—It should be under the control of artists. I don't mind their getting outsiders to teach if they like. Let it be a good school. It must be under somebody; and it would be much better to have it under the Academy than under the Board of Agriculture. They had their opportunity and they missed it.

What degree of supervision did South Kensington exercise in its time?—It had the appointment of the teachers to begin with. They had also a system of inspection?—Oh, yes, they send inspectors over. I inquired this morning about the present inspector. His only distinction is that he is an Associate of the Royal College of Art; but whether he is a painter, a sculptor or a bootmaker I could not ascertain. Mr. Sheppard is a very good teacher, but he is not his own master. This inspector can dictate to him about sculpture, and to my knowledge does so. He would do much better if he were his own master. Another objectionable thing is that the masters have to sign their names in a book, and if they are late they have to explain. It is absurd. It shows how little the interest the teachers take in their work is trusted by the officials above them.

The Earl of Westmeath: Supposing that one of the visito's neglected his duty, who should call him to account—that might happen?—That would be a thing to be settled. There is no doubt an artist teaching ought not to be tied down to minutes. The only place I know to be worked on proper lines is the Slade School, and I never hear of any hitch, or of any person not turning up to do his work there. They all have a great interest in the school.

The Chairman: Do they give what time they have for love of the school?—No; but most of them lose money by leaving their work.

Part of the subject of our inquiry is the question of the present position or site of the Royal Hibernian Academy, and the whole question of its exhibiting side—have you anything special to say on that point?—The site of the Royal Hibernian Academy is not good at present. Of course they cannot do anything with the money they have got, nor can they do much in the way of inviting works with the money they have got. If they invite works they have to pay for them and insure them, consequently they invite very few. I think it would be a great thing if they could invite much more foreign works here. The students have no idea of many of the great painters. If they had more money they could bring pictures over and let the students see good art.

The Earl of Westmeath: Do your remarks apply to painting only?—I don't believe in any person going outside his own province. I want to stick to painting. I think what I have said about the school and the teachers, and the way they are paid, applies exactly the same to the others as well as to the teachers of painting. If a man is teaching stained glass he is not making a living by it, and he will probably give up all his time to the school.

Mr. Justice Madden: Where did you study; was it in London?—Yes. I went to the Slade for a couple of years, and then studied myself in the National Gallery.

You said that when you lived here your education was not an artistic education?—No; it was very good for a very young child, but it did not do for a person beginning to think for himself. It was not nearly free enough. On the contrary, there is very much red tape in the School of Art education. You must not be tied down too much. You cannot be told that you must work from ten till four. People refuse to be forced—nature goes against it.

Chairman: Is there anything else that strikes you?—Well, as to the question of this teaching in the provinces, it is a puzzle to anybody. I came over and taught one of these classes of life drawing for teachers from the provinces for one year. Teachers from the country in Ireland came up to be taught for three weeks. They got paid by the Government for doing this badly; and I can honestly say that not one of them had the faintest idea of art. How these people are teaching I don't know, whether they are getting any good from their pupils or doing harm. Teaching a person who has no taste for drawing is practically a

waste of time. They seem to think that people should waste their lives in learning how to draw cubes. Hundreds of men come in and draw cubes, but I walked round one day and saw that none of the cubes were square. Why should they be wasting the teacher's time—our time and money?

Of course, that criticism of the present system may be quite right, but we have to come to the difficult question of what can be put in its place?—You are not talking of the School of Art now.

Mr. Justice Madden: You are talking of a matter that came under my notice elsewhere. When the elementary teaching of art in primary schools was started an attempt was made—rightly or wrongly—to get a certain number of teachers educated up to a certain point by learning in the School of Art, but you don't seem to think that that was very useful. They did not acquire sufficient to become capable teachers?—I don't think so.

Mr. Holmes: I think you said that not one of them that came under your notice was in any sense an artist?—Yes.

Mr. Justice Madden: Before you leave the subject of the teaching of art and the development of art in Ireland, I should like to ask you whether you think the present movement is likely to be useful, if men educated up to a certain point were to teach promising pupils in the primary schools, without wasting time on persons who have no talent—isn't it the only way in which the possible artist can be found in Ireland?—That is the difficulty. I fear that the present teachers are not capable of even recognising talent, far less an artist, if they chanced on one.

If the "mute inglorious Milton" has not been taught to read and write he must remain inglorious; and doesn't the same principle apply to the bringing out of the latent artistic talent of Ireland?—It might be stopped by bad teaching.

It is an interesting subject akin to our inquiry. The idea is, by a certain general training of hand and eye in the primary schools, to find the pupils who have a certain amount of taste. These are to be brought up here by bursaries, and ultimately educated as artists. Your criticism is very valuable as to the present existing methods; but does this general idea commend itself to your mind?—The general idea of what?

Of teaching pupils in the primary schools enough of drawing to give them an opportunity of showing if they have any talent in that direction, and of dropping art teaching if they haven't—isn't that the only way in which a general movement in the direction of art culture can be generated in the country?—Art is taught in every public school, and practically I think that would be quite enough.

Mr. Boland: What about the national schools in the country? Was it always taught there?—I am not sure.

Mr. Justice Madden: You don't think that any good result is likely to come from the amount of art teaching that is now given in the primary schools?—Not in the way in which it is given. I don't think the teachers are capable of seeing an artist. Don't send any man who merely passed for a certificate.

The Earl of Westmeath: No genius has yet been discovered by this system of teaching.

Mr. Justice Madden: Then your idea is that real artists should be used if art is to be developed through the country?—Most certainly.

And you would give access to good pictures in local exhibitions?—Yes, if good pictures could be sent all through Ireland.

Mr. Russell's Evidence.

Another Irish artist, Mr. George Russell, in the course of his examination said, in reply to the Chairman:—I was asked about five or ten minutes ago to come here, without my ideas being very clear on the subject; but I understand it is the reform of the teaching of the Hibernian Academy and of the Art School. I had experience in both. I was an art student a number of years ago, and went through the School of Art and the Academy. With regard to the Academy, my opinion is that as far as art, pure and simple, is concerned, apart from design, the Academy is the proper place for that teaching to be carried on, and I think assistance should be given to it to do so. But it should be on the condition of supervision being exercised over the way in which the money is spent. When I was an art student there I painted round the life. There were four visitors, who were Academicians. I understood that they had some fee for visiting. One visitor, Mr. Duffy, is an excellent landscape-painter and I have a great admiration for his

work. Another was Mr. Gray, who painted bulls and cows; the third was Mr. William Osborne, who painted cats and dogs; and the fourth was Sir Thomas Farrell, who did not paint at all. These gentlemen, not one of whom painted figures, were put there to assist us in our work. They never put their fingers on the students' work, which was probably the best thing they could have done under the circumstances. They left us very much to ourselves. I don't know what they are doing at present, but if they get assistance, there should be some guarantee that the older Academicians shall not swallow up all those fees amongst themselves unless a fitter selection of visitors was made. The only member of the Academy whom I would regard as a competent teacher is Mr. Orpen, and if assistance were given, to make it worth his while to come and visit the school, it would be a most desirable thing. But I would not be at all in favour of assisting them unless I was sure that some competent person would be there to visit the school, and not persons who have a reputation for painting something other than what they are to teach.

As to the School of Art, I think they ought to divide art, as applied to industry and design, and so forth, from pure art teaching. I think you cannot have very good teaching when you have somebody to do it who is employed rather as a clerk—going round from ten to three and from seven to nine, and spending all his time in that way. He loses all spirit; and, while he may be competent to teach mechanical courses and freehand drawing, it is not desirable to have a person of that kind when you come to painting from the life. I think a visitor would be sufficient for the purpose, someone who would come on two days in the week, on Tuesday, when the students begin painting, and perhaps on Friday. That would be quite sufficient, because people learn more from each other than from the teacher. What you want is a fresh eye. A man who has been going round all day has nothing fresh to say. Mr. Hughes, who is a very competent sculptor and a man of genius, told me that the great difficulty he felt all day long was having anything fresh to say. He felt that his presence was not required all the time, but he was forced to spend so many hours every day at the school. Mr. Hughes is a man of genius, and no man of genius would give up his time permanently to that work. He would have been quite willing to spend a certain number of hours there, which would have left him time to carry on his own work. No painter will give up all his time, and for that reason the life class in the School of Art should not be put under the charge of the permanent officials, but of some competent visitor, who should be asked to visit on two days in the week, for a couple of hours, as in the French studios, where they get a distinguished artist to come for a few hours and give advice. That is really what is required.

The Chairman: Supposing that the life school of the Metropolitan School of Art was controlled and administered in some such way as you propose, would you suggest that there should be going on at the same time a life school under the Hibernian Academy?—Well, theoretically, I should say that there is not room for both; but practically I would like to see it, and, if there should not be efficient management in one, I would like to have the other as an alternative. I do not think that Ireland produces enough artists for the two schools, but under present conditions it is an alternative from one school to another.

It has been suggested to us that the life class of the Metropolitan School of Art is necessary for the highest part of the education of those who are going to apply their art as designers, but that the purpose of the teaching there is somewhat different from the purpose in the Academy school, which is intended to produce simply painters of pictures by profession. Do you think that is so, that they diverge a little?—Yes, of course, they do diverge afterwards; but, as far as drawing from the life is concerned, it must mean the same thing. When a model is before you, no matter what you do afterwards, you must draw it as accurately as possible. If you have a model before you, your purpose is to copy it as exactly as you can; how you may apply it afterwards is another question. I think, perhaps, the ideal plan would be to make the technical school in Kevin Street do a great deal of the work that the School of Art does at present. There is no reason for overlapping. I understand that a great many of the students who used to go to the School of Art go to Kevin Street. If they could make the School of Art an art school, pure and simple, the Academy might take charge of the school here. The School of Art rooms might be used for Mr. Lane's collection of

pictures. There would be no better way of helping the students than to enable them to see good pictures.

Mr. Boland: The Metropolitan School is not meant for Dublin alone, but for Ireland; it has to do work for the whole of Ireland, and it would not do to send part of the work over to the technical school in Kevin Street?—Oh, yes; perhaps so.

Mr. Holmes: They have to train teachers for the whole of Ireland, and that could not be well done in Kevin Street?—I don't know whether the question of a new site for the Academy enters into this inquiry.

The Chairman: Yes.—Because I heard that a great deal has been said about the unsuitability of the site of the Academy. I think that was quite absurd. The Academy is unfortunate, because the people who are managing it at present have not sufficient energy to make it popular. When Mr. Lane brought his loan collection to the Academy he made it very popular, and a great number of people came there. Any person with a talent for managing affairs could make the Academy as popular as if it was in Merrion Square. You have an admirable site in the National Gallery, but who goes there? The position has very little to say to it. It depends simply on the energy of the people who manage. Mr. Lane could make an exhibition popular in the slums of Dublin.

Provided that the building was a good one.—I think their site is very suitable, and the only reason why I wish them a new building is in order that Mr. Lane might have that building for his collection. I am sure he would make it more popular than the new Academy would be.

Mr. Boland: Do you think the present building is sufficiently lighted?—I don't think they require the inner room at all. They have so many bad pictures that one room would do.

Mr. Holmes: Would you like to improve the school accommodation there?

The Chairman: They say they can't do any drawing from the antique because they have only got one room.—That is so; but as the room below is not required for half the year they could turn it, while the Exhibition is not on, into a room for drawing from the antique. The Exhibition goes on for a couple of months in the year, and then the large room is vacant. I don't think the inner room is required, unless they insist that a great number of very bad pictures should be exhibited every year.

Mr. Justice Madden: Whether they are good or bad, nobody can see pictures there.—It is no advantage to have them there at all. The room might be made useful for the painting class.

The Chairman: There is this consideration which I would put to you. In the Royal Academy of London and in the Scottish Academy they depend to a great extent for their revenue on the number of people who attend and pay their shilling, and on the number of persons who come in to buy. From that point of view do you think the question of a site unimportant?—It would be difficult to say. I think that with really effective management it would be as attractive as if it were in Merrion Square. I think it is because the management of the Academy is very defective. There are any number of things that they could have done. They had the Loan Collection, but they left it to Mr. Lane to do the work. It was their business to have done it. I myself suggested a loan collection of pictures about seven years ago, and it paid its expenses.

The Works and Stores Committee of the Metropolitan Water Board have had before them the question of the terms and conditions of employment of the workmen in the employ of the Board, with a view, if possible, of securing uniformity throughout the service. They found the matter one of extreme difficulty owing to the greatly varying conditions which existed in the areas of the water companies. In this connection, too, it was necessary to take into consideration the question of the desirability and practicability of adopting trade union terms and conditions. The committee invited the men in the various districts to elect representatives to confer with certain members of the Board in order that they might have the views of the men themselves. A conference accordingly took place on November 13. The question which acquired special prominence was as to whether the Board should endeavour to bring all the men in their employ under trade union terms and conditions, or whether the present terms and conditions should continue. Upon this issue it was decided to take a ballot of the men, and the result of the ballot was that 2,888 were in favour of continuing the existing conditions of employment and 49 voted for trade union terms and conditions.

NOTES AND COMMENTS.

THE proposal to reconstruct the Pont Notre-Dame in Paris has more than usual interest for archæologists. The cathedral, it need hardly be said, stands at one extremity of the island on which the earliest settlers established themselves, and between it and the surrounding city several bridges have been constructed. The Pont Notre-Dame leads from the Rue Saint-Martin to the Rue Saint-Jacques, and must have been a part of the earliest thoroughfare. In the thirteenth century there is a record of a wooden bridge in the same position. It was rebuilt in 1413, and, as with other bridges, sixty houses were erected on both sides of the roadway. In 1499 bridge and houses collapsed. It was then resolved to provide a bridge of masonry. About that time the Dominican Friar GIOVANNI GIOCONDO was in the Quartier Latin lecturing on the works of VITRUVIUS. He was selected as "reconstructor of stone edifices" out of a number of architects, and was entrusted with the erection of the new three-arched bridge. It seems incredible that in the beginning of the sixteenth century there were no houses on the island of Notre-Dame, and it was arranged that the stone should be quarried there, and the centrigs and other timberwork repaired. The bridge took five years to complete and cost 1,160,000 lire. On both sides was a row of shops and houses four storeys high. The houses were taken down in 1786. The bridge was the most ancient of all in Paris, and in 1793 the name was changed and it became the Pont de la Raison. The piles on which the bridge stood were not removed in 1853, when Giocondo's bridge was reconstructed. The river near the bridge is difficult to navigate, and it is proposed to substitute a steel arch of about 190 feet span for the three arches over the central part of the river. At the same time the bridge will be widened.

THE following important resolution was adopted at a meeting of the Royal Hibernian Academy:—"The Royal Hibernian Academy, having considered the two reports of the committee appointed to inquire into the art institutions of Dublin, express their entire approval of the report as presented by the minority, and their dissent from, and rejection of, the report of the majority of that committee, and will reject any offers based on the recommendations as made by the majority, if proposed." The report of the majority recommended that money should be granted for repairing the existing buildings of the Academy in Lower Abbey Street, that a new charter should be granted reducing the number of the Academicians from thirty to fifteen or twenty, and increasing the Associates from ten to twenty or twenty-five. It was also recommended that teaching should be no longer carried on in the Academy building, and that a professorship of painting should be established in connection with the new Life School at the Metropolitan School of Art. The minority recommended the erection of a suitable building for the Academy which would also serve as a gallery of modern art, and that the increased income from exhibitions and the sale of pictures would enable the Academicians to add to the efficiency of the school. Also it was suggested that if further aid is given to the development of art it could not be devoted to a better purpose than to enable promising art students to complete their education in the Academy. The majority of the committee considered that hereafter it might be possible for the Academy to resume its life school. But for the present, owing to the paucity of qualified students and to the character of the teaching, it was considered that the Academy would most effectually aid in co-operating with the Metropolitan School of Art. Official authority appears to be opposed to the Academy. The students, if Mr. RUSSELL can be taken as a representative, are not favourable to the Hibernian Academy system, and the people of Dublin in general seem indifferent whether the Academy remains in its present position or is removed to a more central site.

FOR the extension of the Council House, Birmingham, of which the late YEOVILLE THOMPSON was architect, 124 sets of sketch-plans were submitted. Sir ASTON WEBB and Mr. INGRESS BELL were appointed assessors, and they selected ten designs for the second competition. The design by Messrs. H. V. ASHLEY & WINTON NEWMAN, 10 Gray's Inn Square, W.C., was placed first, and the selection has been approved by the City Council. The style adopted is Renaissance, and the estimated cost of the work is 150,000/.

AFTER expending over 30,000/ in replacing decayed stone in the new municipal buildings, Glasgow, it was only to be expected that much deliberation would be exercised in the selection of stone for the Mitchell library in that city. Mr. W. T. OLDRIEVE was consulted, and he has recommended the use of a stone from Blackpasture, in Northumberland, treating it with preservative liquid as a precaution. The use of an English stone in a Scottish town seems to be like carrying coals to Newcastle, and the stone in question has been used in only one public building in Glasgow. It is said to be a very hard stone, and costly to work, and therefore is not in favour with contractors. One of the official clerks of works says of it:—"It has two qualities which enable it to withstand the action of the atmosphere of Glasgow better, I believe, than any white freestone now in the market. It is highly silicious—97.5 per cent.—and it is very dense, absorbing very little moisture. There are good stones among the 'new red' sandstones of Annandale, but their weakness is their porosity. They absorb so much acid-laden moisture from the atmosphere of Glasgow that they perish very soon." It is claimed, however, that Lochaber stone, which has been used with advantage in some Glasgow buildings, contains 97.88 per cent. of silicious matter insoluble in acid.

A PROPOSED LONDON CHURCH.

ST. JOHN'S COLLEGE, BATTERSEA.—THE NEW DINING HALL.

THIS college, founded between fifty and sixty years ago as a National Training College for King's Scholars, has, under the present energetic principal, the Rev. H. WESLEY DENNIS, M.A., been practically remodelled, and so far as much of the new work is concerned, can lay claim to being quite equal to many of the colleges of the Universities. The addition shown in the two views was, owing to the nature of the site, an extremely difficult one to execute, much of the older work having to be underpinned or shored up. The work consists of the buttery stores, pantries and larders, the hall, with music, staff and other rooms beyond. The hall and buildings are connected up by a wide corridor. The work has been carried out by Messrs. JENKIN & CO., of Mitcham Lane, Streatham, to the designs of the college architect, Mr. A. H. RYAN-TENISON, F.R.I.B.A., 12 Little College Street, Westminster, S.W.

LAON, FROM THE ARSENAL.

HOUSES, 18 TO 23 HYDE PARK PLACE, W.

IN each of these houses the design has been varied. The accommodation consists of:—*Basement*.—Kitchen and servants' offices. *Ground floor*.—Two large reception-rooms (one of sufficient size to take a full-sized billiard table), service lifts to kitchen, hall and lavatories. *First floor*.—Two large reception-rooms. *Upper floor*.—Ample bedroom accommodation. The elevations are in red brick and stone. The internal decorations are in some of the houses of an elaborate character. Messrs. MYRING & Co., of St. John's Wood, were the contractors, and the work has been carried out from the design and under the supervision of Mr. E. KEYNES PURCHASE, of 20 and 22 Maddox Street, W.

PAIR OF SEMI-DETACHED HOUSES AT BECKENHAM
FOR G. E. THOMSON ESQ^{RE}
WILLIAM A. BURR M.S.A. ARCHITECT.
65 CHANCERY LANE W.C.

HOUSES, ELMERS END, KENT.

IT is proposed to erect these semi-detached houses in Gwydor Road, Elmers End, Kent, for Mr. G. E. THOMSON. The lower portion will be in bright red brick; the upper portion rough-cast. The roofs tiled and woodwork painted white, except the barge-boards and front entrance doors, which will be finished dark green. The drawings have been prepared by Mr. WILLIAM A. BURR, M.S.A., architect, 65 Chancery Lane, W.C.

LEWISHAM AND LEE.

By W. F. POTTER.

LEWISHAM, called in ancient deeds Levesham, derives its name from its situation, Leves or Leswes in Saxon signifying pastures and ham a home or village. It was given with its appendages of Greenwich and Combe by Elthruda, niece to King Alfred the Great, to the abbey of St. Peter at Ghent, to which Lewisham then became a cell or alien priory, which grant is said to have been confirmed by King Edgar in the year 964, and by King Edward the Confessor in 1044, with the addition of many privileges and immunities.

In Domesday Book this manor is thus described, under the title of the possessions of the Abbot of Ghent:—"The land of St. Peter of Ghent. In Greenwich hundred. The Abbot of Ghent holds Levesham of the king, and he held it of King Edward the Confessor, and it then was and now is taxed at two sulings. The arable land is 14 carucates. In demesne there are 2 carucates and 50 villeins, with 9 borderers, having seventeen carucates. There are three servants and eleven mills, with the rent of the socmen [inferior tenants who held cottages and land by service of country work or hard labour]. The whole amounting to 8*l.* and 12*s.* Of the profit of the haven 40*s.* There are 30 acres of meadow. Of wood, pannage sufficient for 50 hogs. The whole manor in the time of King Edward was worth 16*l.*, and afterwards 12*l.*, and now 30*l.*"

William I., commonly called the Conqueror, and several of his successors confirmed this manor and its appendages to the above abbey, with which they remained till the suppression of the alien priories throughout England by the statute of the second year of King Henry V., A.D. 1414, when they became vested in the Crown, and were the next year settled by the king on his newly-founded house or Carthusian Priory of

Bethlehem, of or near Shene (now called Richmond). Notwithstanding which King Henry VIII. found means to secure the surrender of them, *i.e.* the manor and rectory and advowson of the vicarage of Lewisham, and annexed them to the Crown in his twenty-third year. After which this king on September 5, in his twenty-ninth year, granted the stewardship of this manor, with others in the neighbourhood, to Richard Long, one of the esquires of his body, for life, with the yearly income of 7*l.* 6*s.* 8*d.* and all profits and emoluments belonging to it. On his death King Edward VI., in his first year, by his letters patent, July 17, 1547, granted the above office to Sir Thomas Speke, knight, for life, with sundry fees and emoluments therein mentioned; and again on his death, he granted the same on December 24, in his fifth year, to Sir Thomas Darcy, K.G., and Lord Darcy, of Chiche, for life, with the same emoluments as in the former cases.

John, Earl of Warwick, eldest son of the Duke of Northumberland (who was beheaded by Queen Mary), afterwards possessed this manor, on whose attainder it escheated to the Crown, from whence it was in the fifth year of Queen Elizabeth granted to his brother, Sir Ambrose Dudley, who had been restored in blood by Queen Mary, and on December 25 in the fourth year of Queen Elizabeth had been created Baron Lisle, and the next day Earl of Warwick. He soon after exchanged it for other lands with that queen, and she in 1575 granted this manor and rectory for forty years to Sir Nicholas Stoddard, of Mottingham, which term expiring in 1605, King James I. granted another lease of the same for forty years more to Sir Francis Knolles, knight. He being a person very zealous for the Reformation was much esteemed by Queen Elizabeth on that account, so much so that in the first year of her reign he was made one of her privy councillors, and shortly after that vice-chamberlain of her household, next captain of her guard, afterwards treasurer

of her household, and lastly K.G. He married Catherine, daughter of William Carie, Esq., and had issue by her (who died in 1568, and was buried in Westminster Abbey) several children, of whom William, the eldest surviving son, was in the first year of King James I. created a baron by the title of Lord Knolles of Grays, in the county of Oxford, and within a short time after K.G., and in the fourteenth year of that reign he was raised to the dignity of a viscount by the title of Viscount Wallingford, and in the second year of King Charles I. he was created Earl of Banbury. King James, after granting the above-mentioned lease, granted the fee simple of this manor and rectory to John Ramsey, Earl of Holderness. It afterwards came into the hands of the Legge family, whose present representative is the Earl of Dartmouth. He is the present lord of the manor and proprietor. His eldest son is Viscount Lewisham.

Lewisham consists of one long main street nearly two miles in length, situated on the east side of the river Ravensbourne. It was during the occupancy of the Dudleys that Queen Elizabeth is said to have visited it, but the inhabitants did not pay her that homage to which she considered she was entitled, and on leaving it one morning very early, and finding no display of flags or banners or any one to greet her, she lost her temper and described the place as "Long, lanky, lousy, lazy Lewisham," and it has frequently borne this royal title of the town of five L's ever since. I can find no proof of this tradition, but I must say it is not at all unlike a saying of "Good Queen Bess."

Catford is a manor in the parish of Lewisham, and was anciently the inheritance of a family of the name of Abel, who dwelt at Heringhill in Erith; one of whom, John Abel, had a charter of freewarren for him and his heirs, for his lands here at Lewisham and in Hatcham and Camberwell, in the twenty-third year of King Edward I., A.D. 1294.

Soon after this it came into the possession of Anthony Beke, Bishop of Durham, at whose death it came to the Crown. Edward III. granted it to Sir William de Montacute, knight, and his wife Katherine in tail with remainder to the king, as a reward for his having apprehended Roger Mortimer at Nottingham, and other special services; and he obtained the next year a charter of confirmation for the freewarren in his manor of Catford. This manor afterwards became part of the possessions of the newly-founded chantry or college of St. Lawrence Poultny in London, most probably by the sale of it to Sir John Poultny, knight. The manor of Catford remained in the possession of this college till its suppression in the reign of King Edward VI. It afterwards came into the possession of the Dukes of Montague.

Sydenham was formerly called Cypenham, and first became celebrated in 1681 through a treatise published that year in London by Dr. John Peter, physician, and another was published in 1699 by Dr. Allen, both giving accounts of some springs of medicinal purging water. These springs were at the foot of Sydenham hill, and are described as being about twelve in number.

Lewisham Church is dedicated to St. Mary. It was from earliest accounts an appendage to the manor of Lewisham, and as such was given by Elthrua, King Alfred's niece, to the Benedictine Abbey of Ghent, in Flanders, which was confirmed by several of our kings. In the year 1774 Lewisham Church, requiring great repairs to support it, and becoming too small to accommodate the numerous inhabitants of the parish, a resolution was taken by the then parishioners to apply to Parliament for power to rebuild it. Accordingly an Act was passed that year to enable them to do so, in pursuance of which the old church was pulled down, and a new one was erected on the same spot. It was almost entirely destroyed by fire on Christmas Day, 1830, since when it has been repaired at the expense of the inhabitants. It will accommodate 1,200 persons, and has a square tower at the west end and a portico on the south side, supported by four Corinthian columns.

Lewisham Priory.—On the grant of the manor of Lewisham and its appendages to St. Peter's Abbey at Ghent, in Flanders, by Princess Elthrua, King Alfred's niece, the abbot and convent built a mansion here, afterwards called the Priory of Lewisham, under the government of one who had the title of Prior, and being thus connected with St. Peter's Abbey, it was esteemed a Benedictine cell or alien priory to it. This, as already said, was suppressed in the second year of King Henry V., A.D. 1414. And, as also stated, this was again finally

suppressed at the dissolution of all monasteries by King Henry VIII. in his twenty-third year.

Mr. John Thackeray, of Lewisham Priory (a mansion near the south extremity of the village), has erected a neat range of buildings comprising six almshouses, nearly adjoining the priory, and has endowed them with 10*l.* and 1 ton of coals per annum to each.

Colfe's Almshouses.—Abraham Colfe, vicar of Lewisham, who died December 5, 1657, founded during his lifetime two free schools, one for teaching youth English, and the other for teaching them Latin, the oversight and government of which he committed to the Company of the Leathersellers of London. He likewise founded an almshouse in this parish, and in the sixteenth year of King Charles II. an Act was passed for settling the charitable gift of Rev. Abraham Colfe, clerk, for erecting and endowing two free schools and an almshouse at Lewisham in Kent. This freehold school is now commonly called the Blackheath school, and maintains "a good reputation [says Hasted] for learning and the education of youth."

Margaret, first wife of Jasper Valentine and afterwards of Abraham Colfe, left an annual gift to the poor of this parish. She died, and was buried in Lewisham Church, March 15, 1642.

Ladywell, situated a quarter of a mile west from the church, was a chalybeate spring formerly much recommended. It took its name from our lady St. Mary, the patron saint of the church.

Brockley, a village one mile west of Lewisham, was formerly haunted by a famous highwayman called Brockley Jack, who was caught and hanged on a gallows or gibbet near the roadside inn, his favourite house of call, a very quaint inn which afterwards bore his name, but which has recently been rebuilt.

Outside the Roebuck, another very quaint inn at Lewisham, which has been recently re-erected, there formerly stood the oldest æsculus, or horse-chestnut tree, in England, planted in 1683, and was the parent tree of all those in Bushey Park. Many of the cottages in Lewisham were formerly built entirely of wood, but most of them have since given way to more substantial materials. I had occasion, for instance, a few years ago to take down a small wooden cottage in Peartree Court, Loampit Vale, which had caught fire and was nearly consumed, to rebuild the same in brickwork, exactly 12 feet square, with one room on the ground floor and bedroom over, and w.c. I believe this to be the smallest house in London, and was built complete for the sum of 60*l.* In taking down the old house I was anxious to discover whether there were any antiquities or relics underneath, but all I found was a brass farthing dated 1837, and marked on the reverse "To Hanover," and on the obverse was the head of Queen Victoria.

Respecting Colfe's Almshouses there was a well-founded rumour a short time ago that these old cottages were about to be sold and pulled down, but, owing to the strong opposition of the Society for the Protection of Ancient Buildings, I am pleased to say that the idea has been abandoned. Sydenham has also become famous for its well-known Crystal Palace, erected there since its removal from Hyde Park in 1851, but which is too well known to require a description from me in this paper. Its fine art courts, however, might form the subject of another paper at a future time.

Lee.

In the time of William I. Lee was part of the possessions of Odo, Bishop of Baieux and Earl of Kent, of whom it was held by Walter de Doway. It is thus described in Domesday Book under the general title of the "Bishop's lands":—

"Walter de Doway holds Lee of the Bishop of Baieux. It was taxed at half a suling. The arable land is 4 carucates. In demesne there are 2 carucates and 11 villeins with 2 cottagers having 2 carucates. There are 2 servants and 5 acres of meadow. There is wood for the pannage of 10 hogs. In the time of King Edward the Confessor, and when the Bishop received, it was worth 3 pounds, now 100 shillings. Aluuin held it of the king."

As early as the reign of King Edward I. this place was the residence of an ancient family called Bankwell, which probably acquired that surname from a place in this parish formerly written Bankwells, but now by corruption called Bankers. In the thirty-first of that reign, A.D. 1302, John de Banquel had a grant to him, Cicele, his wife, and their heirs, of freewarren in all their lands in Lee, Lewisham, Bromley and in Brokisham. In the first year of King Edward II. John de Banquel was appointed one of the Barons of the Exchequer, and in the return of John de

Shelving, sheriff of the county, in the sixteenth and part of the seventeenth year of that reign, of all the knights and men-at-arms within it, William de Banquel is mentioned in the second degree. He died in the twentieth year of King Edward III. A.D. 1345.

Lee Church is dedicated to St. Margaret, and was opened March 11, 1841. It is designed in the Florid Gothic style, and consists of nave, chancel, side aisles, with tower and spire. It will accommodate 1,000 persons, and stands on an eminence near Blackheath, on the opposite side of the road to the old church. Among other monuments and memorials in the old church was one in brass to Elizabeth Conkyl, dated 1513, and on the north side of the altar a sumptuous monument, with the figures of a man lying in armour and his wife lying at full length, for Bryan Anslye and Awdry, his wife. On the south side of the altar was a monument, with an effigy in brass, of another man in armour, kneeling at a desk with a book open before him and an inscription in black letter, for Nicholas Ansley, sergeant of the cellar to Queen Elizabeth.

The most eminent person, however, buried here is Dr. Edmund Halley, the celebrated astronomer, who lies buried under a plain tomb in the churchyard. He was born at Haggerstone, November 8, 1656; his father was then a rich soapboiler, of Winchester Street, city of London, though later in life he became in somewhat reduced circumstances. Halley was sent to St. Paul's School, and in 1673 he entered Queen's College, Oxford, as a commoner. Without waiting to take a degree he made a voyage to St. Helena in 1676, and while there, in the following year, he made the first complete observation of the transit of Mercury. In 1678 he returned to England and presented to King Charles II. a planisphere of the southern constellations, including Robur Carolinum, which he added. As a reward the king issued a mandamus to the University of Oxford for him to receive the degree of M.A. In the same year at the age of twenty-two he became a Fellow of the Royal Society. In 1682 he married Mary, daughter of Mr. Tooke, auditor of the Exchequer, and they lived at Islington, and then in Golden Lion Court, Aldersgate Street, City. He acted as assistant secretary to the Royal Society, and from 1685 to January 1, 1693, he audited the "Philosophical Transactions," to which he contributed many papers. In 1696 he was appointed deputy comptroller to the Mint at Chester, and later William III. gave him the command of the war-sloop, the *Paramour Pink*, with which he explored the Atlantic. In the same ship, by command of Queen Anne, he inspected the harbours of the Adriatic, and assisted in fortifying Trieste. He devoted considerable attention to comets, and Peter the Great consulted him as to shipbuilding. In November 1703 he was appointed Savilian professor of geometry at Oxford, where he was created a D.C.L. He was familiar with many languages, and while there translated a work by Apollonius from the Arabic into Latin. On Sir Hans Sloane's resignation in 1713 he became secretary to the Royal Society, and in 1721 was appointed astronomer royal in succession to Flamsteed, who had a very unfriendly feeling towards him. He died on January 4, 1742, and was buried in Lee churchyard as I have stated. He is more popularly known from his paper entitled, "A Discourse tending to prove at what time and place Julius Cæsar made his first descent upon Britain." This appeared in the seventeenth volume of the "Philosophical Transactions," and fixes the first date in English history from this circumstance:—"Cæsar having mentioned the fourth day after his landing, says the night after it was a full moon." This would be August 30, and from this Halley fixes the date of Cæsar's landing at Deal, in Kent, August 26, B.C. 55.

A stratum of shells runs through the parish of Lee, and is about 7 feet thick. A small rivulet takes its rise in this parish, and formerly on sudden rains rose to near 10 feet in height, and after watering the parish flowed into the river Ravensbourne in the adjoining parish of Lewisham. The Ravensbourne takes its rise at Keston near the Roman Camp, where Aulus Plautius, the prætor, awaited the arrival of the Emperor Claudius Cæsar, as mentioned by Dion. The tradition of the origin of the name of the river Ravensbourne is thus described by Hone in his "Table Book":—"When the Roman general encamped here his troops were in great need of water, and none could be found in the vicinity; observing, however, that a raven frequently alighted near the camp, and conjecturing that it was for the purpose of quenching its thirst, he ordered the coming of the bird to be watched for and the spot to be particularly noticed. The result was as anticipated. The raven's resort was a little spring, from which Aulus Plautius derived

water for his Roman legions; and from the circumstance of its discovery the spring was called the Ravensbourne, or brook." Of course all this is quite hypothetical, but the water was formerly in repute, like other springs around here, for its medicinal virtues, and was used to bathe in.

THE ARCHITECTURE OF SICILY.*

(Concluded from last week.)

The Mosaics.

FERGUSON says, "The north needed acute brilliancy [of colour] as a contrast to external greyness. The south found rest from the glare and glow of noonday in these sombre splendours. Thus Christianity, both of the south and of the north, decked her shrines with colour. With the Greeks colour, though used in architecture, was severely subordinated to a calculated harmony with actual nature; it did not, as in a Christian church, create a world beyond the world, a paradise of supersensual ecstasy, but remained within the limits of the known" ("History of Architecture"). Whatever our ecclesiastical views of the wisdom of the Emperor Leo III.'s iconoclastic decree in the eighth century, as artists we cannot but rejoice that the Western Church retained her full freedom as to the use of colour and form.

The decorators of the late period of the Roman Empire well understood pictorial mosaics in marble, and we have very beautiful examples in Rome of this work, in the apse of S. Prudenziana, executed in the fourth century. The ground was then mostly in blue, very little glass was used and the figures were thoroughly Roman in type. When the seat of empire was transferred to the East in 330 Constantine's liberal patronage of the arts in Constantinople, and particularly of mosaic amongst so artistic a people, soon brought the beautiful art to perfection.

When in 402 Honorius transferred the capital to Ravenna, this town produced the finest mosaics of the earlier period, up to the middle of the sixth century. S. Sophia was also completed in this century. Although some good examples can be seen in Italy, proving its continuity with varying success, and in spite of the set-back resulting from the iconoclastic movement, it was not till the eleventh and twelfth centuries that the great revival came, of which S. Mark's, and a little later those in Sicily, are so eloquent. The earlier mosaic work in S. Mark's, late tenth century, is, however, hard and rigid in detail, compared with that executed in the twelfth century in the same church, and at Torcello and here in Sicily.

In no spot in the world can the principles and methods be more successfully studied than in Sicily, those of S. Sophia being largely hidden from view behind Mohammedan whitewash or destroyed, and much at St. Mark's having been restored out of recognition or having given place to imitations of painters' art.

These decorations of the Palermitan churches represent the zenith of Byzantine mosaic art of the Second Period. Nothing finer had been done before, even at S. Sophia or S. Mark's, Venice. Nothing so fine followed, and the ambition of the Renaissance painters to reproduce their naturalistic art in this permanent form, thus divorcing it from the conventional limitations imposed by the material, was soon to destroy tradition and its practice. It is only in our day emerging into new life by the discovery of its true principles of design, method of fixing, and by the revival of the manufacture of the enamel-glass by such firms as Messrs. Powell, while Sir William Richmond, Messrs. Crane, Anning Bell, Clement Heaton, Spence and others are working on the right lines, and already giving us good work, both internal and external, in spite of many adverse conditions. A school of mosaic workers is thus arising in England which we anticipate will lead the art in Europe, and we may hope that before the Westminster Cathedral mosaics are commenced the empirical stage of the revival will be passed.

These Sicilian mosaics are kept sufficiently distant from the eye to prevent an unpleasant sense of the coarseness of the material and its joints and to blend its irregular lines and surface into a rich and harmonious whole, full of variety and accidental beauty, while the scale of the figures and geometrical ornament is large enough to be read pleasantly by the multitude worshipping in the church. The lighting is arranged with great skill to answer the latter purpose, but is not sufficient to kill the colouring, and the windows, always of plain white glass, are generally in

* A paper read by Mr. W. H. Seth-Smith at the meeting of the Architectural Association on Friday, December 14.

such positions as to secure diffused rather than direct light, and low down to give profundity and richness to the surface above.

The Byzantine style is the architecture best suited to its display of this decoration, since the curved surfaces of its domical vaults produce the maximum effect in gradation of light and shade, and the greater the width of the building the better is the effect. This explains the supremacy of S. Sophia at Constantinople. Mr. Anning Bell contends that the stiffness of drawing is not archaic, but the expression of the material, and says, moreover, that play of facial expression and momentary gesture are out of court, and that such subjects as depend on these are unsuitable. The characters should be types and the incidents symbolic. Mosaic can be magnificent and splendid, but not humorous. A row of Popes is meant not for likenesses of individuals, but to impress the spectator with the continuity and power of the Papacy.

The method of execution employed in Sicily and elsewhere in Mediæval times was as follows:—A coat of fine lime mortar was spread on the wall, upon which, when fresh, the picture was broadly painted in fresco in the proper colours. The painter was immediately followed by the mosaicist with the cubes, which were embedded in the soft mortar and pressed to an even surface.

Here and in the interior of S. Mark's, Venice, the decorations enjoy the necessary freedom from rivalry with architectural features, such as mouldings and stone enrichments, which disconnect the scheme and look poor and mechanical in juxtaposition, unless the carving is of very special delicacy to harmonise, as it does fairly well, for instance, in S. Vitale at Ravenna, and in the atrium of S. Mark's, and as it does not at St. Paul's, London. In these Sicilian Norman churches the mosaics cover the entire wall surfaces, domes and vaults, and even the angles of the archivolt are all rounded off to carry it to the soffits of the arcades. The ground is nearly all of gold, not the hot yellow gold of modern mosaics, but low-toned, soft, rich, never flashing, full of play of colour from pale lemon to rich orange (according to its lighting), and the decorative designs are bright in tones that do not give the effect of patches of dark on a light ground. The palette used is a very limited one, greys and grey-blue, violets, soft greens, madders, with scanty use of silver, dark reds and russets. In fact, nature's scheme of colour at her most beautiful and restful season of winter, a scheme deliberately adopted and perfectly adapted to the heat and glare of the climate. The size of the cubes averages nearly an inch square for the larger surfaces and about three-eighths of an inch for faces, hands, &c. The Mediæval method of cutting up the cakes of enamel-glass with chisel-like hammers produced the great irregularity in the cubes which, with their corresponding variety of joint and surface, gives such subtle charm to old work, compared to the modern machine-cut cubes. It is obvious such a material must impose limitations on the drawing and texture.

Much valuable and practical information on ancient and modern mosaics will be found in three papers by Messrs. Harrison Townsend, Anning Bell and Clement Heaton, in the "Journal of the Royal Institute of British Architects" for March and November 1901, and April 1902, besides, of course, the larger standard works.

The cathedrals of Messina and Cefalu are both nearly contemporary with the Cappella Palatina, both having been commenced by King Roger about 1130. Of the former only the general plan and the mosaics of the three apses remain substantially as they originally were. The basilican plan has the usual characteristics of the Norman Sicilian cathedrals. Saracenic influence is shown in the slightly horseshoe form of the nave arches.

Cefalu.

Cefalu is a church of great interest. Here is the south Italian porch in three vaulted bays between two angle towers. The nave arcades are high-stilted on columns of polished red granite, with white marble bases and varied capitals, many from older buildings. The clerestory, as at the Cappella Palatina, has a single-pointed window over each arch. The transept projects beyond the aisle walls; the central bay was domed, though now ceiled by wood beneath. From the east wall of this transept open three very deep tribunes, the central one covered by groined vaults, and each ending in an apse as usual. The Lombardic open arcaded gallery on three sides of the transept, and just beneath the vault with small round arches, is the only example of this feature in Sicily. The most striking

feature of the church is the very lofty choir opening into the nave. There is nothing like it south of the Alps.

I reproduce a measured plan and elevation of the apsidal end of this church from Mr. George Hubbard's paper read before the Society of Antiquaries, and published in "Archæologia," vol. lvi. He has established the date of commencement as being 1132, and of the completion of the nave roof as 1160. He also suggests the interesting theory that the occasion of the marriage of the daughter of our Henry II. to William the Good, of Palermo, gives the clue to the origin of the earliest pointed arches in England, namely, those of Trinity Chapel and Becket's crown in Canterbury Cathedral, then just commencing. The church possesses some very fine cloisters, which he well describes.

The painter Mr. Wallace Rimington thus writes of the interior:—"The whole body of the church being white, the eye is led up to the choir. Once there it remains there, and dwells with intense satisfaction on the glorious wealth of colour with which the chancel is enriched by mosaics. These are, on the whole, the most impressive of any I have seen in Italy. The harmonies of colour are mainly in violet and brown madder, accentuated with low-toned green and grey. The apse is entirely dark, except for one small glazed window which brings a small quantity of high light into contrast with the principal dark of the church, and taking the eye at once to its central interest. In its vault, and just where the play of reflected light is at its best, is a great dominant half figure of Christ, quiet, dignified and splendid in subdued colour. Its effect at the end of the church is most impressive. Our Lord is raising the right hand in the act of benediction—still the same Lord that looked down upon the generations who knelt in this great church all through the Middle Ages. It is difficult to believe that any one of that multitude could have entered the church without having gained some better idea of the love and majesty of the divine Master from this noble mosaic."

Palermo and Monreale Cathedrals.

An interval of nearly fifty years seems to have elapsed between the building of the churches already described and the two great cathedrals of Palermo and Monreale, the only additional examples of the splendour of Norman church architecture in Sicily. These were built under King Roger's successors, William the Bad and William the Good. Palermo had a previous cathedral, begun in 1109 on the ruins of a Saracen mosque. A year or two after the accession of William the Bad, Walter of the Mill (amusingly Italianised as Offamilio) became archbishop, and rebuilt the cathedral, leaving, however, some eastern parts of the old church. It was finished in 1185, and was doubtless one of the most beautiful in Sicily. The eighteenth-century transformation has, alas! left little or nothing except the general ground plan, and not all of that, a new east end having been built within the old. The plan is similar to Cefalu, without western porch and towers. The three tribunes are, however, here connected by a broad arched opening, forming them into a sort of second transept. The nave arcades were of pointed arches over four slender columns set in a square, and joined by their bases and abaci into a singularly beautiful pier, and above the arcade the clerestory was pierced by three-light pointed windows divided by columnar mullions. The ceiling was of wood decorated with gold and colour, and the whole interior was magnificently enriched with precious marbles and mosaics. The four slender towers, one at each angle of the church, are a unique feature, and although picturesque in general form they are unsatisfactory in detail, especially in the multiplication of coarse string-courses running under each sill and springing of each arcade. The main angles are all shafted. Some of the stages had their surfaces inlaid presumably with black and white patterns in marble and asphaltum in Saracenic patterns, the incision now only remaining, and curious superficial Saracenic parapets occur over some of the string-courses and dog's-tooth ornament below them. The circular angle turrets commence about half-way up. All this splendour remained till 1781, when the royal architect, Fuga, in spite of the strenuous remonstrance of the Palermitan architects, ruthlessly destroyed it. The frigid silence of the Palladian style reigns within, simple indeed and dignified, but lifeless as the century in which it flourished.

The cathedral of Monreale externally resembles that of Cefalu, with flanking towers at the west end and a deep porch in three bays. The southern tower has a low pyramidal spire. The external face of the south aisle shows a range of pointed windows surrounded by thin bands of mosaics, and united by broader flush arches

enclosing circular patterns with horizontal bands. A frieze of inlay runs beneath the cornice. The clerestory is absolutely plain with an arched corbel table under the eaves. In the east end the characteristic external decoration of the style is even more lavishly displayed than in the apses of the cathedral of Palermo, and is certainly one of the most striking compositions in Italy. The entire surface is covered by a series of interlacing arcades of pointed arches. The upper stages are covered with geometrical inlay of marble and asphaltum, and the walls are further enriched by horizontal bands and circles of the same character. There are few exteriors in Europe possessing a surface decoration of equal richness.

Before passing to the interior something more should be said as to the bronze doors.

The art of casting in bronze had been a lost art in Italy for several centuries, but was revived by the Greek artists in the eleventh and twelfth centuries, the earliest examples of bronze doors being those at Amalfi and Atrani, of the last half of the tenth century, and between 1066 and 1087 seven churches in Italy were thus furnished from the Byzantine capital. In most the treatment was large panels with various designs, generally simple, all executed in niello, with incised lines filled in with silver, &c., the frame of the panels being more or less decorated. The bronze was in comparatively thin plates on a framework of solid oak. The eastern inspiration was caught in time by the Italian workmen, the earliest being executed in Italy by Roger of Amalfi for the chapel of Bohemund about 1120. As subjects became more ambitious niello decoration gave way to reliefs cast on the plate. In 1160 Barisanus made a magnificent pair of doors for Trani Cathedral, and somewhat later for the cathedrals of Ravello and Monreale; the panels in all three are almost identical in subject and design, and are of prodigious variety, sacred and profane.

In addition to Barisanus's pair in the north doorway, Monreale possesses magnificent bronze doors in the west or principal entrance by Bonanno, the maker of the great doors of the Pisa Cathedral, and the architect of the campanile there. Though the two makers are almost exactly contemporary, the work of the Pisan architect is archaic in style—the panels without mouldings; the sculpture of the panels is in very high relief and spirited in character. The work of Barisanus is more harmonious; the foliage, though rigidly conventionalised, is appropriate to its enclosing bands and carefully subordinated to the figure sculpture of the panels.

The interior is more fully windowed than the Cappella Palatina, and its decorations are of surpassing magnificence. The scheme, both in subject and in general colour, is precisely that of the Cappella Palatina, but the scale of the building, and its breadth of treatment immensely enhance the effect. The walls throughout are here again lined to a height of 22 feet with narrow vertical slabs of Cipollino grey and white marble framed in borders of Cosmati work, and with a Moorish frieze in the same material. All the smaller surfaces, including the jambs of the windows, the bull-nosed angles, horizontal and arch bands and the soffits of the arches, are of semi-geometric patterns, and the whole of the walls and apses are covered with pictorial mosaics, the subjects being scenes from the Old and New Testaments in horizontal ranges, divided by bands. The whole semi-dome of the central apse is occupied, as at Cefalu, by a gigantic half-length figure of Christ, which dominates the whole scheme.

The beautiful carved caps of the nave arcade anticipate the best Renaissance capitals, but are not so suitable to the style as those of Ravenna, for instance, as supports to the heavy stilt-blocks from which the stilted pointed arches spring. Low-toned red lines mark apparent archivolt to the arcade, the band beneath the clerestory windows and the arches being treated with semi-geometric Byzantine patterns of green-greys and soft russets and madders with a small amount of white. In the lower range figure subjects are grouped into the spandrels of the arcade and the gold ground is well massed round them. The figure subjects between the windows are similarly treated, while the white guilloche in a continuous band just beneath the roof is filled with busts in white, indigo-grey and a little red and madder brown. Generally speaking, the greys predominate in the figures, producing, broadly speaking, with the gold ground a palpitating surface of yellow and grey, than which nothing is more beautiful. The greens and blues are very grey and the reds and browns also of a neutral tint and in small quantities to prevent a hot effect where so much yellow exists. These greys are splendidly

focussed at the east end by the indigo mantle of the colossal figure of the Christ. This mantle is thrown over a tunic of gold and madder red, the highest light being the linen wrapped about the neck and throwing up the head finely, the face being very pale and surrounded by dark hair and beard.

In these days of the universal knowledge of the Bible it is difficult to imagine the educational value to the illiterate multitude of this complete pictorial record of the evolution of revealed truth culminating and centred in this fine figure of Our Lord.

The pavement of the nave is not so rich in line or colour, but only serves more effectively to concentrate the attention on the principal decorations, but that of the chancel more than atones for the plainness of its approach.

Little is left of the conventual buildings except the cloister, which was perhaps, in its best state in respect of its mosaic and sculpture, the finest in Italy. Each alternate pair of the coupled columns have plain shafts, the others being decorated with mosaics in vertical flutes or spirals or chevrons. The capitals are infinitely varied, and wonderfully designed and carved. At the angles of the cloister the columns are in groups of four and the shafts covered with reliefs of beautiful design rather Byzantine in character, while the capitals are still more elaborate. The arch heads are, like every other portion of this cloister, of extreme richness. The inner arch moulding, however, is the one inharmonious note, stopping abruptly, as it does, overhanging the abaci of the caps. This is evidently one of those errors which it is difficult to account for, as there is no evidence that this feature was not contemporaneous. A similar fault is to be seen in the cloisters of Cefalu. The lavatory of the monks is a most graceful feature of this beautiful cloister, and a gem of art. These triumphs of ecclesiastical architecture were the work of Saracen builders, assisted by Byzantine, Italian and Norman craftsmen.

With the Norman work of the eleventh and twelfth centuries the development of architecture in the southern provinces of Italy comes to an end. In the great Gothic movement of north Italy, in the greater Renaissance movement which followed it, the south had no part. It was anticipated in Italy.

Of the remaining Palermitan churches, S. Francesco, 1302, and the contemporary S. Agostino are as to date Gothic churches with many Norman details, and are worthy of more attention did time permit. Then there is the late sixteenth-century church of S. Maria della Catena, of which I give a photograph of the front and a pencil sketch of the beautiful late Gothic interior. Here the columns of nave are of Cipollino, black and white veined, red and a grey marble, and all polished. The carved caps and bases are all white marble touched with a little gold, with good effect; the surbases are of hard limestone. The walls internally are faced with rich brown sandstone varied with yellow and grey. The effect of the three-centred ribs to the barrel vault of the aisles is exceedingly pleasing. The windows are all small and have no tracery. Grey marble bands follow the line of the arcade in the pavement, the remainder being squares of about 18 inches of greyish Sicilian marble. The triumphal arch finds its abutment in similar arches across the transept.

Renaissance.

Something might also be said of the Renaissance churches with which the town abounds, and of the Rococo inlay decoration in marbles of many kinds, the whole producing a sense of ostentatious wealth and of riotous imagination totally at variance with the solemnity and dignity of public worship.

Domestic and Civil Architecture of the Norman Period.

Up to this time the only domestic architecture in Europe, with very rare exceptions, has been that of the military castles. But in Sicily the examples of the luxurious Arabs were too attractive, and the arts which had been so lavishly employed in the Church were turned to account in beautifying and softening the domestic life. Palermo became a second Cordova, with palaces, villas and pleasure pavilions standing in parks and gardens, with fountains and statues. Only the Torre della Nisfa remains of the royal palace, containing a large hall which still bears witness to the interior luxury of the king's house. Even as early as the first quarter of the twelfth century the walls and the groined vault were all adorned with mosaics.

The Saracenic characteristics of the baths at Cefala (about 20 miles south of Palermo), are, with slight modifications,

those of all the Norman civil buildings in Palermo. The earliest were two pleasure palaces built by King Roger about 1120 for use in summer and winter respectively. Of La Fava, the winter villa, little remains excepting the interesting little chapel. The palace stood within grounds planted with citrons, oranges and palms, and the whole enclosed within a great moat in which floated the gilded gondolas of the king and ladies of his court. The summer palace, known as Minenio, was two miles west of the town.

The more familiar examples of this Norman-Saracenic style are the two palaces built by William the Good and William the Bad, the Ziza and the Cuba, in which the Normans adopted the Saracenic domestic architecture and the kindred arts, especially that of formal landscape gardening and the use of water.

The Ziza, built of ashlar brown sandstone with close joints, measures 115 by 62 feet and is 80 feet high. There are three nearly equal storeys marked by small string-courses. The central arch of the principal front is 30 feet high, and the inner order is carried on coupled jambs of fine marble. In the lower half of each arch was originally a coupled pointed window with a smaller window between the arch heads, and the wall was crowned by a parapet the divisions of which were filled by Cuphic inscriptions, and enclosed, as in the baths of Cefalà, between two horizontal bands of Byzantine carving. The central arch leads through a vaulted vestibule into a hall about 22 feet square, with a deep recess on each of the three sides. These recesses are covered by elaborate Saracenic vaults, as at the Alcazar at Seville and the Alhambra at Granada, and their walls were faced with mosaics and plates of marble. These decorations remain in part. The central hall and vestibule have the height of two storeys. The space on the sides of the building is divided into apartments communicating with each other by ample staircases. The palace stood in the midst of pleasure gardens. Opposite the main entrance was a fishpond surrounded by a square pavilion, which has now disappeared like that of the Cuba, which still remains. The Arabic inscription on the parapet of the Cuba gave the date of the building as 1182. The planning of this royal villa appears to have closely resembled that of the Ziza. Of the various pavilions adorning the grounds La Cubola only remains.

A curious hiatus in the art of Sicily is the almost entire absence of architectural wrought-ironwork of any merit, ancient or modern. The best I saw was in the screens between the chapels and the nave in the cathedral of Ortigia (Syracuse). This is the more curious considering how beautiful is the ironwork used to adorn the axle-trees of the carts in many of the towns, notably in Palermo (where they are also profusely decorated in colour) and in Taormina.

The architecture of the Normans in Sicily covers a period of little more than half a century. Yet in that time it had exhibited a logical consistency and a wonderful union of strength and grace. Strictly speaking, the style had no development. No architecture ever expressed more fully and clearly the peculiar character of its age and people. The strength of the Norman, the fineness of the Greek, the luxury and grace of the Arabian were exhibited not more conspicuously in the social and political fabric than in the churches and palaces the Williams left to their unworthy posterity.

Weary as we all are of the battle for the supremacy of the styles and of theories for the development of a twentieth-century manner of work, may there not, however, be fresh food for reflection in the cosmopolitan tolerance and studied collaboration which within fifty years resulted in the creation of the unique and lovely architecture which has been our theme to-night? And since we have been so recently bade to "think Imperially," does not our empire contain all the elements, if intelligently organised and sympathetically handled, for the production of something at least equally admirable? At the present moment an English architect is executing a commission in our richest eastern dependency which appears to offer a unique opportunity for combining the scientific genius of Europe with the splendour of Oriental taste in form and colour, in commemorating the reign of the best monarch of the leading empire of the world. It ought to rival, if not excel, the Taj Mahal.

Mr. R. PHENÈ SPIERS, in proposing a vote of thanks to the author for his paper, said there were many present who had a closer acquaintance with the subject than he had, though he must have seen Sicily before they did, since it was in May 1864 that he spent a visit there. There were many points however in the paper which he himself could

substantiate. Mr. Seth-Smith appeared to be doubtful regarding the Eremiti church, and had been astonished when he was told by the guides that it was originally built as a mosque. Some time ago, said Mr. Spiers, he came to the conclusion that although one of the walls belonged to a mosque, the church itself was built for Christian use. He had, too, in his possession a drawing showing the actual church and the original mosque. In conclusion Mr. Spiers thought there was much more to be learnt in Sicily by the architectural student than in other parts of Italy; the position of the temples was magnificent, and they were of extraordinary interest and beauty. The paper had been so carefully prepared and admirably illustrated that he derived great pleasure in recognising scenes he visited forty-two years ago.

Mr. RONALD P. JONES seconded the vote of thanks, and asked why the paper had not dwelt upon the Grecian temples in Sicily; they certainly merited attention, and he believed that even the approach to the Acropolis at Athens could not have been finer than the approach to the temples at Girgenti. The paper, in referring to these remains, had mentioned their adornment by some coating which had been coloured. The material used was limestone, which only followed the lines of the architectural stonework underneath; the limestone had received the polish of natural marble, and it was quite erroneous to describe the material as plaster. The temple at Segesta was never finished, and it therefore provided a grand example of how Greek temples were constructed, besides being the finest instance of magnificent effect obtained by the simplest forms.

Mr. GEORGE HUBBARD, F.S.A., said that though he had not visited Sicily as long ago as Mr. Phenè Spiers in 1864, he had, however, perhaps spent more time there, for he stopped nine months in the island during the year 1884. He thanked Mr. Seth-Smith for his most excellent paper, which so aptly dealt with the peculiarly complex period in the development of architecture in Sicily, and for having thrown upon the screen some drawings of Cefalù Cathedral which he (Mr. Hubbard) made many years ago. In this Norman cathedral of Cefalù Mr. Hubbard considered that the earliest example could be found of the pointed arch in a purely Norman building. Sicily was conquered by the Normans in the latter quarter of the eleventh century. The conquerors were familiar with the pointed arch of the Sicilian Saracens, and they adopted it when building Cefalù Cathedral. The cathedral of Cefalù was begun in 1132, and the pointed arch was used throughout, a full generation before it was adopted in any other Roman church in Europe. In the year 1170 Henry II. offered the hand of one of his daughters to William the Good of Sicily. It was not, however, till 1176 that the little Plantagenet princess, then in her twelfth year, was sent to Sicily. The wedding took place in the following year amidst unexampled rejoicings. An architect from Henry's court would no doubt accompany the ecclesiastics and other dignitaries who joined the ceremony. But, apart from historic occasions such as this, and another less auspicious which occurred in the following reign, when Richard I. captured Messina, there were plenty of facilities for English and continental architects to become acquainted with the work of their brethren in Sicily. At this date, although some few pillars of the work at Canterbury had already been raised in their places, not a single arch had yet been turned, the whole of the upper portion having been executed between 1177 and 1180. This work at Canterbury is perhaps the earliest pointed Gothic to which an exact date may be assigned. It therefore seemed probable to Mr. Hubbard that Cefalù may have had a direct influence upon the introduction of the pointed arch in subsequent Gothic work. Cefalù was built by the first Norman king in Sicily, King Roger, and the subjection of the conquered race is typified, not without its pathos, by the four kneeling Saracens supporting the sarcophagus of King Roger, as was shown by Mr. Seth-Smith in one of the many and excellent slides.

Mr. SETH-SMITH, in his reply, said he felt when preparing his paper there would be only sufficient time to deal with one period in Sicily, though there was no part of his tour in the island which gave him greater pleasure than the study of the Classical work.

The Local Government Board have informed the Sheffield Board of Guardians that their architect describes the hospital administrat block as unnecessarily costly, and designed and furnished in a style that is incongruous and inconsistent with its purpose.

THE STORY OF THE SYNAGOGUE.*

THE story of the synagogue is practically the story of the Jewish people from the Babylonian captivity through successive eras in their history in the East and West, with the alternate light and shade, to the nineteenth century of civil and religious liberty in nearly every land. Such a survey would hardly be complete without a detailed study of the rise and growth of the synagogue in the Orient, its gradual spread as the Jews began to colonise outside of Palestine even before the conquest of Jerusalem by Titus, its appearance in Egypt, Asia Minor and Italy, and then in Central Europe and Spain. A careful inquiry, too, would investigate the influence of climate and conditions on synagogue architecture. How much of this was original and how much borrowed, consciously or not? Did its development run parallel with the mosque and church, adopting features from both? Or did it escape wholly foreign influences and develop along its own lines? What, further, was the origin of the synagogue's interior arrangement and what principles underlay its entire construction.

The original synagogue is traced in legend to King Jehoiachin of Judah, who, a captive in Babylonia, founded such a place of assembly in the district of Nehardea. Certainly places of worship of some character must have been established in the land of the captivity, and the institution was probably transplanted to Palestine on the return. Ezra is expressly mentioned (Neh. viii.) as calling the people to prayer and instruction, he himself reading the Law, as he and the heads of the community stand upon a wooden platform in the centre of the assembled worshippers. The intellectual character of the synagogue, which was not for prayers only, was thus early emphasised.

The spread of the synagogue was rapid, even before the final downfall of the temple. It must have been a public necessity, to infer from references in the Talmud to 480 synagogues in Jerusalem which were required for the host of foreign Jews who visited the temple when its sacrificial service was in full swing. Thus in the shadow of the larger house were synagogues of the Alexandrians, Libertines, Cyrenians, Elymaeans and Asiatics. In Egypt, where there lived according to Philo nearly a million Jews, was a famous synagogue, the Basilica, in Alexandria, one of the wonders of its age. Many are the allusions in the New Testament to synagogues in Damascus, Antioch, Athens, Corinth and elsewhere, outside the limits of Palestine, and to Nazareth and Capernaum upon its soil. In the reign of Augustus Caesar Rome had many synagogues, which led to the conversion of some men and women of prominence, as the Romans of both sexes found pleasure in visiting the places of worship, even if in later years the Jew and his festivals became the sport of the satirists. When the Christians of Rome in after centuries burnt down a synagogue and Maximus, the usurper, commanded the Roman Senate to rebuild it at the expense of the State, he was termed in derision a Jew by Ambrosius of Milan. Gradually to the east and the west and the isles of the sea the synagogue spread, and whether by the running stream or seashore, to admit of ablutions, in crowded cities or in forest or deserted village far distant from the track of the caravan, it resisted every attack and became the people's stronghold.

As was the custom among Christian and Mohammedan, the synagogue was often built close to the tombs of famous rabbis or ascribed to them as founders. The celebrated Petachia in his travels, towards the end of the twelfth century, tells of seeing at Nisibis two synagogues erected by Ezra the Scribe, and at Bagdad three, including the one which tradition refers to Daniel. At Tiberias he visited the synagogue founded by Joshua, and at Damascus the four reared by Elieser ben Asariah, a rabbi of the first Christian century. Petachia was no Munchausen, but gave the story as he was told. Alexandria has a so-called Elijah synagogue, which derives its name from the legend that Elijah dwelt for a time on the spot. Into its neighbouring houses weak and ailing Jews and Mohammedans are piously borne in the fond hope that Elijah, who, among other traditional qualities, restores to health, may heal their wounds and infirmities. You can still be shown at Tiberias Rabbi Meir's synagogue, and near Safet the synagogue ascribed to the illustrious Simon ben Jochai.

The list of famous synagogues, while not lengthy, includes some of historic interest. It begins with the basilica of Alexandria, which fell when the prosperous

Jewish community vanished in a sudden whirlwind of persecution (about 110 of the common era). To paraphrase the description in the Talmud, he who never beheld it never saw the majesty of Israel. It was like a basilica, colonnade within colonnade, crowded often with a host of people twice as large as departed with Moses from Egypt. There, too, could be seen golden chairs inlaid with precious stones corresponding in number with the seventy elders of the Sanhedrim, the cost of each seat being estimated at twenty-five million golden denarii. On an elevation of wood in the centre stood the choir leader. Each guild—for the different arts and trades had their separate guilds before the practice arose in the German Mediæval towns, with which it is usually associated—had its own place, so that a stranger might recognise his own trade and join his comrades. The responses of the vast congregation had to be directed by a flag signal—so immense was the edifice.

One is tempted to dwell at length on the varied fortunes of the synagogue and the legends that twine around the old structures, but a subject of wider interest must be considered—its architecture. One might infer from popular impressions of Jewish exclusiveness that the synagogue had its special form of architecture from which a departure was heresy. The fact is there is no distinctly Jewish architecture—it is eclectic and varies with the environment. In Jerusalem an old synagogue has the appearance of a mosque. The interior of the Romanesque synagogue of Regensburg, which centuries ago fell a prey to the flames, had the lines of the cathedral of Spire. The St. Petersburg synagogue has unmistakably the characteristic exterior of a Russian Greek church. Perhaps the Gothic and Moorish in varied modifications are seen most frequently, but although the arch, the dome and the minaret are often presented, the steeple and the belfry are absent. Perhaps the synagogue is hospitable enough to adopt these in the future.

The synagogue ruins in Galilee, dating from 150 to 300 of the common era, are of Roman character in their masonry, moulding and ornamentation—proving how early current styles were adopted. Toledo's famous synagogue, changed into a church in 1405, and known as Santa Maria la Blanca, is built after the most approved Moorish-Spanish design. Its plan is that of a basilica, the ground floor tiled, being an oblong square about 90 by 65 feet, divided into five naves or aisles and subdivided by four rows of octagonal pillars, nine in each row. Horseshoe arches of peculiar Moorish pattern rise from these columns. Over the arches, whose spandrels are carved into elegant rose-patterns, is placed a second arcade, ornamented with pure Byzantine work, appearing like stone-lace. A third series of stalactite archlets rests upon double pillarets, crowned by an elaborate frieze reaching to the roof. This roof, though of wood, has the durability of rock, and, black with age, still show traces of gold ornamentation. The edifice was used as a Magdalen Asylum in 1550, and on the French invasion in 1792 was appropriated for military barracks.

The latest synagogues, built on the broad places of the chief cities and no longer hidden in the narrow Ghetto, represent all styles of architecture. The Classic, the Renaissance, the Byzantine, the Romanesque, with a blending of the Gothic and the Moorish, can be found in all directions. The new synagogues in Szegedin and Temesvar; in Berlin, Strasburg and Cologne; in Florence, Rome and Turin; with similar edifices in Budapest, Breslau, Glogau, Hanover, Königsberg, Munich, Paris, Vienna and Warsaw, show freedom and beauty in their construction. The same variety of style is illustrated in American synagogues and temples.

A word only in this connection as to the interior arrangement that reproduces in certain features the lines of the older tabernacle, which itself suggested interior arrangements in Solomon's Temple. In the centre of the main floor is usually an elevated platform from which the prayers are read. Directly facing the entrance from the vestibule, which is generally at the western end, so that the synagogue may face the east, is the Ark, or receptacle for the scrolls of the Law or Pentateuch, before which is hung a curtain. In the old synagogues there was either a latticed gallery or a special room for women worshippers. In many of the later synagogues, reading desk and pulpit are combined before the Ark, while in reformed American congregations family pews have been introduced, thus doing away with the Oriental feature of the women's gallery. It can readily be seen how Ark, curtain, gallery and columns lend themselves to splendid and unique ornamentation. Although the plastic art has re-

* From an illustrated article by Mr. Abram S. Isaacs in the *Architectural Record* (New York).

ceived little encouragement, carved wood and rich marbles are generally employed, onyx, gold and mosaics being used with fine effect. In the Orient many a synagogue whose exterior is sombre and uninviting has magnificent interior furnishings and decorations. The Italian synagogues, in particular, in a land where artistic genius is almost universal, are remarkable for the costly embroidered curtains and architectural beauty of the Ark, in whose enrichment a generous rivalry is exhibited. In this respect a synagogue appears like a votive shrine, and elaborate gifts, often women's exquisite handiwork, are treasured from generation to generation until they acquire a venerable age, to become a powerful object-lesson to the young, and to the old worshipper matters for pious contemplation.

SELSEY IN SUSSEX.

A LECTURE on "Selsey: Episcopal, Manorial and Parochial," was given at the Chichester Institute by the Rev. J. Cavis-Brown, M.A., rector and vicar of Selsey. He began by relating his disappointment when appointed rector in 1902 at finding no parish records except the registers (the earliest of which was missing) and the tithe map. However, he almost immediately discovered the National School trust deeds, which had been lost for over sixty years, and gradually diligent search in Selsey, Chichester, London and elsewhere had brought to light many other documents relating to Selsey, several of which had now been restored to the parish. The bulk of the records, however, had been lost for ever through the carelessness and ignorance of their custodians. There should be written large on all parish books what was inscribed in the Rotherfield parish account book, "February 26, 1509. To remain in the church and never to be taken home to the churchwarden's house." It should also be forbidden to keep parish documents in the parsonage house, except in a proper fireproof safe. The lecturer, according to the *Sussex Daily News*, then dealt fully with the interesting geological features of Selsey and Bracklesham Bay, showing sectional maps, views of fossils, erratic blocks, early coins, &c. He next told the story of the Saxon settlement A.D. 477, and of the coming of St. Wilfrid, and the founding of the bishopric of Selsey, A.D. 680, and showed the land grant of Oslac, Duke of the South Saxons, in the year 780, with its confirmation by Offa, king of Mercia. The lecturer himself had been the means of finding this charter in 1891 in the cathedral, after it had been lost since the time of Dean Hayley, that is, about 190 years. There were twenty-one bishops of Selsey before the see was moved to Chichester in 1075, and Bernardi's portraits of these with a portrait in their midst of the present Bishop of Chichester, the ninety-second from St. Wilfrid, excited much interest.

The Selsey cathedral was now probably under the sea, more than a mile from the shore, and its only remains were the font, several coffin slabs, and old worked stones in the parish church, besides the ancient sculptures in the south choir aisle and the long chest under the north-west tower of Chichester Cathedral. The Domesday record of Selsey, in 1086, was explained and reasons given for believing that the fleet of William the Conqueror, after the battle of Hastings, had come either to Selsey or Chichester Harbour, or to both, during the advance on London. A most interesting map of the island of Selsey in 1672 was presented on the lantern screen. This showed all the ancient common fields with tenants' arable strips and surrounding common pasture in the marsh, the lord's manor-house, park and demesne, the tidal water mill, the parish church and rectory house, the haven, making Selsey a complete island, the ferry and other features of an early manor. On this map the coast-lines in 1820 and 1905 had been marked, so that the loss of land from sea encroachment from 1672 could be exactly calculated at any point. The sea seemed to have advanced about 6 feet and washed away 3 acres yearly.

The lord of the paramount manor from A.D. 680 had been the bishop, by whose generosity there were also three prebendal sub-manors and the quasi-manor of Medmeney. From the first year of Queen Elizabeth until Charles I. the manor was vested in the Crown, and came into the Morley family (of Halnaker) in 1635. Its descent thence was carried through the families of Elson, Walter, Glanville, Peachey (Barons Selsey) and others to the present time. The different kinds of tenancies and the curious prevailing custom of "Borough English" were fully explained, and the story of the various attempts to reclaim the harbour, completed about 1875, was told. Numerous facsimiles of stewards' accounts, court rolls, parish registers and other

records from the thirteenth to the nineteenth centuries were shown. Views also of the old parish church, which was taken down and rebuilt stone by stone nearer the village in 1866, and of the new church, the old and new rectory houses, the manor-house, the windmill, Bible Christian chapel, &c., made much more interesting a lecture full of valuable history and quaint details. Lists of rectors, vicars, curates and prebendaries were taken back to the thirteenth century, and a nearly complete list of churchwardens had been made from 1530 to 1906. Documents were also presented showing the important part the churchwardens played in the parish until quite recent years. The lecturer finally announced that he proposed to publish next year a "History of Selsey," illustrated with most of the pictures shown that evening.

GENERAL.

The Restoration Committee of Peterborough Cathedral are issuing an appeal for funds to complete the work of restoring the fabric, undertaken in 1883, when the central tower threatened to collapse. Since then nearly 100,000l. has been raised.

Mr. Edward A. Hoffer, architect, 36 All Saints Green, Norwich, has composed and published a march for Christmas which he has called "Alpha and Omega."

Mr. Francis F. Fox, M.I.C.E., has written a letter on behalf of the Government Railway Department of Switzerland to contradict once and for all the disparaging statements which from time to time appear as to the danger and failure of the Simplon tunnel. Mr. Fox will read a paper on the tunnel before the Institute of Civil Engineers on January 8.

Amongst the Wills proved last week was that of Mr. Robert Alexander Bryden, architect, Glasgow, who left 27,551l.; and of Mr. John Thomas Micklethwaite, F.S.A., of 1 Victoria Street and 27 St. George's Square, Westminster, who left 12,265l.

The Edinburgh University authorities state that a gift had been made to the department of engineering by Messrs. D. & C. Stevenson, civil engineers, Edinburgh, of a bust of Robert Stevenson, engineer.

Among the Discoveries in the course of the excavations and renewals at Winchester, the workmen found a yard measure made of boxwood in perfect preservation, with the inches, half-inches and quarter-inches marked, and at the end the figures 36. Tested by the existing yard this old one is slightly shorter; perhaps the wood has shrunk during the long internment. It is difficult to give the age of the yard. Bishop Langton's chantry was finished before his death (1500), and presumably a craftsman forgot his rule, which was buried accidentally.

Sir Andrew Noble, the new laird of Ardkinglas, proposes to carry out the work of restoration on the old castle of Dunderave, near the head of Loch Fyne, in such a way as to arrest the progress of decay, which is slowly but surely reducing this Highland keep to a state of complete ruin. This ancient stronghold was built in 1596, and was the seat of the MacNaughtons, formerly one of the most powerful clans in Argyleshire.

The Antiquarian Committee of Cambridge University recommend that they be authorised to hire an old malting-house at Newnham for a period of five years, in which to store some of the collections under their charge. The need for a new museum of ethnology and archæology is, indeed, becoming pressing. The University has assigned a site for such a building, and a building fund has been started by Baron von Hügel, curator of the museum, but until that fund be very considerably augmented the University will be compelled to store away many of its treasures in a building inaccessible to students and quite unworthy of the treasures it contains.

Mr. Francis Howard has been elected honorary secretary of the International Society of Sculptors, Painters and Gravers, in succession to Mr. T. Stirling Lee.

A Baldacchino supported by eight columns has been set up in the Westminster Cathedral. A new altar consisting of a single block of Cornish granite has also been introduced.

The Hexham Abbey Restoration Committee have accepted the tender of Messrs. Holloway & Co., of London, for the erection of the new nave. The architect's estimate was 22,000l.

Mr. Stanley Selwyn, architect and surveyor, Reigate, has opened offices at 4 Adam Street, Adelphi, W.C.

It was one of the first invented, and is to-day
better than ever, because the Manufacturers have, by
reason of many years of scientific and practical
tests, continually improved its manufacture until
perfection has been attained.Hall's Distemper is made in two qualities—
the inside quality is specially for interior wall
decoration, the outside quality being most
suitable for all other purposes, both inside and
out, whether on wood, stone, brickwork, or
any kind of building material.Its utility for Farm and Estate Buildings,
such as dairy and tool-sheds, kennels, barns,
shooting boxes, and temporary buildings
of all sorts, is remarkable.Full particulars of Hall's Distemper, in
the form of a beautiful booklet, entitled
"Modern Development in House Decoration,"
will be sent post free on application

DOULTON'S "IGNIS" BATH HEATER

IN COPPER.

No. 1497.

Bath heaters are of the greatest benefit in a house even though there is a system of hot-water circulation. The use of gas for cooking, &c., through a great part of the year, saves the ordinary firing and thus stops the hot-water supply. In such cases a bath heater is most serviceable, as a hot bath can be had at any time, at a minimum cost and without any trouble.

To meet this special demand Messrs. Doulton have made a heater that is both cheap in price and lasting in wear.

All parts are made in stout hardened copper, tinned inside.

The water in no case comes into contact with the gas.

Ordinary burners are used for heating instead of Bunsen's or atmospheric.

Cold water is raised 55° in passing through the heater, but water of a higher temperature can be obtained if the quantity is reduced.

The flow of water should be regulated by a stop cock, so as to give the amount of water required and no more,

PRICES.

No. 1497. Polished copper heater to give 1½ gallons per minute £4 15 0

No. 1497A. Polished copper heater to give 2 gallons per minute 5 10 0

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further

answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

DOLGELLEY.—July 14.—The Dolgelley Urban District Council invite the terms of engineers for preparation of a scheme for sewage disposal, &c. The fee for each heading must be stated separately, and must include for all out-of-pocket expenses incurred in visiting the district, and otherwise in connection with the preparation of the scheme and the carrying-out of the works. The Council do not bind themselves to accept any of the terms offered. Mr. Richard Barnett, clerk, Queen's Square, Dolgelley.

OLD TRAFFORD.—July 10.—For a new institution for the Board of Management of Henshaw's blind asylum. Premiums of 100l., 50l. and 25l. The competition will be restricted to practising members of the Manchester Society of Architects and others practising in that city. Mr. J. Holden will act as assessor. Apply for particulars before July 10 (with a deposit of 1l. 1s.) to Mr. J. R. Burne, 1 St. Peter's Square, Manchester.

ON Wednesday a fatal boiler explosion took place at the ironworks of Messrs. Penn & Son, Cradley Heath.

A SERIOUS outbreak of fire occurred early on Thursday morning on the premises in Gray's Inn Road of Messrs. S. Trenner & Son, the well-known shop-fitters.

THE foundation-stone of the church of St. Paul, Leyton, was laid on Saturday last by Mr. Robert Barclay. The church, which is to seat 500, will now cost 5,000*l.*, but it is hoped to complete it later by the addition of a handsome tower according to the original scheme, at a cost of 9,000*l.*

A MEETING was held at Toynbee Hall, London, on Tuesday, when Mr. Imre Kiralfy advocated his scheme for the erection of a museum and library on the site of the Shadwell Fish Market. Mr. Kiralfy also suggested the pulling down of a street of houses and erecting a general market with a large block of workmen's dwellings. This would be a great improvement to the district.

THE Society of Arts' conversazione in the beautiful gardens of the Royal Botanic Society, Regent's Park, on Tuesday last was well attended. The reception by Sir Owen Roberts, chairman, and the other members of the Council was held at the entrance to the conservatory, and a capital selection of music was performed by the bands of the Royal Artillery and the Scots Guards. There were also two performances of selections from pastoral plays, besides a concert and entertainment by Mr. Kirwan's Idyllic Players, and altogether a very enjoyable evening was spent.

TRADE NOTES.

MESSRS. MEASURES BROS., constructional engineers, of London and Croydon, announce an interim dividend at the rate of 5 per cent. per annum.

WE have received from the Globe-Wernicke Company, Ltd., a copy of their list, No. 7, of office furniture and time and labour-saving appliances, which are so requisite in all up-to-date offices.

THE electric wiring and electric motors for the new Liverpool Cotton Exchange have been entrusted to the Northern Electrical and Ventilating Company, of Stanley Street, Liverpool.

MESSRS. ROBERT BOYLE & SON have issued another of their leaflets, which relates to the natural ventilation of churches, a subject which affects a great many people in town and country.

MESSRS. CLAYTON, SON & Co., of Hunslet, Leeds, have been awarded by the Imperial Continental Gas Association an order for two gasometers, each of a capacity of 2,500,000 cubic feet, for their new works at Hoboken, Antwerp. The value of the contract is 34,000*l*.

MESSRS. GEO. NEWNES, LTD., announce that in order not to detract from the value of their "Technological and Scientific Dictionary," they will issue a fourteenth part instead of completing in thirteen issues as previously announced.

THE Fireproof Company, Ltd., have brought out an ingenious and efficient damp-course of dovetailed steel which is produced in sheets 5 feet long, with 3-inch plain ends for lap-joints. It can be supplied in widths from 4½ inches to 36 inches. When laid in cement it forms an impenetrable barrier to damp.

MESSRS. HEINRICH, WINBY & Co., constructors of tall chimney-stacks and boiler plants, have received an order to construct a shaft and carry out boiler setting work for Messrs. Umney & Peckett. The new work is in connection with the machinery (Messrs. Easton & Bessemer) being installed at Messrs. Watney, Coombe, Reid & Co.'s Mortlake Brewery.

THE Continuous Rail Joint Company of Great Britain, Ltd., have just received orders from the India Office for a large quantity of their patent continuous rail joints (350 tons) for the Indian State railways. The company have also in hand the manufacture of continuous rail joints for the London County Council, Birmingham Corporation, Gosport, and large orders from the contractors, Messrs. J. G. White & Co., Ltd., for use on their extensive railway and tramway work at Para, Bombay, Lacroze and Monte Video.

NEW CATALOGUE.

It could be said to anyone who sought after the works of Messrs. S. W. Francis & Co., Ltd., "Circumspice!" England is a nation of shopkeepers, and shops which are of importance are protected by the steel-revolving shutters, the collapsible and extending gates, the wrought-iron sliding doors and other inventions which come from the great works in the Gray's Inn Road. Their manufactures, however, are not confined to shops. They are used in palaces and mansions of the nobility, in markets, tramcar depots, schools, institutes, stables, and, in fact, in every class of building where a protection that will be at once strong, effective, light and economical is desired. The catalogue will suggest some of the applications, and the testimonials appended to it demonstrate what architects have been thinking of their inventions during half a century. It is well to add that architects' designs are carried out.

WE have been requested to announce that Mr. Arthur G. Cross, F.S.I., has removed his offices to Caxton House, Tothill Street, Westminster, where all communications should be addressed.

DURING the past week there has been the usual daily report of outbreaks of fire. Possibly the worst at the time of writing is that which occurred at Banbridge, co. Down, where the extensive bacon-curing factory of Messrs. Alexander & Bennett was destroyed, with serious damage to two other business establishments adjoining.

BUILDING AND BUILDERS.

It has been decided to rebuild and enlarge the Ramsgate General Hospital and Seamen's Infirmary.

THE Bournemouth Corporation have at last decided on the erection of new municipal buildings at a cost of 100,000*l.*

THE Rochdale Board of Guardians have decided to utilise men from the tramp ward in the construction of a new reservoir.

At the Brentwood (Essex) asylum it has been decided to spend the sum of 12,500*l.* on alterations, principally to the kitchens.

MESSRS. GREENHAIGH & BROCKBANK, architects, of South-end-on-Sea, have been appointed architects by the Rochford Guardians for the enlargement of the present workhouse.

A PRIVATE syndicate contemplate carrying out, with the permission of the Urban Council, extensive improvements at the shore of Leigh-on-Sea, Essex, including the erection of a pier.

IN Oxford Street, Manchester, it is proposed to erect a new hospital for women. Preliminary plans have been prepared by Mr. John Ely, architect, of 32 King Street, West Manchester.

THE baths committee of the Manchester Corporation have instructed the surveyor to prepare specifications and quantities for the immediate erection of baths at Bradford. Sanction has been obtained for a loan of 13,175*l.*

THE Sutton Coldfield education committee have decided that tenders for the erection of a school in Victoria Road should be invited from builders within 12 miles of the site. Some of the members favoured an amendment by which the work would be confined to builders within the borough.

THE Carpenters' Company recently organised an essay competition in reference to the adaptation of land for afforestation. The two prize essays by Mr. Leslie G. Wood, F.S.I., and Mr. Percival T. Maw, P.A.S.I., have now been published in book form for the company by Laughton & Co., Ltd.

SIR ALFRED JONES has acquired Hinderton Hall, and the surrounding estate of 300 acres, which he intends to open for building purposes. The estate will, it is understood, be practically cut up into various lots suitable for the

erection of residences at a rental of 80*l.* to 90*l.* a year, and the locality will be brought within 40 minutes of Liverpool by the establishment of a motor-bus service to Rock Ferry, there connecting with the Mersey railway.

THE Maidstone Urban District Council have decided:—

(1) That the plans committee should be instructed in future to allow a builder to place a 4½-inch wall against an adjoining building where the owners of the respective properties were unable to agree to make the existing wall a party wall, providing such existing wall had been constructed in accordance with the by-laws, and that a circular should be sent to each builder in the borough to this effect; (2) that no alteration to the by-laws should be made with reference to the carrying up of party walls through the roofs of buildings.

THE public works committee of the Cardiff Corporation have unanimously resolved that the borough engineer be asked to prepare a report showing the number of building inspectors employed by the department, the nature of the work, the number of visits to each new building and at what stage such visits were made, particularly as to the mode of inspection and testing of drains and the number of houses inspected by each inspector during the last twelve months.

THE Foundation Company, New York, has been awarded the contract for the foundations for the new Trinity building. When completed this will be the largest office building in the world. The foundations for the entire building will be of solid concrete installed by pneumatic caissons carried down to bed rock an average of 86 feet below the Broadway curb. Under the new portion of the building there will be 89 such caissons, and in the foundations of the section already completed there are 52 caissons, making a total of 141 for the entire building.

A BUILDING is in course of erection near the South Camber at Devonport Dockyard to accommodate large buoys while under examination and repair. The building is the first of its kind erected. Steel and iron only have been used except in the roof, which is slated and wood-lined. The framework consists of steel angle-bars, resting on a cement foundation. To these are secured the corrugated sheets which form the sides, and to still further stiffen the

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

J. & R. CORCKER, Ltd.,

GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.

London Showrooms, Saracen's Head Buildings, Snow Hill, City,

W. B. CLARKE, Agent,
where the "Drawwell" can be seen in action.

walls against wind-pressure additional X-shaped stays are added. The principal dimensions of the building are:—Extreme length, 125 feet; breadth, 50 feet; height to level of roof, 45 feet. The building is traversed by an electric overhead crane.

THE foundation-stones of the South Norwood Congregational church were laid on Wednesday, July 4. The present contract, which embraces the church, accommodating about 635 persons, also the tower up to the belfry stage, together with vestries, cloak-rooms, &c., amounts to 4,090*l.*, and has been let to Messrs. Walter Lawrence & Son, of Waltham Cross. The building is being faced with best sandfaced red bricks, all the dressings being of Bath stone. The design is in Late Gothic, freely treated. The architects are Messrs. George Baines & Son, 5 Clement's Inn, Strand, London, W.C. A large future school is arranged for as part of the scheme.

At a recent meeting of the Cheltenham education committee tenders for the proposed new school in Gloucester Road were considered. Twenty-four had been received, the lowest being that of Mr. Charles Wright, of Leicester, at 12,900*l.*, and the highest, a Malvern firm, at 16,580*l.* A letter was read from the Cheltenham building trades joint committee urging the authority, for the sake of the unemployed carpenters and joiners in the town, to reject the lowest tender in favour of a local one at between 600*l.* and 700*l.* more. This view was supported by one of the members, who moved as an amendment that the matter be referred back to the sites and buildings sub-committee. Eventually Mr. Wright's tender was accepted by sixteen to four.

THE Chief Justice of Cape Colony has delivered judgment in a case brought by the Orange Zicht Estate Company against the Capetown Town Council, questioning the Council's right to prevent the plaintiffs from selling a strip of land in the vicinity of the city springs for building purposes, it being alleged by the Council that the buildings on the land in question would lead to the pollution of the springs. His Lordship thought that the danger of pollution was infinitesimal, and ordered that if the Council did not approve of the plans within a month after submission, the plaintiff company would be at liberty to proceed with the

subdivision of the property in such a manner as if consent had been given. The Council would bear the costs of the action.

THE Glasgow Master Wrights' Association held a special general meeting in the Building Trades Exchange, Mr. David Dick, president, in the chair. It was reported by the secretary (Mr. Ramsay) that, as arranged at the close of the joiners' dispute last year, a conciliation board, consisting of representatives from the operatives and from the Association, had been constituted, and that the working by-laws for next year had now been revised and adjusted by the Board. The principal alterations in the by-laws are a definite delimitation of the Glasgow boundary, a reduction of the working hours in winter, workmen to walk two miles in their own time to the job at which they are employed instead of one as at present, and the signing of the working by-laws to take place at July 1 instead of April 15. The wages are to remain as at present, viz. 9*½*d. per hour.

A DEPUTATION recently waited upon the Sheffield health committee in connection with the Yorkshire and North Midland Cottage Exhibition, and asked that a portion of the Wincobank estate should be set apart for the exhibition which it is proposed to hold in the summer of 1907. A meeting was subsequently held in the Cutlers' Hall, at which there were present representatives of the Architects, Surveyors and Builders' Associations. The conditions of the competition were fully discussed, and the secretary was instructed to forward the resolutions to the health committee for their consideration. The chief idea is that there shall be a competition for the laying-out of the land, and that the exhibition should comprise three classes of cottages, and that the maximum price of the cottages should be 175*l.*, 200*l.* and 225*l.* per house, with not more than twelve houses to the acre.

IT has been at last decided not to remove the St. George's Hospital, but directly funds permit to rebuild on the present site. The cost is estimated at 350,000*l.* When the work is carried out it will be under the supervision of Mr. H. Percy Adams, F.R.I.B.A., 28 Woburn Place, London, W.C.

ELECTRIC NOTES.

AFTER several weeks' consideration of the London County Council Electric Supply Bill the select committee of the House of Commons announced that they had come to the unanimous conclusion, after careful consideration of the evidence, that the preamble had not been proved.

THE representatives of the Institution of Electrical Engineers and kindred societies now touring Great Britain spent Monday and Tuesday in Glasgow. On Monday evening Lord Kelvin was presented, on behalf of the Italian section, with two magnificent portfolios of old drawings of mathematical and mechanical subjects by the great Italian master, Leonardo da Vinci. The presentation was made by Señor Guido Semenza.

THE light railway constructed by the Midland Railway to connect Ashby and intervening townships with Burton-on-Trent was opened on the 2nd inst. The line is 11½ miles in length, 1½ of which is situated within the borough of Burton, the latter having been constructed by the municipal Corporation for the Midland Company's use. It is electrically worked from overhead wires, the power station being situated at Swadlincote, the centre of the system. The cost of construction, inclusive of the purchase of lands, is estimated at 150,000/.

THE York electricity committee have had under consideration the report by Mr. Hutchinson, consulting and mechanical engineer, Hull, in reference to the electricity works, in which he commented upon the undesirability of continuing the use of water from the Foss for the boilers at the works, on account of its excessive amount of scale-forming matter and the consequent liability of the tubes becoming choked up unless it was treated before being pumped into the boilers. The city electrical engineer advised the provision of a water-softening and filtering apparatus to purify the river water. The committee recommend the Council to provide such apparatus at an estimated cost of 300/.

MR. GEORGES MONTEFIORE-LEVI, a native of London, of 35 Rue de la Science, Brussels, formerly a member of the Belgian Senate and president of the Association of Engineers, widely known for his munificent charities, has left his Tournai ceramic ware to the Belgian Government to

form a special collection to be known as the "Madame Hortense Montefiore-Levi" collection in the Museum; also 300,000 francs to the Association of Electrical Engineers of the E.T.M. Institute, to be applied as to one-half for the awarding of a prize every three years for the best original work presented relating to scientific advancement and to progress in the technical application of electricity; and as to the other half, for the creation each year of bursaries of 150 francs each to assist students, and the balance to be applied for travelling scholarships for the Montefiore Institution.

THE American Consul, writing from Roubaix, France, tells of a new invention for firing torpedoes, the work of Jean Denissel, established until recently as an electric engineer at that place. He says:—"Two years ago Dr. Brauly succeeded in utilising electric waves to explode torpedoes and fougades at a distance, also to light incandescent or arc lights and to set electric and steam motors in motion. Armed with the knowledge of Dr. Brauly's discovery, and keeping in mind its disadvantages, Mr. Denissel has succeeded in producing an apparatus for receiving electric waves that is highly sensitive and of great precision, a machine that works underground and in water, at a long distance from the transmitter of electric waves, without mast or post. This machine may be manufactured for about 2/, is easy to transport and not capable of being put out of order. It is a cube and weighs about 7 lbs. Mr. Denissel's discovery rests upon the application of a connector of his own invention. This connector does away with the relay necessary to posts for the reception of wireless telegraphy and tele-mechanism now in use. It is described as of capital importance, as a torpedo may be exploded under any vessel or under a column of men from a distance of several miles."

MESSRS. CLAYTON, SON & CO., LTD., Leeds, have been awarded by the Leeds Corporation waterworks committee the contract for the first portion of the welded-steel aqueduct twelve miles long from Kettlesing Tunnel to the Ure Valley. The amount of the contract is nearly 70,000/. The work will be completed in two years.

CABOT'S INSULATING AND SOUND-DEADENING QUILT

PREVENTS THE TRANSMISSION OF SOUND through walls and floors by absorbing and breaking up the sound waves. No other Deafener does this.

KEEPS OUT HEAT OR COLD exactly as do the feathers of a bird; providing innumerable minute dead-air spaces, giving highest insulating power. Will save enough fuel in a single Winter to pay for itself. Keeps a room warm in Winter, cool in Summer. DECAY, MOTH, AND VERMIN PROOF, AND UNINFLAMMABLE.

Scientific investigation has proved that for HEAT INSULATION or SOUND-DEADENING the highest degree of efficiency, with economy in cost and extreme durability, has been attained by CABOT'S QUILT.

GIBSON & COMPANY,

VARIETIES.

THE Governors of the Brighton Hospital for Women intend to erect a new maternity hospital in Hove, on a site which has been presented to them. The project will cost 10,000*l.*

THE Lewisham Borough Council has under consideration a scheme for erecting workmen's dwellings on $4\frac{1}{2}$ acres of land at Lee. The total estimated capital charge will be 29,130*l.*

FOR the Swadlincote new library competition Mr. Thomas Cooper, of Birmingham, was appointed assessor, and he has given his award, placing Mr. Macpherson, of Derby, first; Messrs. Walton & Thomas, Tamworth, second, and Mr. Cooper, Leicester, third.

THE Lambeth Council have declined to introduce a 30*s.* minimum weekly wage for its employes, on the ground that it would be creating a privileged class of workers, and that hundreds of ratepayers doing similar work earn less than 30*s.* a week.

FOR the convenience of travellers to Belgium by the Harwich route the Great Eastern Railway Company have just placed on the Antwerp express train from Liverpool Street Station dining and breakfast cars in which *table d'hôte* dinner and other refreshments are served on the down journey and *table d'hôte* breakfast on the up journey.

THE Leeds City Council have been informed that it is absolutely necessary to increase the rates 3*d.* in the pound, making them in all 7*s.* 5*d.* During the next five years an increased expenditure caused by sewage and other schemes to the extent of 227,935*l.*, or an additional 45,407*l.* per year, will have to be met.

MONTÉ VIDEO has been selected as the seat of the third Latin-American Medical Congress, which is to meet from January 13 to 20, 1907, under the auspices of the Government of the Republic. In connection with the Congress there will be a hygienic exhibition, and manufacturers of apparatus of hygienic application are invited to exhibit and compete.

ST. ANNES Urban Council approved on Monday plans for the new King Edward VII. college, which is to be erected on a site of 32 acres by the Governors of Lytham

Charity. The cost is 22,000*l.*, and the building will mean a further expenditure of 30,000*l.* The building is planned with a view to future extensions, and will provide accommodation for 240 day boys and 30 boarders.

THE Mersey and Irwell joint committee have decided that unless a scheme is adopted before July 30 legal proceedings will be taken against the Gorton Urban District Council. It was also decided to take a similar course with regard to the George Street works of the Prestwich Urban District Council.

THE Council of the Institution of Mechanical Engineers have appointed their president, Mr. Edward P. Martin, as one of the representatives of that Institution upon the main committee of the Engineering Standards Committee, in place of Mr. E. Windsor Richards, past president of the Institution of Mechanical Engineers, who has retired.

AN inquiry has been held on behalf of the Local Government Board into an application by the Coventry Corporation for permission to borrow the sum of 13,973*l.* for the purpose of works of street improvement and surface-water drainage. The town clerk, referring to the application for 11,744*l.*, said the proposal was one to supplement what the Council had already done in paving footpaths with concrete slabs.

THE solicitors to Mr. W. Horton, of Colwyn Bay, have taken up the award of Mr. Wood in the arbitration between Mr. Horton and the Colwyn Bay Council. The umpire has awarded 800*l.* to Mr. Horton for easement and damages for the pipe line laid through his estate at Rhos-on-Sea, and 700*l.* for consequential damages to his estate by reason of the outfall being near it, provided he be legally entitled to such damages in respect of consequential damage. Mr. Horton claimed 8,000*l.*

A CENTRAL conference of the Engineering Employers' Federation and the Amalgamated Society of Engineers is to be held for the purpose of considering amendments to the terms of settlement adopted after the great strike of 1897. There are three suggested amendments. One is that the Federation shall recommend the preferential employment of society men. Another seeks to limit the number of apprentices, and a third asks that the maximum overtime shall be twenty hours per man per month, instead of forty hours, as at present.

A PUBLIC meeting was held at Manchester when it was decided to establish a co-partnership, under the title "Manchester Tenants, Ltd.," to be registered under the Industrial and Provident Acts. The capital will be issued in 100 shares, and tenants must possess five shares, paid in instalments. Five per cent interest out of profits will be paid, and on the first 100 shares an extra 2½ per cent is to be paid. The basis of the rents will be 6½ per cent on the cost.

THE cleaning and lighting committee of Edinburgh Town Council on Monday approved of a recommendation by a sub-committee that the remaining flat-flame gas lamps should be replaced with 2½ cubic feet inverted incandescent lamps, which should also be substituted for other incandescent lamps in the city. It is expected that the conversion, when carried through, will effect a saving of from 1,100*l.* to 1,200*l.* per annum. It was also agreed to recommend that 16 of the 120 electric lamps authorised by the Town Council should be erected at Portobello, continuing the present line to Joppa.

ACCORDING to the *South Wales Daily News* of the 29th ult. it was announced on the Iron Exchange, Birmingham, on the previous day, "that agents of American firms are negotiating for the supplies of immense quantities of structural steel in the English markets, and that contracts have been effected with one leading Yorkshire house for 6,000 tons for prompt shipment. In some cases the Americans have been offering to take the whole product of certain firms for three and six months. The activity in the English steel trade is, however, preventing the offers being accepted, as manufacturers are looking forward to more remunerative prices in the ensuing quarter."

ON Sunday evening, as the result of an inspection owing to a fall of some of the brickwork lining the roof of the Box tunnel (two miles long), on the Great Western Railway near Bath, about three-quarters of a mile from the Box end, Mr. Baughan, the permanent way inspector, ordered the immediate closing of the tunnel to all traffic. There is 300 feet of earth or rock above the roof, and falls of earth had already taken place intermittently. Twenty minutes after the inspector had ordered the tunnel to be closed 600

tons of material fell from the roof, covering both lines. It brought down the electric wires specially provided to give alarm in such cases. These rang in the cabins at each end of the tunnel. The position is serious. It is estimated that it will take two or three days to clear the debris.

A LABOUR member (Mr. John Ward) asked the Home Secretary last week in the House of Commons whether his attention had been called to the generally low standard of sanitation prevailing, and the complete want of proper shelters for workmen in cement factories throughout the country; whether he had power under the Factory Acts to cause such factories to be properly inspected, and, if not, whether he proposed to introduce legislation dealing with the subject. Mr. Gladstone (Home Secretary), in reply, said:—"I am not aware that the standard of sanitation in cement works generally is low. Cement works are, of course, dusty, and the maintenance of cleanliness is not easy. I will call for special reports on the subject. As regards inspection, the inspectors have the same power under the Factory Acts in regard to cement works as they have in regard to other classes of factories and workshops. I have no reason to suppose that these are insufficient in the case of cement works."

THE British Association of Waterworks Engineers will hold their annual meeting at Scarborough on Thursday, Friday and Saturday, July 12, 13 and 14, under the presidency of Mr. William Millhouse, Assoc.M.Inst.C.E., water engineer to the Corporation. The following papers have been offered for reading and discussion:—(1) "The Geology of North-East Yorkshire in Relation to the Water Supply of the District," by C. Fox-Strangways, F.G.S.; (2) "Rural Water Supplies," by J. Mitchell Wilson, M.D., county medical officer, East Yorkshire; (3) "Water Supply in a Dairy District," by William Phelps. Note.—Papers Nos. 2 and 3 will be discussed together. (4) "The Parsons Turbine," by F. G. Holden, B.A., Assoc.M.Inst.C.E., resident electrical engineer, Scarborough; (5) "Various Causes of Waste of Water, and Methods of Prevention," by Ralph Blakiston; (6) "Tropical Waters and their Purification," by H. G. Foster-Barham, Assoc.M.Inst.C.E., F.G.S.; (7) "The Laying of a Submerged Water Main under the River Ouse," by W. H. Humphreys, water engineer, York.

WORKING GRANITE.

A CONFERENCE has been held in Aberdeen between the monumental branch of the United Operative Masons and Granite Cutters' Union and the Aberdeen Granite Association on the subjects of the removal of surface machines outside the sheds, the blowing of dust with air-pipes, and the general question of shed accommodation. The representatives of the branch, in the course of their statement, explained that the whole three topics all centred round the general point of the prohibition of dust; that three-fourths of the mortality in the branch was due to lung trouble, and that the mortality in the monumental branch from this cause was higher than the mortality in the building branch. The representatives of the Association undertook to advise the directors to make a recommendation on the subject of the removal of the surface-cutter, where practicable, outside the sheds, and to suggest to the directors that a positive prohibition should be issued in regard to blowing dust with air-pipes. As to the shed question, the representatives of the Association stated that it was difficult even in normal times to suggest a standard of accommodation per man which would apply in all classes of work, but it was recognised that it was not profitable for an employer not to give his men sufficient room in which to work freely. The representatives of the branch accepted the general assurance as to the last point.

THE UNION JACK CLUB.

A GRAND evening concert in aid of the building funds of the above club, under the patronage of Her Gracious Majesty the Queen, will be given at the Queen's Hall, Langham Place, on Wednesday, July 11, at 8.30. A splendid list of artistes has been engaged, including Miss Janotha (court pianist to H.I.M. the German Emperor), assisted by the band of the Royal Engineers. A concert of this class is bound to be a success, and those who desire to obtain tickets should take the precaution of making early application.

THE LABOUR PROBLEM.*

MUCH has been said of late about the unemployed, and although the reasons for lack of employment do not come directly under our notice as an Institution, yet the question of labour is one that concerns each one of us.

When estimating the cost of an installation, two problems confront the heating engineer:—(1) The cost of the material; (2) the cost of the labour fixing the material. It is not difficult to ascertain the former, but the same cannot be said of the latter. The practice with some is to add a percentage of the cost of the material for the labour, and with others to work out the cost of the labour separately for each item. I believe in the latter, because the results obtained are more accurate than if the former method was adopted, and at the same time the actual labour on the job may be checked with the estimate. If the labour on a job is costing more than it should, the time to find it out is whilst the work is in progress, and by having the cost of the labour of the preceding week accurately made up by the following Monday or Tuesday and carefully checking it against the amount included in the estimate, item by item, a very close watch can be kept on the men's work.

There are probably few here that have not at some time or other been astounded at the results of tenders for general engineering work, when all the competitors have to quote on the same basis. A complete set of plans and a hard-and-fast specification are furnished to each competitor, and yet when the result is announced the lowest price is often 30 per cent. or 40 per cent. less than the highest price, and in some cases is less than the actual prime cost of the work. There is something radically wrong in this state of things, which can only be due to one or both of the following reasons:—(1) Under-estimation. (2) The ideas of a fair profit must vary considerably among the competitors. I will deal with the latter first.

Any contractor, no matter what line of business he may pursue, is justly entitled to a fair profit on any work he may

execute, and I venture to say that there is no client so unreasonable as to be unwilling to pay a fair profit. Any one who willingly gives a cost-price quotation for any work inflicts a gross injustice on himself as well as on the other competitors, who are put to considerable expense in preparing the estimate. The plea of advertisement does not justify such an action; as price nowadays governs practically every contract, and I fail to see what is gained by doing work at cost price. In my opinion it is the duty of each one of us to quote for good honest work, and at the same time include a fair profit on the transaction.

Now for the first reason, viz. under-estimation. If this occurs the mistake will probably be found in the labour side of the estimate, and the question then arises, Has the amount included for labour been put too low, or does the actual labour on the work cost more than it should do? If the figure has been put too low, the remedy is not far to seek; if, however, the loss incurred is due to time wasted by the men, the remedy is not so easily found, and we are at once confronted with the question, How are we to obtain fair value for the wages we pay our workmen? As a matter of course, we all employ the most competent men we can find, and when commencing a job furnish the leading hand with every particular, keep him well supplied with material, and last, but by no means least, good tools. Bad tools waste more money than their own worth in a few days. Assuming, then, that our fitters have every facility placed at their disposal for erecting the work, how is it that some installations are completed far more quickly and better than others of an exactly similar character? There are many men who year in and year out work honestly and to the best of their ability. Trust placed in them is not abused, and it is a pleasure to set them to work, knowing that time and material will not be wasted and the work will be well done. Such men are a credit to themselves and reflect credit on their employers.

Unfortunately, all men are not of this stamp. Some have very good intentions, but are extremely careless. Overcaulking a joint can be attributed to nothing else than carelessness. How a man can blissfully ram six yarns into a 2-inch caulked joint is a mystery to me. Waste, rubbish and, in one case to my knowledge, a scaffold pole are left inside pipes, and when the time comes for testing

considerable expense is often incurred before the stoppage is traced and put right. How are such men to be dealt with?

To charge them with the cost of their carelessness is out of the question, and anything in the nature of gentle advice is not often effective. Drink, I believe, is responsible for more trouble with workmen than anything else. Personally, I am a teetotaler, and would like to see everybody else of a similar disposition. The temptation to men who are partial to drink must be very great when they are away on country jobs. However small the village in which they are quartered there is invariably a very convenient public-house to which frequent adjournments are made, with the inevitable results which, unfortunately, are only too familiar. Insults to clients, architects and clerk of works, waste of time and bad work, damage to decorations in the building, with a sequel in the form of a bill from the general contractor for redecoration.

Not long since my firm sent a fitter whom we considered trustworthy, and who had been in our employ for several years, to explain the working of an apparatus he had just erected to the stoker who had been appointed. Before going to the place he went into a public-house and had sufficient liquor to make him light-headed. On reaching the boiler-house he explained to the stoker with an air of bravado that he would show him how to get the apparatus hot quickly. He filled the boiler with wood and very soon had a roaring fire going, on to which he kept piling more wood until the apparatus began to boil. One of the occupants of the building sent down word that the pipes near him were making a noise. Immediately the man raked the fire out on to the floor, and as the boiler-room was at the bottom of a staircase, smoke ascended and began pouring out of a window. A passer-by seeing this immediately pulled the fire-alarm, and in a very few minutes fire-engines and escapes were on the scene, whilst the man was in the boiler-room gloating over the heap of smouldering embers. The humour of this incident was not apparent until we had pacified our clients.

We relieved ourselves of that man's services, and shortly after he was engaged by another well-known firm of heating engineers in London, who sent him to work at a school which was building near my home, and I saw him one morning

going to work about 9.30 and stopping at the public-house nearest the station on his way to the school. There is a man working for my firm now who is an excellent fitter, but he will occasionally drink in working hours. I have repeatedly warned him and had friendly chats with him about it, and he always admits the truth of my remarks, but he still continues the habit. I believe there are only two alternatives for such a man—either get him to sign the pledge or dismiss him. We do not wish to dismiss him as he is a good man, and good men are scarce, and he has a large family entirely dependent upon him.

Wilful deceit is a strong accusation to bring against any man, but not too strong for men who charge for time during which they have not worked. We were recently struck by the unfailing punctuality of our men according to the time sheets sent in by them. We happened to find out that in one or two cases the men did not arrive at the time stated, so we sent to all our jobs in London and found that several other men were overcharging their time. It does not take much calculation to see that if 150 or 200 men overcharge six or seven hours a week the employer is very soon hundreds of pounds out of pocket. I think that a lesson in the police court for obtaining money under false pretences would not be out of place for such men and would have a very wholesome effect in the future. It is not easy to rise every morning at five o'clock and journey across London in order to get to a job in time, and if a man is sometimes late no complaint need be made, but to charge for such time is little short of theft. We are compelled to trust our men to a very large extent, and in my opinion it is a very miserable business for any man to go to a job like a detective to see if the men are at their work.

Then there are some men who feel it their bounden duty to talk whenever the client or architect arrives at the job. We recently received a message from one of our jobs where there is a hot-water supply boiler which is regularly cleaned twice a year, that they could not get hot water. The man who usually did the work at this building was out of London at the time, so another man was sent. The first thing he did was to look at the boiler and say that "it had not been cleaned for twelve years" (those are his exact words), and as our clients had only just paid for the cleaning they naturally wished to ask a few questions.

The foregoing are a few of the experiences with which we are all familiar, and the problem is how to deal with them. The men are human beings and should be treated as such. Some of them are often away from their homes for months on end living amongst strangers, which is not a desirable state of things from the fitter's point of view. They also may not see things in the same light as we do.

We recently had a man working at a country house in one of the most beautiful spots in Kent, a perfect place in my opinion. When I went down there he told me that it was the most awful place he had ever been in. There were no music-halls, and as soon as he had finished his work he had nothing to do but go to bed.

The old saying is that you can get anything done for love or money. I suppose the ideal way of securing the esteem and co-operation of our men would be by a judicious combination of the two. Unfortunately, so many men quite misunderstand any attempt at kindly or considerate treatment, and classifying it as weakness on the part of the employer, immediately take advantage of it. We must therefore look to the money side of the cure.

The promise of a bonus at the end of the work is a move in the right direction. My firm have recently gone a step further. When a job is starting the leading hand is told the exact amount of time included in the estimate for labour. If he can save on that time he receives a bonus in proportion to the time saved. This certainly does stimulate the men in their efforts to get the work done quickly, but does not deal fully with the problem, as only the leading hand receives any benefit. Perhaps some of you have some successful system of dealing with your men and would not mind passing it on to us.

There is another matter to which I would like to refer and which I commend to the manufacturers for their consideration. Often when testing a job flaws and holes are found in the material, and by the time the apparatus has been emptied and refilled and the defects righted, several pounds are spent, which on small jobs plays havoc with the man's bonus. It is very small comfort to receive a letter from the manufacturer enclosing a credit note for a few shillings, with the remark that everything was thoroughly tested before leaving the foundry. Thus the contractor has to pay for defects for which he is not responsible.

COOLEY'S PATENT

DOUBLE DOWEL-PINS.

By this system each Block is securely fastened
to its neighbour, and by means of the double-grip of
each Pin it is absolutely impossible for the Blocks
to loosen; hence it can be recommended in all
places where the traffic is heavy, such as in Factories,
Schools, Public Halls and Sheds, &c.

For **Wood-Paving** purposes this system will con-
siderably increase the life of the road by reason of
the formation of a solid mass, which counteracts
the destroying effects of vibration.

GOOD ADVICE.

Architects, Contractors, and others are recommended to journey by the

GREAT CENTRAL RAILWAY.

They will find it

RAPID TRAVEL IN LUXURY.

Each Express is VESTIBULED and has a BUFFET CAR attached available for FIRST and THIRD-CLASS PASSENGERS.

The London Express Trains centre on Sheffield, branching therefrom westward to Manchester, Oldham, Stalybridge, Stockport, Warrington and Liverpool; northward to Huddersfield, Halifax, Bradford, Leeds and York; eastward to Doncaster, Grimsby, Hull and North Lincolnshire.

Cross Country Expresses and Through Arrangements with other Companies are a distinct feature of the Great Central services. Liverpool, Manchester, and Sheffield are linked up by corridor trains with Lincoln, Harwich, Lowestoft, Norwich, and the Great Eastern system.

Newcastle, Sunderland, Durham, York, Bradford, Huddersfield, Rotherham and Sheffield are provided with through trains via Nottingham, Leicester, Banbury and Oxford, to and from Southampton, Bournemouth and the South-Western Line.

Bath, Bristol, Exeter, Torquay, Kingswear, Plymouth, and the Cornish Riviera are reached by Express Trains from Leeds, Wakefield, Halifax, Huddersfield, Sheffield, Nottingham, and Leicester.

TICKETS are issued in advance at all offices, or by Messrs. Dean & Dawson, the Company's Agents, who also book to the Continent by any Channel service in connection with the Rundreise or Tourist system, which affords travellers choice of route and a reduction of about 30 per cent. of ordinary fares.

VELURE

WHAT WE SAY

VELURE is a perfected JAPAN PAINT, super-
ceding varnish, with remarkable spreading,
elastic, and weather-resisting properties. One
coat equals two of paint and one of varnish, and
wears twice as long. 120 colours. Any shade
matched. Sanitary, washable.
Will not crack, chip, peel, blister, or fade.
SAVES TIME, LABOUR, VARNISH, AND MONEY.

WORTH

ONE GALLON
WILL COVER ABOUT
90 SQUARE YARDS

TRYING

WHAT CUSTOMERS SAY

ONE OR MORE FRESH LETTERS WILL APPEAR EACH TIME.

The Best for Carriages.

Two years ago I painted a phaeton with it a dark
green. It has been exposed to all weathers ever
since, and is as fresh to-day as when it was put
on. It is the best paint I have ever used.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further

answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

. As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITION OPEN.

DOLGELLEY.—July 14.—The Dolgelley Urban District Council invite the terms of engineers for preparation of a scheme for sewage disposal, &c. The fee for each heading must be stated separately, and must include for all out-of-pocket expenses incurred in visiting the district, and otherwise in connection with the preparation of the scheme and the carrying-out of the works. The Council do not bind themselves to accept any of the terms offered. Mr. Richard Barnett, clerk, Queen's Square, Dolgelley.

"The Taming of the Shrew" still continues what must be a most successful run at the Adelphi theatre. Miss Lily Brayton interprets the very difficult character of Katharina in a thoroughly efficient manner, and Mr. Oscar Asche's portrayal of Petruchio is a particularly fine piece of acting. The minor parts, as is seldom the case, have each been entrusted to artists, Messrs. G. Kay Souper, R. F. Anson and Henry Kitts, as Biondello, Grumio and a Pedant respectively, being specially worthy of notice. Let those who cry out on the decadence of Shakespeare look in at the Adelphi, even during the present tropical weather, observe the numbers of the audience and hold their peace.

lock it from the inside if privacy is sought. The roof is the most conspicuous feature, for it is formed in six separate pieces which can be made to move independently. In consequence it is possible to have either all the roof open to the sun, three-quarters, half and so on. All the gearing for altering the roof is placed under the floor where there is no chance of it getting out of order. The manufacturers are G. A. Williams & Co. Many visitors will find the exhibits of Mr. P. E. Gane a relief from the surrounding stands. It is a pleasing scheme for the decoration and furnishing of the dining-room and library of a modern house. Both are reposeful, and show thought for the attainment of a picturesque effect.

Rowe Bros. & Co., Ltd., in addition to showing a remarkably large supply of closets, cisterns, sinks, &c., exhibit their own manufactures in the shape of a striking collection of sections of lead pipes varying from 6 inches to $\frac{1}{8}$ th inch, as well as other useful products of lead, including special pipes and gutters, sash weights, &c. A bronze medal was awarded to their lead pipes. Their City Lead Works, Canons Marsh, Bristol, were rebuilt in 1903, and contain show-rooms which must prove a boon to the building trade in the West of England. They are on a most extensive scale, and contain stores sufficient to supply immediately all ordinary requirements. Rowe Bros. & Co., Ltd., have, moreover, extensive works in Birmingham and Liverpool. Several ranges come from the Eagle Range and Gas Stove Co., Ltd. The Eagle "Governor" grate, with their doors, may there be seen. If a fire is required to burn up very quickly the entire front is closed. The reverse of this is obtainable from the same stove by the slow combustion arrangements, which permits of a fire to be left alone for fourteen hours. The London Warming and Ventilator Co., Ltd., show the "Florence" patent warm air and ventilating grate in action, as well as several stoves, gas fires, &c. The Maughan Patent Geyser Co., Ltd., boldly assert that their "New Teba" geyser is the most perfect geyser made, for it embodies the experience of thirty years' manufacture of these contrivances. Its most essential feature is the patent safety-valve, or interlocking gas and water-taps, which prevent all accidents. Water must flow through the copper chambers before the gas jets will become lighted, thereby removing the risk of an explosion.

The "Simplice" geysers are on a somewhat different principle, for the water falls like a spray in the interior. The "Multi-supply" geyser, as its name suggests, is intended to provide hot water to several rooms, and renders a house altogether independent of the kitchen fire. Hot water is turned to quite another purpose by Prior's patent heat distributor. The idea is a most simple one, and should be carefully inspected at the stall of Mr. J. Damrel Prior in the east hall. At the back of a sitting-room grate a four or five copper tube distributor is inserted. The tubes are connected at the top by a gun-metal collector, out of which a flow-pipe conveys the water up the chimney or other convenient position to radiators or hot-water pipes

in adjoining or overhead rooms. The water is then returned to the reservoir at the bottom of the distributor. The hot water is controlled by a tap, and may be kept out or admitted into a room at will. One fire

will, therefore, warm four rooms at the expenditure that is usually incurred for a single fire. The radiators may be fitted up with a combination towel rail, radiator and clothes airer. Mr. Prior has also invented improvements for the ordinary grate. His "Venetian" fire grate has an adjustable

canopy at the top and draught-doors at the bottom and three Venetian bars, which, both conjointly and independently, make a fire completely controllable. The three Venetian front bars are like the laths of an ordinary Venetian blind.

medals have been awarded to them. The "Mural" closet, which won one of them, is fixed to iron wall-brackets

by nuts and screws, consequently if the pedestal has to be renewed or changed it can be done without touching the

For a very slow fire, such as an all-night one, all the bars are closed; for a moderate the top one is open, while for a fast fire all the Venetian bars and also the draught-door are open. The entire front swings open for cleaning purposes. For both the combined grate with the heating apparatus and the Venetian grate Mr. Prior has received bronze medals. The grate is also a preventive of smoky chimneys. The Iron and Marble Co., Ltd., have selected various makes of grates, ranges, registers and other necessities for house-building. They received an award for the "Drawell" register grate. The "Geyser" range should receive attention. James Stott & Co. are represented by several patent roof ventilators, fans, &c. The British Fuel Economiser and Smoke Preventer Company show a section of a boiler furnace with a "Bunsen bridge," which effects the prevention of smoke and a saving of fuel.

George Howson & Sons, Ltd., have their sanitary works at Hanley. The numerous objects in vitreous fireclay are for their own sake deserving of inspection. Two bronze

wall surface. It is fitted with an improved detachable seat and a "Rivo" cistern. The other medal was awarded for the colonial urinal, which is conspicuous for its glaze and cheapness in price. We show, in our illustration, their surgeon's lavatory, intended for operating rooms. It is fitted with a lever apparatus to turn on the taps. Below the basin is another lever which on a slight pressure opens the waste pipe. Some of the merit for the boasted advance in surgery should be accorded to firms like Messrs. Howson, who do much to render the surgeon's work successful. Messrs. Howson cater largely for public and private institutions. For example, their Asylum Safety Bath fitting has regulating valves and cam action, which render it impossible for a careless or even a malicious attendant to allow too much hot water to enter the bath and scald the user. A turn of the handle will let on the cold water, a further turn admits the hot, and the two then combine and make a temperate bath. This fitting, together with their automatic drop by drop flushing cisterns, have

been deferred by the judges for further consideration before an award is announced. There are other specialties intended for hospital work.

Doulton & Co.'s collection is always sought by visitors. They have fitted up two bath-rooms in a charming manner, and introduced many of the luxuries and necessities seen in this important part of every well-equipped house. On the same stand are their closets, urinals and lavatories, an oval operating lavatory with knee-operated mixing valve (which received a bronze medal), a sink for operating-rooms, an operating lavatory, a non-concussive water mixing valve (awarded a similar medal), and a mortuary slab. In the corridor are three glazed fireclay stoves and fireplaces which received a bronze medal from the Sanitary Institute. Shanks & Co., Ltd., show, amongst many other things, three or four baths. Those fitted with showers are pleasantly suggestive of coolness. In addition there are urinals, closets, &c. On another stand are a selection of marble-top lavatories.

A drain testing plug that has many recommendations (proof of this is seen in the bronze medal awarded to it) is shown by Mr. D. Smith, the inventor, of Sheffield. It can expand from $3\frac{1}{2}$ inches to $6\frac{3}{4}$ inches diameter. Mr. Smith also makes a gradient rule and level shown by the company of that name. The self-acting disinfectant machine is fixed on the top of a closet system. It discharges automatically a spray of the pine, carbolic or other disinfectant into the cistern water as it runs down for flushing purposes. The cost of the original machine and of its upkeep is insignificant, but its possibilities as a germ exterminator are remarkable. Last year, and again this year, the Sanitary Institute awarded a medal to the steel portable cloak-room fitting made by the "England Works." It accommodates hats, coats, umbrellas, &c. For large institutions it can be supplied in ranges up to 100 feet long. J. Duckett & Son, Ltd., have a big exhibit of glazed ware sanitary fittings. The judges have marked out for distinction a new radial trapped outlet for wash-down w.c.'s, Debney's patent. The jointed outlet can be turned three-quarters of a circle, so as to make an easy connection with drain or soil pipes in any position. The advantages are easily comprehended. Hines's locking bricks for bacteria beds, &c., obtained a bronze medal. The bricks can be

built in the ordinary way, closely together or pigeon-holed, leaving $2\frac{1}{2}$ -inch or $4\frac{1}{2}$ -inch openings. The makers claim that the new system effects a saving of 33 per cent. Enthusiasts for hygiene will be greatly interested in the idea patented by Vento, Ltd. This is an attachment fitted to w.c.s which makes an odourless water closet. An air vent is made in the pan which communicates with the outer air by means of a metal tube passing an electric fan fitted in a box. The fan may be set in motion as soon as the w.c. door is closed either by a switch or an automatic patent door bolt. The Plastoment Asbestos Flooring Co. have laid down a piece of their jointless flooring.

Our brief *résumé* of the exhibition will show it contains much to interest and instruct a large number of people during the fortnight in which it is to remain open. There are numerous novelties shown for the first time.

A new school is to be erected at Chalkwell Park, for the Southend-on-Sea education committee.

MR. CARNEGIE has increased his offer of 5,000*l.* to 15,000*l.* for the Northampton Library. Work will be immediately commenced.

ON Thursday, July 12, the British Association of Waterworks Engineers commenced their three days' conference at Scarborough.

THE Shoebury Urban Council have decided to erect a new gasholder, and that estimates be obtained, to contain 60,000, 100,000 and 120,000 cubic feet.

AT Preston Quarter Sessions on the 5th inst., eight magistrates, four barristers, six experts from various towns and others were engaged for five hours in an appeal regarding a drain which can be put right for 3*l.* The appellant was Mr. Hall, agent for Lord Derby, and the respondents the Preston Corporation. Appellant asked that a conviction at the police court regarding an alleged non-abatement of nuisance be quashed. Ultimately this was done, and the case was settled, the terms being that each party should pay its own costs and the appellant to purchase a new grease trap which the Corporation shall affix.

WILLIAM GREEN & CO. (Ecclesfield), Ltd., ECCLESFIELD, near SHEFFIELD.

ARGYLL COMPANY'S MOTOR WORKS.

ONE of the most hopeful signs for the future of British manufactures is the application of architecture to works and factories. Anyone who studied the kind of buildings which were formerly erected in English and Scottish towns would from their flimsy character realise that the owners were indifferent about the future. Their main ambition was to make a fortune as quickly as possible and then to retire, having the expectation that they would ascend to a different stratum of society. The State did not care about architecture or construction. But at last it realised the danger of defective buildings to the people employed in them. The numerous Factory Acts are a commentary on a class of work that does not deserve to be called building. Since the passing of Limited Liability Acts a great change has been recognised. A successful business has acquired a longer term of existence than was heretofore possible. It is therefore worth having a building which will endure. Moreover, it is becoming realised that it is more economical to begin with a suitable plan with everything required in its proper place than to be subjected to prosecutions for breaches of the Factory Act, and in consequence to become notorious rather than respected.

The new buildings of the Alexandria works in the Vale of Leven, about twenty miles from Glasgow, can be taken as a remarkable exemplification of the spirit of enterprise which is beginning to prevail. Works and offices which have cost nearly 150,000*l.*, exclusive of machinery, have been carried out from the designs of Mr. Charles J. Halley and Mr. Hamilton Neil. The works were formally opened by Lord Montagu of Beaulieu on June 26.

The new works are the largest of their class in the world. The buildings have a frontage to Luss Road of 760 feet. The office block occupies 550 feet, the machine shop 150 feet, the lodge 34 feet and the chassis shop 26 feet. The base of the central part of the office block is of Aberdeen granite. The entrance-hall has a floorage of 245 square feet. The gallery and stair balusters are of Derbyshire alabaster with a broad hand-rail of Pavonazzo. White Sicilian marble is used for the floor and steps. A gallery, which is carried round the upper part of the hall, is intended for a promenade, and has a floor laid with terrazzo. A corridor, 425 feet in length, extends along the centre of the building. On one side of this passage is the administrative department of the works. In the treatment of these rooms walnut, mahogany and oak have been used for the wall panelling. A sub-corridor provides means of communication between the office block and the works. The portion of the buildings on the other side of the long corridor is set apart for recreation purposes. There are dining-rooms for staff and managers. The entire length of the ground-floor of the block will be used as stores. The contract for the administrative block was carried out by Messrs. P. & W. Anderson, who worked all the stones in Glasgow. They used 93,920 cubic feet of red sandstone, 5,320 cubic feet of Peterhead polished granite, 602,500 common bricks, 411,520 enamelled bricks, 1,240 tons of Portland cement.

VIEW OF WORKS.

The size of the workshops can be judged from the roofing, which was carried out by Messrs. Donald Clerk & Son, Ltd., Glasgow. Machine shop, 416 feet by 360 feet, is covered with steel north light roof couples of 30 and 33 feet spans; the roof couples are constructed so that in addition to

the roof load, the tie-rod carries all the counter-shafting and also runways for transporting jobs to the different departments. Chassis shop, 340 feet by 80 feet, is covered by two spans of forty king-rod trusses; in this shop provision is made for two 10-ton electric travelling cranes to run on steel girders supported by steel columns. Coach-building shop, 422 feet by 100 feet, divided into two spans of 50 feet each. Painting and lining shop, 422 feet by 65 feet, divided into two spans of 32 feet 6 inches each. Power-house and smithy, 300 feet by 75 feet, divided into two spans of 37 feet 6 inches.

All the roofs are covered with Messrs. Ferguson, Allen & Co.'s concrete steel, which gives a maximum strength for a minimum weight. The concrete is waterproofed by two layers of rock asphalt, so that with the exception of the glazing the roofs are practically inde-

BENCH SHOP.

structible. All the buildings are provided with steel-framed gables covered with corrugated sheets to provide for future extension.

The motive-power at the works consists entirely of gas-engines, constructed and supplied by Messrs. A. Rodger & Co., Govan, Glasgow, under Professor Rowden's patents, and using producer gas from the gas plant manufactured

MACHINE SHOP

and installed by the same firm. There are at present ten of these Rodger-Rowden gas-engines, each capable of developing 100 b.h.p., and orders have been placed for three additional engines of the same make, with a corresponding increase in the gas plant. The driving of the works is partly direct by means of belts and partly by electric transmission, the case of each department being considered on

direct to a Crompton's continuous current dynamo, working at a pressure of 200 volts. These gas-driven generators are arranged to work in parallel, and the subdivision of power into units of 100 b.h.p. has proved a most economical feature.

The small space occupied by these engines is also a feature of much value in works crowded with machinery

VIEW OF GAS-ENGINE SUPPLIED BY A. RODGER & CO.

its merits, and the most suitable and economical method adopted.

The electric energy for the various electric motors for machine driving, ventilation, cranes, &c., as well as for lighting, is generated in the power station—a building 120 feet long by 32 feet wide, with walls of white-glazed brick and tiled floor, in which there are at present seven Rodger-Rowden gas-engines of 100 b.h.p., each coupled

as those of the Argyll Motors, Ltd., are. The degree of economy which is attained by these engines will be appreciated when it is stated that with coal costing 15s. per ton delivered at the producers, 12 b.h.p. is developed at the crank-shaft of the engine for 1d. per hour. This result far surpasses that attainable by any other method of power generation, and the subdivision into units not only reduces the risk of complete stoppage owing

British Goods for San Francisco.

TRADE

MARK.

WALTER MACFARLANE & CO.,
Saracen Foundry,
Possil Park,
GLASGOW, SCOTLAND.

Telegraphic Address,
"SARACEN, GLASGOW."

Give immediate shipment from their extensive stocks of such lines as—

SOIL and DRAIN PIPES (either Coated or Glass Enamelled), **RAIN WATER PIPES** and **GUTTERS**, **ELECTRIC LIGHT PILLARS**, **CARRIERS**, **WIREWAYS**, &c., while their vast range of **COLUMNS**, **FRIEZES**, **SPAN-DRILS**, &c., for use in **CONSTRUCTIONAL WORK**—always ready for instant operation on receipt of detailed plans and specifications—is a guarantee for earliest shipment of any work entrusted to them.

to any accident, but it also insures that the maximum economy is attainable at all loads from the maximum downwards.

The complete absence of smoke from the power-generating plant is also a point of great importance in these days of sanitary reform. The buildings are also fireproof. The general contractors were Messrs. Ferguson, Allen & Co., of Glasgow, to whose energy, care and organising power Mr. A. Govan, the managing director, has paid an eloquent tribute. About the middle of April 1906 their tender was accepted, and operations were immediately commenced on the machine shop and gas plant. On June 26 the first gas-engine was put in motion, and afterwards ran for some days. Therefore in a little over two months the Argyll Company were able to get machinery and shafting into position for working. The various shops are in most respects of similar construction. All roof trusses are of steel, bound together with T-bar purlins, covered with reinforced concrete 3 inches thick, which is also covered with asphalt ½-inch thick, the whole being supported by — section steel columns and channel beams suitable for attaching shafting, hangers, &c. The tie-bars of roof trusses are also specially strong to receive any countershafting of machinery below. The walls are all of brick (enamelled inside and terra-cotta pressed outside), excepting front wall, machine shop and south gable of chassis shop, which are built of Dumfries stone outside and lined with enamelled bricks inside. The floors are of concrete covered with 1 inch of asphalt, excepting coach-building shop, which is finished with maple. Where buildings are two storeys high the upper floors are thoroughly fireproofed with reinforced concrete, and finished in the usual way with asphalt. Lavatories are provided for the workmen in each shop, thereby making each department a works in itself complete in every detail. The shops are all well ventilated and lighted in the walls by iron casements and in roofs by Heywood's patent system. The various buildings are separated by good broad roadways formed of concrete and finished with asphalt 1½ inch thick. Below these roadways are laid the company's supply pipes and drains, the former being accessible through chases in roadways and the latter being all collected at a large septic tank before finally discharging into Council sewers.

The quantities of materials used up to May 26, 1906, are calculated to be as follows:—Steelwork, 2,200 tons; cement (Robson's, of Hull), 3,000 tons; concrete, 15,000 tons; stone, 3,000 tons; rubble for bottoming, about 5,000 tons; enamelled bricks, 1,000,000, about 5,000 tons; pressed facing terra-cotta bricks, 750,000, about 3,000 tons; common bricks, 1,800,000, about 6,750 tons; asphalt on roofs and floors, 3,500 tons; glass area, 170,000 superficial feet.

The works are complete under the following departments, the areas of which are also given:—Machine-shop, tool-room, gear-shop and bench-shop, 78,635 square feet; extension to machine-shop, tool-room, gear-shop and bench-shop, presently building, 92,820 square feet; power-house, smithy and plating-shop, including basement, 29,540 square feet; painting, lining and varnishing shops, including basement, 40,430 square feet; coachbuilding-shop, including basement, 62,200 square feet; chassis-shop, including basement, 30,400 square feet; gas plant, 8,400 square feet; total, 342,445 square feet. The total area works out at just a little under 8 acres.

Some of the other contractors merit to be mentioned. The whole of the blinds were made by Messrs. James Meighan & Son. The railings and gates were supplied by Mr. Ure; the granite, concrete, and marble was supplied by Messrs. Scott and Rae.

"THE COUNTRY IN TOWN" EXHIBITION.

THIS exhibition, which was opened by the Princess Christian at the Whitechapel Art Gallery on the 5th inst., and remains accessible to visitors until the 18th inst., originated with Miss K. M. Hall, the curator of the Stepney Borough Museum, while Mr. W. M. Webb, of the Selborne Society, literally created it. The aim and object thereof is educational in the fullest sense, and to show what can be done in the schools; also to create an appetite for better things with the view of changing the whole face of certain districts in the East End of London. The Town Council of Dresden have sent a plan, scale 1/100,000, with coloured projection of the children's playgrounds, and a view of Dresden after Kuchl's picture, with several prints and photographs, &c.

CROSLAND HILL STONE, HUDDERSFIELD.

Best Crosland Hill Stone, suitable for all classes of good work, specified by most leading Architects for Church Work and Public Buildings.

Show Rooms:

4 UPPER THAMES STREET, LONDON, E.C.

One room is devoted to plans and illustrations of garden cities and suburbs. Two large coloured scene paintings represent a suburb of London built in the usual manner, the houses close together in long monotonous lines, and the proposed Hampstead garden suburb, where there will be only eight houses to the acre. Then there are illustrations of cottages, &c., at Bournville village and Port Sunlight. Professor Patrick Geddes contributes views of suggested improvements at Dunfermline and Edinburgh. The Garden City Association have sent illustrations of the first garden city, plans and models, while Messrs. Raymond Unwin and Mr. Barry Parker also contribute illustrations of proposed cottages. A model of a country house by Mr. J. W. Rhodes, architect, is likewise on view.

Mr. Imre Kiralfy shows plans and pictures with the view of improving and beautifying the East End of London, more particularly Mile End Road, Spitalfields and Shadwell. The London County Council and the Metropolitan Public Gardens Association are, moreover, largely represented, and several well-defined photographs of views in London parks are contributed by Mr. W. H. Golding.

VARIETIES.

THE foundation-stone of the Lambeth town hall will be laid by Alderman Powell, the mayor, on the 21st inst.

THE Stretford District Council are about to erect 110 houses for the working classes at an estimated cost of 25,000*l*.

THE Portsmouth Council have decided to lay out ornamental grounds at Southsea, and to erect chalets similar to those erected on the beach.

THE extensive paper mills of Messrs. Wiggins, Teape & Co. at Dover were destroyed by fire on Tuesday last. The damage amounts to many thousands of pounds.

BRUCE HOUSE, which was erected by the London County Council at the corner of Kemble Street and Drury Lane as a lodging house, will be formally opened to-day (Friday).

A FOLK HALL is to be erected at Earswick by the Joseph Rowntree Village Trust from the designs of Messrs. Parker & Unwin. It will consist of main hall, 44 feet by 65 feet ;

club wing, 52 feet by 30 feet, two storeys high ; caretaker's house and bar parlour wing, 42 feet by 30 feet.

A BRONZE statue of the late Joseph Cowen, for many years member for Newcastle, was unveiled on Saturday afternoon in the Westgate Road, Newcastle, by Viscount Ridley. The cost was defrayed by public subscription and the sculptor is Mr. John Tweed, of London.

THE works committee of the Newport Corporation recommend the erection of a three-storeyed building on the Corporation land in Dock Street, opposite the town hall, at a cost of 4,900*l*.

THE Portsmouth Corporation have agreed with the Government authorities for the cost of carrying out the scheme for a more effectual drainage of the low-lying portion of the district, and work is to be commenced at once.

THE new waterworks for Rushden and Higham Ferrers have been completed and opened. They were carried out from the plans of Mr. R. E. Middleton by Mr. A. E. Nunn, of Finsbury House, at a cost of over 100,000*l*.

A PETROL motor fire-engine, built by Messrs. Merryweather & Sons for the Glasgow Fire Department, was tested on Saturday last with satisfactory results. The large quantity of 28,800 gallons of water per hour can be delivered.

THE works committee of the Marylebone Borough Council recommend that a double row of trees be planted down the centre of Portland Place. When the residents were circularised on the subject, out of 112 thirty-six replied in favour of the proposal and twenty-five against.

JOHN EDWIN KAYE, twenty-seven, a contractor, was killed while testing a well at Crosland Moor, near Huddersfield, on Saturday. He was being lowered into the well, which is 120 feet deep, on a seat suspended from a wire rope. A nut worked off a bolt and the seat fell. Mr. Kaye's head struck the pump shaft.

THE Whitehall Club in Parliament Street, Westminster, is to be sold on July 25. It was built about 1866, and cost some 25,000*l*. The design was by Parnell, and the structure, which is of stone, is in the Italian style. Over the doorway and upon the cornice is some fine sculpture. The club, whose rooms are spacious and lofty, has always possessed an advantage in its proximity to the Houses of Parliament.

Are you interested in WOOD PRESERVATION?

Apply to the ANTHROL Company, Kinning Park, Glasgow, and you will receive an interesting booklet on the subject, which gives a full account of the remarkable properties of ANTHROL and describes the very simple and inexpensive methods by which it is applied.

It is an antiseptic preparation which protects any kind of wood impregnated with it from decay in both damp and dry situations, and from the ravages of all wood-destroying organisms in either temperate or tropical climates.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. ANTHROL does not require expensive pressure-plant ; does not reduce the mechanical efficiency of the timber ; does not increase the liability of the wood to inflame ; does not render the wood poisonous to human beings or domestic animals ; and does not leave the surface of the wood black and unpleasant for handling—on the contrary, ANTHROL, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The ANTHROL COMPANY, Kinning Park, GLASGOW ;
and 6 Cross Street, LONDON.

THE Paddington Borough Council recently discussed a proposal that the works committee should consider the desirableness of increasing by 2s. per week the wages of all permanent employes in the service of the Council who were in receipt of less wages than 28s. per week. The motion was rejected by eighteen votes to twelve.

THE North Dublin Union have directed their solicitor to insert in the advertisements for tenders for the carrying-out of the sewerage and water-supply works for Howth a provision that all materials required for the purpose should be of Irish manufacture, and, if possible, of Dublin make, unless the engineers should satisfy the Council that the materials could not be procured in Ireland. The resolution further directed that local labour should be employed, unless it should not be available in Dublin.

At the Wigan Town Council meeting Mr. Bott moved:—"That in view of the necessity for restricted expenditure all Corporation officials who are in receipt of 300l. or over a year shall have their salaries reduced 25 per cent. from August 1906." He pointed out that in consequence of the recent heavy increase of the rates of the town a great number of the Corporation's workmen had been discharged, and there was no reason why officials who had handsome incomes should not bear some share of the hardship. Mr. Parkinson seconded, and of those who supported one declared that the town was in a bankrupt condition. The resolution was defeated by twenty-six votes to eight.

THE Home Secretary has issued a draft of regulations which he proposes to make under section 79 of the Factory and Workshop Act, 1901, for the manufacture of paints and colours in which dry carbonate of lead or red lead is used. The regulations, which will supersede the existing special rules for processes in the manufacture of paints and colours, follow with some slight modifications the draft issued in March last, which embodied the points agreed upon at the conference between representatives of the Home Office and manufacturers of paints and colours, held at the Home Office on February 1 last. The Home Secretary understands that the draft regulations are now generally such as commend themselves both to employers and employed.

"OFF for the Holidays" is the title of a pictorial poster by which the Great Central Railway Company draws
